THE PACIFIC RURAL PRESS

SAN FRANCISCO Saturday, July 3, 1915 LOS ANGELES

California State Library 1-1-17

California's Jersey Isle.

[Written for Pacific Rural Press.]

A prosperous farmer is usually a contented farmer and those two words adequately describe the farmer in that portion of Humboldt county surrounding Ferndale, in so far as the writer was able to ascertain after numerous interviews with all classes.

When you consider that this contented feeling exists in face of the fact that conservative estimates place the tenant farmer of this section as 90 per cent of the whole, and that these tenants pay $15 to $25 an acre rent per annum, according to the soil and its location, you have just reason to ask, "What do they do and how do they do it?"

Two Characteristic Views of Humboldt Agriculture, Showing Rich Pastures of Clover and Rye Grass in Upper and Corral Milking in Lower. Timber Records Development of Dairying in the County.

Five minutes walk in any direction from Ferndale would answer your question as to "What they do." Everywhere you see Jersey cows and green fields of endless varieties of forage and root crops. We say Jersey cows advisedly, for while all breeds will be seen, 75 per cent of the stock is distinctly Jersey, the result of of continual breeding to purebred Jersey bulls and the selection of heifers from the high-producing cows for many years.

At one time the cows in this county were a mixture of pretty much every breed, Durhams predominating as the early dairymen made their start with them; and the result of careful breeding on their part is still apparent.

Cow Testing and Purebred Sires.—Since the advent of the cow testing association, six years ago, however, the dairymen have based their fortunes on the Jersey; and with one exception those we talked with expect to continue with the breed which has done so much for them. In that particular instance the butterfat average for the herd of 50 cows was between 220 and 225 pounds a year when the testing association was formed six years ago. The increase since then has been gradual each year, as a result of Jersey sires. Last year his herd average was 277 pounds of fat per cow. Notwithstanding an increase of over 50 pounds per cow, this man is changing this year to a sire of another breed. His neighbors think him foolish.

It seemed inevitable that as often as we asked the method of breeding for higher production, just so often we were informed that, "I use a registered sire, test my cows in the association, weed out any poor producers, and substitute in their places the heifer calves out of my highest-producing cows."

This is the doctrine so often preached, but so seldom practiced, and it is a revelation to find dairymen so unanimous in their convictions that they not only preach but also practice. We might add that the dairymen who gave us these answers were visited promiscuously, so we believe they are characteristic of the section, although we were informed that there are some who still follow the old methods of breeding to scrub bulls.

Various reasons are advanced for the progressive spirit which prevails as to breeding; high rentals and continued dairying being the most frequent answer to the question, "How did it start?".

One Man "Bought a Bull"—It is pointed out that some 30 or 35 years ago, a dairyman in the Loleta district (a section adjoining the Ferndale section), purchased a purebred Jersey bull and gradually built up the production of his herd. At that time the native cattle crossed with Durhams prevailed on other dairies; but in the years that followed the Jersey herd proved the more economical producer and the increase in Jerseys has been rapid, especially since the cow testing association was started. It is well to mention that the offspring from that original foundation have been held intact on the same ranch; and the herd, now numbering close to 100, are admitted to be one of the finest, if not the finest, herd in the county.

Co-operation Largely Responsible.—A further reason advanced by one of the leading dairymen for the general improvement of condition, and one which probably has been a controlling factor, is the proximity of the dairies and their past seclusion from other counties. "There has been a closer union of interests here because we have learned from years of personal friendship with one another that to do things together is better than doing them separately. Our Dairymen's Association and Cow Testing Association have done much toward advancing everyone's welfare and have served to bring us into closer relationship with one another to the end that any and all beneficial factors spread more rapidly than elsewhere." Neighborly interest promotes all kinds of good results. Cooperation is without doubt the final analysis of success in this far-away country and being close to one another's business and personal achievements or discouragements has led to a broader view of co-operative endeavor than is common.

A Natural Grass Country.—But why, you may ask, does dairying supersede all other kinds of farming? One day's stay would be sufficient to answer that question. It is a natural grass country. Pastures of white clover and Italian rye grass, 20 years old, are not the exception; and they remain green practically the year through. The climate is naturally cool and damp, the year's rainfall ex

San Diego	.00	14.41	10.01	70	58

The Week.

We alluded last week to the fact that some of our readers believed that state regulation of produce marketing is more important to the producer than rural credit provisions because when a man can market fairly he will not need credit, etc. We dissent from that view. It belongs to that group of errors which are sometimes called "half-truths," which some wise man has declared to be more dangerous than integral lies. There cannot be any movement of produce beyond that which is covered by individual barter or sale, which does not involve credit in some form and to some extent. It is of course conceivable that every producer should be so forehanded and full-pocketed that he can make the crop, insure the crop, gather the crop and transport the crop to a sale-point, putting only his own money into these costly operations; but though this is theoretically conceivable and is actually realized in some cases, it has never been a ruling condition among men. Ever since Cain grew garden-truck and Abel grew lambs and quarreled over the relative credit which each should receive, credit operations have been essential to the feeding of a world—for credit in its essence means simply, faith, trust, confidence in the character of a man, in the responsibility of his operations, and in the intrinsic value of his products. Of course there is a large amount of credit involved in the successful operations of a man who fully finances himself—but we do not pursue that point. The plainer and more concrete fact is that, when you get beyond individual instances which may be otherwise, there can be no great marketing which does not involve credit, and one of the leading achievements in State marketing, if it ever makes any achievements at all, will be the provision or regulation of credit, so that the wages of credit, commonly called "interest," shall be fair to the producer who is forced to employ it. Hitherto these wages of credit have been unfair, even to the point of extortion, and the service has been sometimes withheld or operated to the point of robbing the producer of his equity in the marketable commodity which he has produced. The whole system of advances upon crops has been and still is more or less of this character, even though it often appears beneficent and is really dispensed in this spirit, because to refuse it would impose hardship, perhap ruin. Still, though often given in the kindest spirit and though its morality is assured by the laws of trade, advances are too often cruel exactions in the guise of blessings.

Whence Should Come Advances on Crops?

We will not argue this matter theoretically except to say that an advance should not come from a dealer. It obviously gives inequitable advantage to the buyer in the transactions which follow. It is not always extortionately used; in fact, it is often, we doubt not, administered in a generous, manly and even friendly fashion, but it is, nevertheless, an economic sin that a crop should be handicapped in its race for market value by an obligation held upon it by a certain buyer who has made an advance. Advances should come from those who deal in money and have no object whatever in controlling produce sales. Their business should be to guard their severity and to get the wages for their money. They should not force sales for any speculative motive, nor should they help other speculators to realize from squeezes or other gambling devices. It is idle to argue these points theoretically because the things which we have designated as unworthy have been done since the earliest Pharoah cornered wheat, and since the Chaldean bankers made advances to help speculators get crops. It is a concrete and very important fact, however, that the last few decades have demonstrated in European experience that there are ways in which credit can be secured for cropping and marketing purposes at low rates of interest and wholly apart from dealers' motives and temptations. It is therefore, idle to argue that such a thing can or cannot be done: it is simply a fact accomplished, and a method in operation, in all the more progressive European countries. The advance of money for cropping and marketing purposes in these countries comes now from three sources: first, government funds, administered through special banks created wholly or in part for that purpose; second, rural credit banks and societies, organized, regulated and often underwritten by government authority; third, private or old-line banks, which cried ruin when their historic ways of doing business were interfered with, but have found since that it is very comfortable and profitable to do the new kind of business at half the cost of the old. The most significant fact is that there is plenty of money for loans to farmers properly organized for collective security; that advances from storekeepers and produce buyers have gone out of use; that the money advanced by the government is only a fraction of the amount currently used in short-time personal loans, and that produce sale and distribution, which are now largely effected by growers' organizations under government regulation and supervision, are inseparable from the rural credit systems, without which producers would never have been made free to practice fair marketing. Therefore, we do not agree that a system of market regulation is the only thing or the most important thing to secure rural prosperity. The cornerstone of fairer marketing is fairer credit, divorced from extortion and from buyers' interests.

What the State Can Do?

Some of the smart Alexanders of the commercially endowed press are affecting to laugh at the McPherson bill, because they say it has only a possible $25,000 fund to finance State marketing. They, of course, do not desire to know that the figure stated is a revolving fund—or rather, only a nucleus of one, and that will be plenty to begin with, and there will be plenty more coming if the start made seems promising to the next Legislature. It is not now a question of money: it is a question of how those who wish to introduce into this State modern methods of produce financing and trade, take hold of the proposition. As we stated last week, they can make nothing or they can make everything of it. It is ridiculous to say there is not money enough. There is so much money idle in this State at this moment that city bankers do not know what to do with it. They will not loan it on warehouse certificates because that excellent system of loans, which was legalized and practiced during our grain-greatness of thirty years ago, has fallen into innocuous desuetude. Now they benignly refuse to lend it because they do not desire to encourage farmers to speculate! Great Scott, how noble! But they will lend it to dealers to dole out in their crop-controlling speculations. They are just in the state of blindness that European money-magnates were before public interest compelled the governments to demonstrate that a nation's food supply must be pushed into fair finance and distribution. They will awaken later and will roll their millions into safe and honorable uses just as their European contemporaries have done. In this matter of financing farming, this great United States of ours is now the most provincial nation on the face of the earth, but it will quickly become cosmopolitan if the people will get together and put over a few things which are essential to such a condition.

We are not arguing now that the State should do this or that. We are not yet converted to Nationalism, Socialism, nor Paternalism. We believe in Co-operating Individualism to Get a Fair Deal for Farming! Probably all the State needs to do is to clear the track for that. Probably the chief obstacle to that at the present time is the special privileges which have come to belong to Finance and Trade by the failure to exalt other points of view which they themselves have allowed to lie unrecognized and unprovided for. Just see, for instance, how easily an old special privilege can be swept away in the public interest! It is announced this week from Sacramento that: "For the first time in the history of the State a rate of three per cent on State deposits has been offered by banks, according to State Treasurer Richardson. The State is at present receiving 2½ per cent. There is approximately $1,000,000 to be let out for a term of one year at the three per cent rate." If we are not mistaken it is not long since the banks had this money at two per cent; then 2½ per

P1
181931

cent, and now three per cent. Why? Simply because the State Treasurer has called the old bluff that the money was "on call," and therefore not worth much, and for the same reason not available to promote the State's industries and interests. Like a good many banking dreams the money was theoretically "on call," but actually in for years, and now the State government is bright enough to get nearer what its money is worth by using a few words which have not changed the facts at all. And what does this mean? It means, for one thing, that the surplus money which the State has accumulated for its own security and purposes by taxation of things largely agricultural, either directly or indirectly, is still to go into institutions which are already full of idle money because they have no adequate notion of the security and desirability of industries which could use this money in producing wealth. Such money is used in nearly all modern countries for wise and carefully guarded industrial production and distribution from original sources. We use it in turning over things—in ways too well known to need description, and are simply scared stiff if any one proposes to use State money in any really useful and progressive way.

Intensive Dairying.

These few things we have been trying to say about financial conditions and attitudes have direct bearings upon the development and prosperity of every kind of agriculture which is pursued in this State. Perhaps no more pertinent application can be made than to consider this discussion in connection with the excellent sketch of intensive dairying in Humboldt county which one of our assistants presents on the first page of this issue. What would it mean in State development if all counties suitable were advanced in dairy production as parts of Humboldt county are? Humboldt county has some unique climatic conditions and advantages, it is true, and Humboldt has been advancing slowly ever since early days. But these are not essentials to development, for of the three greatest counties of the State, Humboldt county is on the north coast, Stanislaus is in the central valley, and Imperial, the youngest county in the State, is in the extreme southeast—while the outer points of three counties named are something like 800 miles distant from each other in an air line. Geographically, the dairy is the pervading industry of California, but in considerable areas it is much more thinly spread than the natural adaptations warrant. In other words, it would be of tremendous advantage to the State if modern dairying were pursued far more intensively, with cows better bred and better fed—in each locality according to the local conditions of forage, growth, etc. But modern dairying, with good cows and buildings, good forage crops and outfits for their culture, is a business requiring considerable investment and some working capital. Other things being equal, its profitability will be directly in proportion to the rate at which capital can be secured. Under present credit conditions it is difficult to get money for an outfit of cows except at exorbitant rates and on terms which leave a man little to buy sires for the improvement of the offspring. These things are directly against the development of the State and of individual prosperity. They should receive careful consideration, not only from those who consider themselves broadly as State builders, but by those who are working for local development. There are ways now in operation in the world by which dairy opportunities inferior to those which we have abundantly in California have been developed into national industries, and the result has been attained through association of rural credit with co-operative marketing enterprise. Now that these things hold a prominent place in the public mind, and popular interest seems so widely to approve their realization for the common good, it is surely the farmer's duty to study propositions carefully, and act along the line of his convictions for the advancement of his industry.

Queries and Replies.

Querists must give name and address.

Inoculate Bur Clover.

To the Editor: Is it profitable to inoculate bur clover seed before planting, to increase its yield? I aim to reseed a worn-out pasture that has never been plowed and has no irrigation. The land is red and bakes as hard as an ordinary brick, and produces nothing but a light crop of wild oats and foxtail.—R. E. M., Woodlake.

On land that has never been cropped and is so poor that it will not raise good crops of wild oats or foxtail, you will have poor success the first year even with bur clover. If you plant bur clover, be sure to work up the soil deeply and finely; and then, because none of it has been growing on the land, it will be practically necessary to inoculate with bacteria, most conveniently applied in the commercial forms. Where the ground has baked so hard, bacterial life has probably been largely destroyed. Mixing the burs with horse manure was found to produce good germination on a Placer county fruit farm. It would be well to fertilize the ground with manure.

Making a Virtue of Bermuda.

To the Editor: Can you tell me of a good method for eradicating "Bermuda" grass of a long-standing growth from moist river bottom land? Do you think Egyptian corn is a profitable crop to sow on rich bottom lands?—F. M. C., Oakdale.

We know no way to get Bermuda out of such land, except by a long process of fallowing and weekly under-cutting to prevent the Bermuda from ever seeing the light. But you can work in other plants to fight Bermuda and make good forage or pasturage with them. If the water is not too near the surface, alfalfa will fight it with chance of keeping a good hold if started in February when the Bermuda is dormant. If water is too near the surface, red clover will work instead of alfalfa. Sorghums will all be glad to grow on rich bottom land of course, but on such land Indian corn would probably be more profitable. Neither would, however, do much on Bermuda sod until after the killing process.

Trees Bearing Too Young.

To the Editor: The article, "Making Apple Trees Bear Young," on page 628 in Pacific Rural Press of May 29th, interests me very much. I have four apple trees in their second summer and they are in blossom and two of them are bearing. One apple tree bore one apple last fall. All my trees were pruned last March. Ought I prune them now, as per illustration on page 628? I also have two Early Crawford peach trees and two almond trees and two plum trees, all bearing. Would it be best to cut off the fruit and nuts, and should these trees be pruned now again? We have one Navel orange tree in blossom and with many little oranges. This same tree, now in its second summer, bore seven big oranges last winter. Would it be best to take some of the little oranges off now; if so, what per cent? I am treating my blackberry vines as per article in the Press of May 22nd. Should Himalaya berry vines be cut back in order to grow laterals? Last summer the canes grew from 15 to 20 feet, with but very few laterals and only a few berries here and there. I cut back a few canes the day I read the berry article, and now it is full of laterals, whereas before it had only leaves. Last year I planted an English walnut tree and it rotted at the roots last month. Last March I planted another one and it now looks the same as when planted, except it is getting dry and black at the top. I think it is dying at the top. Should I cut it back down to where it is still green?—P. S. H., San Ysidro.

Summer pruning of young trees can only be commended for those which are making very strong wood growth and can stand checking and forcing of new laterals. The precocious bearing of your trees shows that they are of too weak growth and have not sap pressure enough to make strong young wood. They probably do not get water enough to be strong and healthy. Do not summer prune at all, but irrigate and cultivate well and see if you cannot make them grow more strongly. Unless you are running a museum of early bearing, take off the fruit and let the force of the tree go into wood until a year or two older. Himalayas do not need cutting back except for convenience. The long canes make laterals the second year and these bear fruit several years. They are not like other blackberries, which need renewal of wood every year. You will probably not get fruit any sooner by your cutting back, but it may be more conveniently placed. If you wish the greatest amount of fruit, let the Himalayas make a good run and then chase the fruit around the ranch.

Wheat in Upper San Joaquin.

To the Editor: What variety of wheat would you advise planting on heavy red soil eight feet to water. It has been sheep-pastured two years. Should it be summer fallowed? Is wheat successfully treated for smut and rust? If so, how? Is the future outlook of wheat good?—R. G., Sanger.

We should grow Sonora wheat, which constitutes something like three-quarters of the wheat crop of your district, and has for years demonstrated particular adaptation to your conditions. It is not necessary to undertake the treatment of the seed for rust for such treatment is not likely to effect anything if rusting conditions prevail in the spring. These are not usually to be expected in your district, therefore Sonora, though liable to rust, is safe in your region. The seed should be dipped to kill smut spores. Dip in a solution of bluestone, one pound to four gallons of water. Be sure the seed is thoroughly wetted, and then dry as quickly as possible by exposure to the air. We should disk the land to a loose surface as soon as convenient and surface work it later, if weeds start during the summer. If weeds do not start until the early rains come, kill them out once or twice to clean the land before sowing the wheat, which should be done in November or December, according as moisture conditions are right for a sure start. We consider the outlook for wheat good in this State. We are only growing a part of the amount we need for State consumption.

Home Canning: Fruits and Vegetables---VII

[Written for Pacific Rural Press by Prof. W. V. Cruess.]

Peaches. — More peaches are canned than any other fruit. They should be ripe but not soft. Commercially the fruit is graded into five grades or more; in home canning three grades should be sufficient. These could be Extras (the largest and most perfect fruit), Standards (fruit of medium size and good quality), and a Pie Grade (consisting of blemished, small and soft fruit).

Nearly all commercially canned peaches in California are peeled by the lye process. The fruit in this method is first cut in half, pitted, and run through boiling lye solution which loosens the skin. The skin and excess lye are completely washed off the fruit by thorough spraying and washing with cold water. The strength of the lye is about 10 per cent. The lye strength and time will vary with the ripeness of the fruit. The flavor of the fruit does not appear to be noticeably injured by this method and it is just as wholesome as hand-peeled fruit. If large amounts of peaches are to be canned, this method is recommended; if only small or moderate amounts are to be canned, they may be peeled by hand. If the lye process is used, great care must be taken to wash out all the lye or the fruit will turn black in the can.

Peaches are peeled by hand with a specially made knife equipped with curved blade and guard to insure uniform depth of peeling. The hand-peeled peaches are then pitted. The pits of freestone peaches are easily removed, but clingstone pits require a special instrument known as a "pitting spoon" to make a neat-appearing product. Any hardware store or canning supply company can furnish or easily obtain the peeling knife and pitting spoon.

Number 2½ cans are most commonly used for the peaches canned in syrup, while the gallon or No. 8 or No. 10 cans are used for the Pie Grade. All styles of jars are also suitable. If jars are used, the fruit may be built up in neat overlapping tiers; this gives a very attractive appearance and is to be preferred to haphazard filling of the jar. The same applies to apricots. The fruit is then covered with syrup.

Making Syrups. — The highest grade of peaches is given a syrup varying from fifty to sixty per cent sugar; usually the high grade sliced fruit is put in a sixty per cent syrup and the highest grade halves in a fifty per cent syrup. This would be 50 and 60 Brix, or 27.7° and 33° Baume, respectively. The remaining grades receive syrups decreasing in 10 per cent intervals between grades to Pie Fruit, which is put up in water. For home-canned fruit, the Extra grade would receive a fifty per cent syrup; the Standard, a 30 per cent syrup; and the Pie Stock, plain water. 30 per cent equals 30° Brix and 16.8° Baume. To make 100 lbs. syrup of "a" per cent strength take "a" lbs. sugar and (100—a) lbs. water. For example, to make 30 per cent syrup take 30 lbs. sugar and 100—30 (or 70) lbs. water. Dissolve sugar and resulting syrup will contain exactly 30 per cent sugar. 1 gallon of water equals 8.34 lbs. For practical purposes, one pint of water equals one pound.

Cooking Fruit.—The cans or jars are treated as described for cherries. The cans may be exhausted six minutes at 212°F. before tipping. They should be cooked long enough to cook the fruit through. The time necessary will vary from 10 to 25 minutes at 212° F. for No. 2½ cans, according to variety and texture of fruit. Freestones take less time than clings. Gallon cans will require about a 30-minute cook. The fruit in jars is cooked as described for cherries. The fruit in the jars can be tested during cooking and removed from the cooker when properly cooked. Peaches are easily sterilized, and when cooked through either in cans or jars at 212°F. will keep indefinitely, if micro-organisms are excluded thereafter.

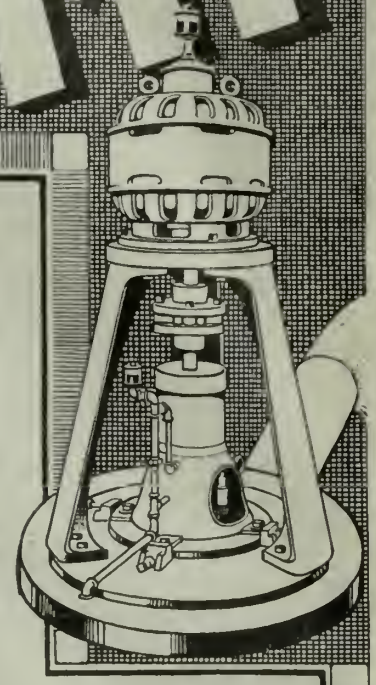
Apricots. — Apricots receive the same general treatment as peaches with the exception that they are not usually peeled; if peeling is done, it is carried out ordinarily in a lye peeler. The fruit is graded for size and quality into the same number of grades as peaches. It is thoroughly washed, pitted, filled into cans, or jars, covered with syrup, and processed 212°F. in the same way as peaches.

The usual process for apricots in No. 2½ cans is, 10 minutes for Moorpark and 8 minutes for Blenheim at 212° F. for fruit of medium ripeness; soft fruit requires about 2 minutes less and hard fruit several minutes more.

Owing to the high acidity of the fruit, only enamel-lined cans and glass jars should be used.

Pears.—The Bartlett is far superior to the hard varieties, such as the Kiefer for canning.

The pears should be ripe, but firm. They are peeled by hand, cut in half, and the cores are removed with a coring spoon. The fruit should be graded into about two sizes and the blemished fruit canned separately as pie fruit. The peeled pears oxidize rapidly in the air and turn brown. This brown color should be washed off in cold water as the fruit is put into the can or it may persist after cooking. If the peeled fruit is kept under water until wanted, it will not color nearly so rapidly.



The highest grade of pears should be given a 40 per cent (40° Brix or 22.3° Baume) syrup. The second grade would receive a 30 per cent syrup, and the third, or pie grade, plain water.

Pears in No. 2½ cans are exhausted 7 minutes and are cooked after tipping 16 to 35 minutes at 212°F. If the fruit is hard, the longer time may be necessary; if medium softness, 16 minutes will be sufficient.

Blackberries.—These may be handled practically in the same way as strawberries. The Mammoth will not require quite so heavy syrup as strawberries, while Himalayas require a great deal of sugar to counteract their high acid. Enamel lined cans or glass jars only should be used because of injury to color from tin.

Raspberries may be treated practically in the same way as strawberries with good results, although the syrup in most cases will be of lower

Layne & Bowler PUMP

You don't buy cumbersome trouble-giving machinery when you buy a Layne & Bowler Pump. You get the most compact, simple, efficient pumping plant ever built—a pump you can ALWAYS depend upon, no matter how rigid your requirements are. The thousands of installations we have made during the last few years offer splendid evidence of the wonderful service the Layne & Bowler Pump gives. In all parts of the West—in fact, in many parts of the world, you'll find the Layne & Bowler Pump, giving the utmost satisfaction. It is the cheapest water producer today. Write for Catalog No. 25. It gives valuable pump information.

See our big exhibit of pumps in the Palace of Machinery, San Francisco Exposition. Every rancher and prospective irrigator should see this interesting and instructive exhibit.

Layne & Bowler Corp.

900 SANTA FE AVENUE, LOS ANGELES.

The kiss of the Sun for pardon,
The song of the Birds for mirth—
One is nearer God's heart in a garden
Than any place else on earth.

California Garden Flowers,

TREES, SHRUBS, VINES.

By E. J. Wickson, A. M.

is just what you need as an aid in your every-day work in the yard. It is written by a Californian who knows, to meet your conditions. It tells the how, when and why, and is very practical in its suggestions.

Do you realize the contentment, happiness and profit gained by a well-cultivated garden?

The book is divided into six divisions and these parts are divided into twenty-six chapters, which cover California conditions, cultural suggestions, California garden year, ways with garden plants, shrubs, trees and vines, methods against pests and diseases.

The work contains 258 pages of closely packed information of absolute value to plant growers, besides numerous illustrations — handsomely bound in cloth. Price, $1.50 postpaid.

Pacific Rural Press, Publishers

525 MARKET STREET, SAN FRANCISCO, CALIF.

Change the waste places in your yard into a garden. It grows while you sleep.

sugar content than for strawberries

Plums.—Green Gage, Washington, Egg, and Lombard plums are most commonly used for canning. The fruit is graded for size and quality, washed and stemmed, but not pitted. The highest grade is given a 50 per cent (50° Brix or 27.7° Baume) syrup. If three grades are made, the syrups would be 50 per cent, 30 per cent, and water, respectively. In No. 2½ cans, the fruit is given an exhaust at 212°F. for 6 minutes, tipped, and processed; that is, sterilized for 14 to 17 minutes at 212° F., the time varying with the texture of the fruit. Enamel cans or jars should be used because of the high acid.

Weather May Reduce Walnuts.

[Written for Pacific Rural Press by C. Thorpe, Manager California Walnut Growers' Association.]

It is of course too early as yet to form a conclusive opinion as to the probable outturn of walnuts in California for the 1915 season. Therefore any statements made herein depend upon climatic and other conditions continuing favorable from now until harvest time. It should be distinctly borne in mind that walnuts are a product of Nature absolutely; and the development of the crop is highly dependent upon climatic conditions and also upon the degree with which bacterial and fungus diseases may develop. Unfavorable weather conditions for a two or three days' period may curtail the expected crop as much as 30 per cent. Conditions at present, however, are favorable for a normal crop and a fairly early harvest. It should be observed here that we have not had a normal production since the season of 1912. Up to the middle of September, 1913, prospects were promising for a record breaking crop of about 13,500 tons for that year. Two excessive hot days about the middle of September damaged the crop and the trees so severely that the output was curtailed fully 20 per cent, shipments reaching only a little over 11,000 tons for that season; and the quality of the deliveries was greatly deteriorated. The heat in this short period was so severe as to kill much of the fruit wood on the trees, so that the 1914 setting was very light also, the crop for that season being less than 9,000 tons for the state, the lightest production for many seasons.

Bearing Acreage Increased.—Since the occurrence of this freakish weather two years ago the bearing acreage of walnuts in California has been gradually increasing, this increase in bearing trees now being estimated at 17 per cent more than in 1912, the year of the last normal crop. There is considerable variance in opinions regarding the extent of the crop this season. I feel that it is safe, however, to state that the production can hardly be expected to exceed 13,000 tons provided conditions remain favorable. Total shipments below this figure would not be surprising. If the crop develops to this maximum figure it will be the largest crop by 5 per cent that the State has ever produced. Of the total California production the California Walnut Growers' Association expects to market not less than 70 per cent.

DRIED PEACHES 13 CENTS.

[Written for Pacific Rural Press.]

At the Morgan Hill Farmer's Union picnic recently a youthful farmer, George Brooks, told us how his folks sold peeled dried peaches at 16 cents per pound, and how they handled them.

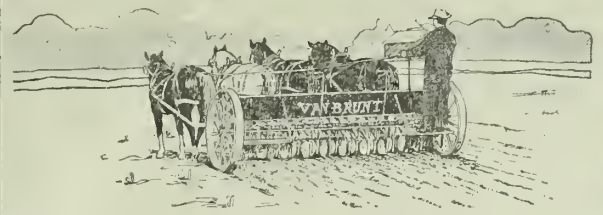
A friend in Philadelphia had worked in a grocery store and asked Mr. Brooks if he could furnish some dried peaches direct from the farm. The Philadelphia grocer offered 16 cents a pound for the peeled peaches. Eleven hundred pounds out of the crop from over 900 trees were sold at this rate last year, Mr. Brooks paying the 3 cents per pound freight, and a contract is signed for about a ton of peeled peaches to be delivered this year.

Mr. Brooks made more from the 1100 pounds than from all the rest, which was sold at the farm at 3½ cents.

But Sales Manager G. A. Bolster of the California Cured Fruit Exchange wishes to emphasize the fact that in the ordinary channels of trade, peeled peaches cannot be sold at a price which will cover the extra cost of production. The Exchange still has most of its small quantity of peeled peaches on hand.

As Mr. Brooks handles the drying, it would not seem to increase the cost of production so materially as it increases the price to him when he sells direct to the retailer.

The fruit for drying peeled must not be too ripe or soft, yet must be ripe enough to take the sulphur well. It is picked and cut the same as any other dried peaches, and thoroughly sulphured, at least three hours. As soon as the fruit comes out of the sulphur house, each half peach is picked up in the left hand right side up so as not to spill the juice, and with the fingers of the right hand, the skin is slipped off and the peaches are set down on the tray again. Only clean white pine trays are used; otherwise, the fruit would be stained or turned black, especially on redwood. On about the fourth day in the sun, that is, after the juice has dried into the peaches, they are turned upside down by hand and no trouble is experienced with their sticking to the trays. As soon as they are dry enough so that a double handful squeezed in the hands will fall apart when the hands are opened up, they are ready for shipment.



Mr. Brooks uses boxes which hold 100 pounds, strongly made so that they do not break in transit. Heavy wrapping paper lines the boxes, and the peaches are packed without any resteaming or resulphuring.

A source of loss in this system is the fact that peeled peaches dry away to 5 or 6 to 1, while the unpealed ones 4 or 5 to 1.

This would seem to be a promising field for those who have peaches that can be dried, provided they can establish eastern connections and sell direct to the retailers or to the consumers.

Bean thrips infesting beans and alfalfa in Los Angeles county are held in subjection by sulphuring. In Shasta county, the same insects on all garden vegetables are controlled with tobacco spray, while in Tehama county both oil emulsion and tobacco sprays are used.

John Deere Implements

Van Brunt Single Disc Grain Drills

Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

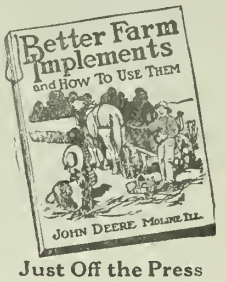
Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed—the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.

Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.



Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X - 152.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

John Deere Publicity Department, Moline, Illinois

RECEIVER'S PUBLIC SALE
of
Nursery Stock
To be held at Claremont, Cal.
Wednesday, July 7, 1915

Peaches, Pears, Apples, Olives, Citrus and a large variety of Deciduous Fruit Trees, Ornamental Plants, Shrubs and Trees, Roses, etc.—to be sold to the highest bidder, at office of Claremont Nurseries, Twelfth Street and Indian Hill Blvd., City of Claremont, Los Angeles County, California.

All stock is divided in blocks and will be sold as it stands.

Particulars regarding parcels, contents of each parcel, and any other information regarding the sale will be furnished upon application to the Receiver.

Possession is acquired on day of sale, and growing stock may remain in the field until the next digging season, by making arrangements with the present owners of land. Labor can be arranged for, by contracting with responsible parties, now in the employ of the Receiver.

Sale continued to following day, if necessary.

TERMS: One-third of purchase price at time of Sale. Balance in Ten Days.

A. D. THORBURN, Receiver

CLAREMONT NURSERIES, CLAREMONT, CAL.

Yellow Citrus---Gophers.

[Written for Pacific Rural Press.]

Citrus trees turn yellow from any one of many causes, such as gum disease, roots choking themselves, marly subsoil, lack of drainage, etc. But in San Fernando valley, H. E. Wilkinson says that the trouble is usually gophers. They often kill the tree quick, but sometimes the yellowed tree may have been gophered years ago, but strugglingly survived.

One of his tangerine trees had a full crop last March, but very few leaves. It was "on its last pegs," its roots having been practically encircled by gophers.

"You can't depend on poison," says Mr. Wilkinson, "because we can't know for several days if we have destroyed the animal, and by that time irreparable injury may have been done."

He traps every day or two, using Macabee spring traps, which are set into the holes so that gophers run against a wire which lets two jaws snap; and he is sure then that he has the gopher. As Mr. Wilkinson says, the gophers travel alone; so that if he catches one, he is pretty sure the tree will not be further damaged for awhile.

OLIVE SPROUTS AROUND GRAFTS.

To the Editor: When you graft olive trees, should you keep cutting or breaking off the clusters of suckers, which come out on the limbs? Or should one let them grow part of the summer? Also, do you think it necessary to irrigate them?—G. F. R., Fresno.

[In grafting or budding olives, it is desirable to irrigate them a week or ten days before and afterwards in order to supply plenty of sap for the union and for starting the new growth. The suckers and branches which come out from the old stock will be of service in so far as they shade it and draw sap up to the bud or past it. Sprouts below the bud will tend to rob it and are dangerous to leave. Those which grow from the stub above where the bud has been placed will serve for a short time to draw sap, but if allowed to grow too rankly or too many of them, they too will rob the bud. The same principle is applied to grafts. As soon as the new shoots from the graft or bud are enough to shade the tree or draw their own sap, the rest of the growth of the old variety should be cleaned off.—Editors.]

GOOD REASONS FOR GOOD DRIED APRICOTS.

To the Editor: In regard to the high quality of our apricots, there are three good reasons:

(1) Climatic conditions are ideal. Very little fog to encourage scale and fungus diseases, clear warm weather during drying gives the fruit its fine color.

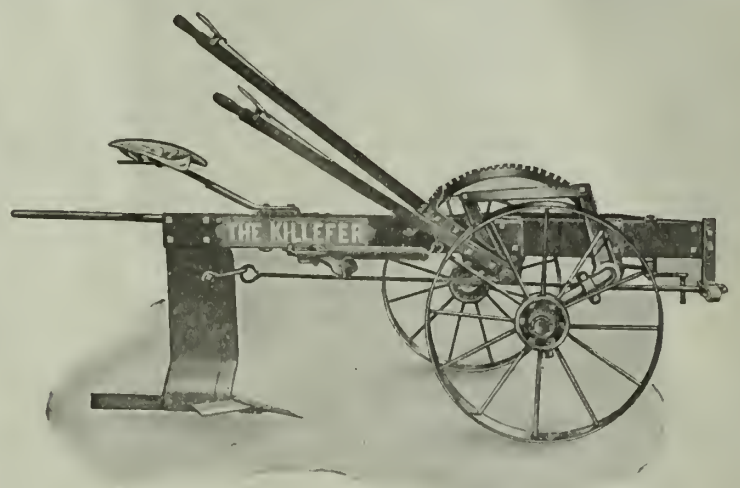
(2) Our deputy County Horticultural Commissioner is constantly on the lookout to prevent the introduction of diseases. Nursery stock shipped in is carefully inspected, and boxes of fruit shipped in by shippers and outside canners are fumigated before unloading from the cars.

(3) Our growers strive to take the best care of their trees and fruit. The fruit is picked from the trees at the right stage of ripeness. It costs very little more to pick from tree than to shake onto canvas, as is the practice in some districts, and it is impossible to shake the fruit off without getting some that is too green. Green fruit makes very poor dried fruit, and overripe fruit makes slabby dried fruit. In pitting, the apricots should be cut all around and carefully laid on clean trays.

Hemet. E. O. Eggen.

BATS AND OWLS INSTEAD OF ORCHARD SPRAY.

To the Editor: Several years ago there appeared in the Sunday's "Examiner" an illustrated article on bats and bat manure, copied from a Texas paper, I think. The article in question claimed that a Texan college of agriculture had built a number of bat roosts, or batteries as they were called, for the purpose of collecting the manure, and that they were an effectual check upon the plague of mosquitoes infesting that particular district. About that time I took a trip to Victoria, B. C., visiting a brother, who lived 7 miles out, and found that though the woods and bush were full of mosquitoes, around the house and buildings, where the bats held sway at nightfall, there was scarcely any mosquitoes to be seen, heard or felt. The bats, which were unusually large, were to be seen flying about in hundreds. His orchard also was kept clear of codling moths, by these bats, I imagine, as it was pronounced free and clean by the Government inspectors, while other orchards were condemned and the fruit destroyed. I have often thought that if we had a colony of bats and owls in every orchard, we should not have to spray our trees, thereby killing both friends and foe by poisonous sprays. What do you think of it? The owls would clean out rats, field mice, gophers and squirrels more effectually than poisons and traps if they were properly protected.



San Jose. Sam'l Haigh.

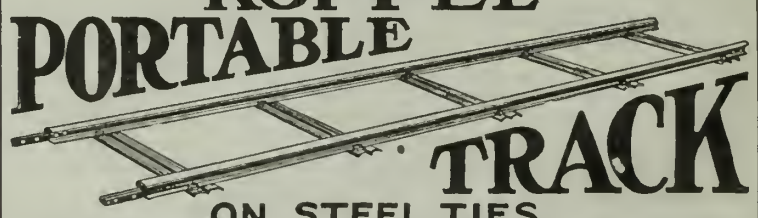
There is a brisk demand for fruit pitting machines, according to Berger & Carter, who sold ten of their machines within ten days recently in the Vacaville district alone.

One Row Beet Plow

KILLEFER QUALITY

KILLEFER EFFICIENCY

Was designed for the smaller grower where horse power was not available for handling the larger two-row plow. The draft is very light and no more weight has been used than was necessary to give the proper strength.



The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.

We build this plow with either straight, sloping or bent standards and with any style of wing or point required.

Superintendent Wants Position

Do you need a man who can produce the best results from your farm or estate; a superintendent who understands the science of farming and can apply it; one who has managed farms and estates in New Zealand, Mexico and Germany, and who is thoroughly familiar with California farming conditions; a man who can stop the small financial leaks that soon run into money.

I am the one you want. I am well educated; married, and am now engaged in the banking business. I expect to sacrifice some salary for the sake of getting in the country. I will furnish the best of references.

Address

FARMER,

Care Pacific Rural Press, San Francisco, Cal.

Santa Clara Growers' Committee.

In regard to prunes in California, conditions appear to lower rather than raise previous estimates of the crop. Growers generally are feeling that the fruit is largely on the outside branches and ends of twigs and that the first heavy picking will show serious shortage in orchards previously thought to have fair crops, the extremely heavy foliage of this season being responsible in great degree for the bending of the limbs.

The Oregon and Washington crop, while not perhaps coming in direct competition with our own, has yet an influence on prices and it is now conceded to be smaller than earlier estimates.

Servia, owing to war conditions, will be unable to market their crop, even if able to harvest it; and the French crop, which is known to be but half or less, will all be used at home and possibly to a small extent in England. California prunes, even at the living prices for which we are standing firm, will, despite excessive freight rates, be cheaper in Europe than their local product.

We are told by the short selling packers that our prunes can only be sold at the low prices at which they sold short around blossom time. This is false; those who are short are endeavoring to fill at our loss. This is the more clear when we realize that last season's crop sold at better than a 5c basis average through the State in spite of the largest crops of apples, pears, peaches, oranges and grapefruit ever produced in this country; and that within the past few weeks the entire holdover has been sold and is now being shipped largely to England, at a 5¾c basis or better.

This season the conditions as to these other fruits are entirely different. Even before the recent storms the Eastern apple crop was light, and these storms have now further reduced both apple and peach crops throughout the East, making much less competition for our dried fruits than last season.

That this short selling at prices ranging from 3¼c to 3½c basis for 40-60s has taken place to the extent of at least a thousand cars is a matter of common knowledge—as to a small portion of this, we have seen some of the contracts and know the prices at which our product (your product) has been gambled. With this knowledge comes also the certainty that if the growers will hold firm, there is no question but that they will obtain living prices for their fruit.

The apricot crop appears to be lighter than was thought, but the situation has been taken in hand by a growers' organization originating in Cupertino.

J. H. BONE, Chairman.
H. O. H. SHELLEY, Secretary.

APPLE LEAVES DWARFED.

To the Editor: Am sending you some apple twigs which are covered with a furry stuff, and the leaves just put out a little way and then die. They were affected this way a little last year, but are much more serious this year.—J. L. B., Stonyford.

[Your apple twigs are affected with powdery mildew, a fungus which winters over in dormant buds. That is why the leaves from these buds are dwarfed and of little value. W. H. Volck of Pajaro Valley recommends iron sulphide mixture prepared cheaply at home at considerable labor, but "atomic" or "milled" sulphur will work just as well. You are too late to do any particular remedying this year except to prune out infected twigs to prevent its living through the winter. Early in the spring is the time to spray for mildew in connection with the first codling spray.—Editors.]

WALNUTS IN THE NORTH.

[Written for Pacific Rural Press.]

One would scarcely expect to find Santa Barbara seedling walnuts bearing superior nuts as far north as Humboldt county, yet Everett Wilder's father planted some trees in a sheltered valley of northeastern Humboldt, 32 of which have been bearing for 25 years.

The nuts are all sold to local dealers in Eureka and Arcata, though it will be necessary for them to ship as soon as the 600 young trees now beginning to come into bearing produce commercial crops. At that time they expect to become members of the California Walnut Growers' Association.

Efficiency

An organization along broad and liberal lines for a nation-wide, safe, and sane distribution of tree and vine fruits. Our services are available through our associate members to any and all shippers of fruits.

PROBABLY LACK OF DRAINAGE.

To the Editor: What is wrong with my young apple trees? They start to leaf out in the spring, then they start to die from the ends of the limbs, and the leaves all dry up. The bark turns brown.—Subscriber, Groveland.

[It is probably due to lack of drainage which holds the soil full of winter water which causes decay of the root-hairs. This water may soak in from rain (or as you are pretty well up in the world, from melting snow). Your trees may be at the base of a slope and thus get too much water by seepage. Where trees act that way the soil should usually be under-drained before replanting.—Editors.]

LEMON STOCK FOR ORANGES.

To the Editor: Kindly advise me if orange trees on lemon roots are considered to be a good union as to growth and fruitage.—A. E. C., Orosi.

[Oranges on lemon roots are not to be considered in California on account of the gum disease which attacks lemons much worse than oranges. Wild sour orange seeds make the stock for practically all of the up-to-date planting, since it makes a good union with all commercial citrus varieties and is as hardy as any. We expect to have an article on citrus stocks in the near future.—Editors.]

SAND FOR LEMON PLANTING.

To the Editor: I see "A Reader" from Dixon asks in regard to planting citrus trees. I had the same trouble for 3 years, so last year I dug good holes and after placing the tree where I wanted it to stay, I had a wagon load of sand ready to move to each hole. I put around the balled roots four heaping shovelfuls of the sand, finishing with other soil, and did not lose a tree. This year I bought some of those trees you had advertised from the South for 25 cents per tree, and better trees I never saw. I planted March 27 and every one lived. Everything starts better in sand somehow.

Make Rain Keep Your Crop Growing

We manufacture sprinklers for almost any kind of irrigation, Lawn, Park, Garden, Orchard or Field; **specially for Alfalfa.** This irrigation by sprinkler is suitable for any land, level, hillside, or sandy soil. The water is thrown high in the air and drops on the land as natural rain. The advantages of this system are great labor saving, economy of water, and it leaves the land free to cultivate. To accomplish this we designed such sprinklers as will cover the largest area with any given pressure at the same time properly distribute the water over the area irrigated. Of course you must have water pressure. With heavy pressure and one of our large type sprinklers you can irrigate one-half acre per unit. When writing it is absolutely necessary to give all details of water pressure and supply, also purposes intended for. We want to demonstrate this system. Address all communications to

Mechanical Power on the Farm.

FIGURING IRRIGATION QUESTIONS.

[Written for Pacific Rural Press.]

"What capacity should my proposed pump or well have?"

That depends on acreage, rainfall in your section, your soil, the crop grown, the investment desirable, which if less, will increase the other factor—the number of hours' labor per month to be used for irrigation. The horse power required to run the pump will depend on its capacity and type as well as the distance water must be lifted, if matters are not complicated by sand, mud, etc.

If for example, the crop needs 24 inches of rainfall per year equivalent to 24 acre inches of irrigation, and if 12 inches of rain does fall, then 12 acre inches of irrigation will be needed. Proper allowance must also be made for evaporation and seepage. If this is best applied in four equal monthly irrigations during the dry season, it will be equivalent to 3 acre inches each time. If 20 acres are to be irrigated, this will require 60 acre inches per month.

If you can spend 10 days of 8 hours each, or 80 hours per month irrigating, you will need a pump and well able to supply 60 acres inches in 80 hours or 6 acre inches in 8 hours. By reference to the accompanying table, you will find that 6 acre inches supplied in 8 hours requires a pump capacity of a little over 339 gallons per minute.

On the other hand, the same table is useful in answering such questions as this: "How much water equivalent to inches in rainfall does a pump throwing a thousand gallons of water per minute furnish 200 acres if running continuously?"

A thousand gallons of water per minute for 8 hours as shown by the table supplies practically 18 acre inches. Running continuously, it would equal 3 times 18, or 54 acre inches per day. If you want to water the 200 acres once every 20 days, you will water 10 acres per day, getting 1-10 of 54 acre inches or 5.4 acre inches per acre equal to 5.4 inches of rainfall for each irrigation.

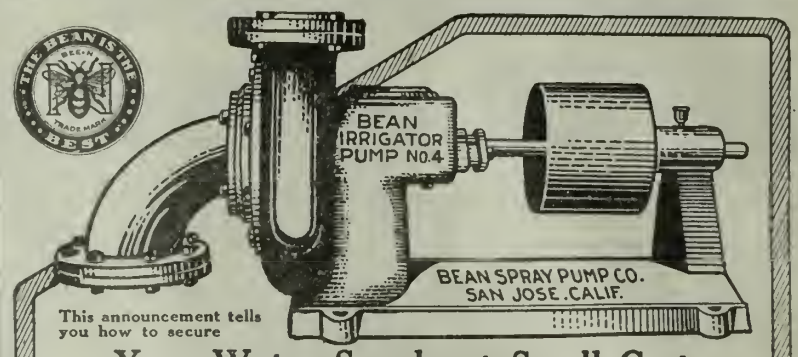
Again, one may want to answer the question: How long will it take to apply 2 acre inches on 100 acres (or 200 acre inches) with a pump capacity of 450 gallons per minute?

Reference to the table shows that 450 gallons per minute for 8 hours is equivalent to 8 acre inches or 24 acre inches per day running continuously. To apply 200 acre inches requires as many days of 24 hours as 24 is contained in 200, or 8⅓ days.

LAND IRRIGATION TABLE.

Acre inches, their equivalent in gallons; and pump capacity in gallons per minute, necessary to deliver the stated quantities of water in one day of 8 hours. A miner's inch equals nearly 9 gallons per minute.

[Arranged by Wm. H. Kritzer.]



Acre Inches	Gallons Water	Gals. per Min. For 8 Hours
1	27,152	56.57
2	54,304	113.16
3	81,456	169.74
4	108,608	226.32
5	135,760	282.90
6	162,912	339.48

35	950,320	1,981.30
36	977,472	2,036.88

NOTE—Proper allowance must be made for evaporation and seepage from the ditches, between the pump and the field, which vary according to climate and soil conditions. An acre-inch is a depth of 1 inch over an area of 1 acre, ½-inch over 2 acres, 2 inches over ½ acre, etc.

CULTIVATOR VS. WEED CUTTER.

To the Editor: Which implement do you prefer for cultivating, a good weed cutter, run about 4 inches under the surface, or a cultivator? There are no weeds as yet, but I have been told that a weed cutter does not disturb the surface as a cultivator does, hence they are the best.—W. B. Y., Winters.

[If you have no weeds, and especially if you have no irrigation, we would say that a weed cutter run a few inches under the surface would be better than a cultivator because it leaves the surface smooth, but in the form of a fine dust mulch which

This announcement tells you how to secure

Your Water Supply at Small Cost

At last—a high-grade, efficient, dependable centrifugal pump at a low price. The Bean Irrigator introduces a new standard of pump values. Though the price is as low as the lowest—the pump is "Bean quality" through and through. If you're interested in irrigation you should learn about

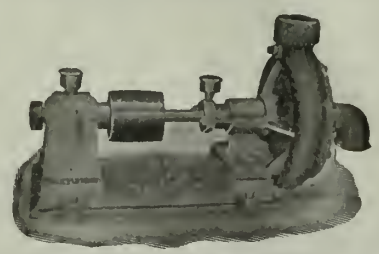
Bean Centrifugal Pumps

For Downright Good Service They are Absolutely in a Class by Themselves

The Bean Automatic Water Balance eliminates end-thrust, thus saving much trouble.

The Bean Water Sealed Stuffing Box makes excessive tightening of the stuffing box glands unnecessary. The shaft where it enters the pump is entirely surrounded by water, which forms a perfectly air-tight seal with very little friction.

Bean Runners are Enclosed, accurately machined and perfectly balanced. This means greatest possible efficiency.



SEND FOR BEAN CATALOG 28-B

It illustrates and describes the Bean line of Horizontal and Vertical Centrifugal Pumps, Bean Turbines, Direct Connected Outfits, etc. Tell us your pumping requirements. Also, single and double Well Casing.

will prevent evaporation; while the cultivator leaves it in ridges exposing too much surface to the drying influence of the wind and sun. Neither will do the best work, however, until the clods have all been mashed and the dirt worked up fine. —Editors.]

IGNORANT OR INDOLENT DRIVERS.

[Written for Pacific Rural Press.]

"Practically all the troubles of automobilists are due to ignorance or indolence," said an automobile mechanic the other day.

"The troubles due to ignorance come because those who run machines are not well acquainted with them. Each machine is different from the other, although many of the principles are about the same. But unless one knows by the sound of its running just what is the matter with his particular machine, he will have troubles due to ignorance. The same discordant sound in one make of a machine will indicate a different trouble than it would in another make. The first thing a man ought to do is to gain a thorough knowledge of the priciples on which his machine is built and the details of the mechanism.

"Troubles due to indolence usually follow the idea that "Oh well, she's running all right, why should I worry?" Before such a driver knows it there will be a few nuts loose, and then there is extra wear on the bolts, extra jar and vibration on the machine, and pretty soon something breaks.

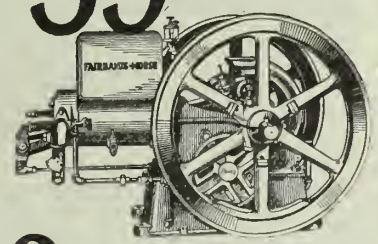
"There is another trouble, too, which comes from not overhauling the machine occasionally. Nuts underneath the works are likely to keep oiled enough so that they do not rust, but those where oil does not naturally work into them are likely to rust tight; and in case of any trouble at all, the mechanic who repairs the machine has to spend an hour or two getting the nuts off, usually with a cold chisel and some profanity, and the automobile owner wonders why he has to pay so much for the job. If every nut on the machine is tightened up, say a quarter or half a turn, about every month it will prevent this rusting and enable repairs to be made in the quickest time at the least expense.

PIPING COLD AIR.

To the Editor: I am building a cold storage house on my ranch. I am building it underground. The floor and wall will be concrete, the ice packed in sawdust. What is the best way to place the pipes to carry the cold air below, and what is the best way to pack the ice to make it last the longest?—S. B. C., Fresno.

[In building your cold storage house, pack your ice cakes close together with no sawdust between them, but with a good packing of sawdust around the outside of the stack of ice. If the ice is stored underground only a little packing around the outside will be necessary; but considerable sawdust, say at least ten inches, should be packed on top of it. The cakes may freeze together a little bit, but are easily cracked apart with a chisel. In cooling off your milk room, probably the most economical way would be to put a cake of ice in a small compartment through which air from outdoors may come down over the ice and downward through a pipe to the floor of the milk room. The warm air of the milk room will rise toward the ceiling as the cold air from the ice flows in and there should be an outlet in the roof just large enough to furnish circulation without allowing much outside air to enter.—Editors.]

TRACTOR PLOWS DRY ADOBE.



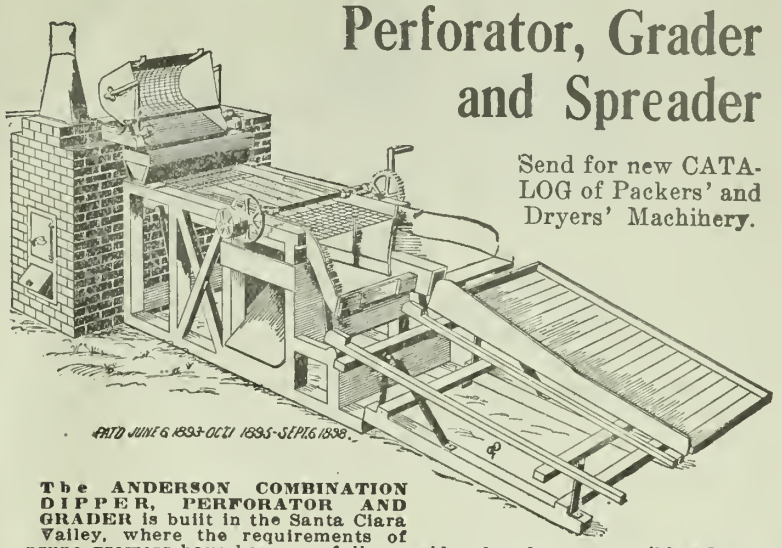
Plowing 240 acres of "adobe the worst kind" before December was made possible for Frank Roberts of Sonoma county with a Yuba 18 h.p. tractor and a Spalding-Robbins disk plow. This was done while many of his neighbors were waiting for rain to soften the soil enough to plow. He plowed 10 acres per day 8 inches deep at a cost for gas and oil of $2.40 per day.

"I am perfectly satisfied—do not think I could do without it."

Where there is wood to saw on the farm, it is a good idea to do as Jos. Wolf of the Santa Clara Valley, who runs a belt from the fly wheel of his irrigating engine to a circular saw which may be run at any time except when irrigation is on.

$59.00 F.O.B. Beloit, Wis.

Complete with battery and accessories—ready to run.



2 HP Gasoline Engine

Strength, weight, durability, workmanship and fuel economy, all guaranteed by *Fairbanks-Morse quality.*

Fairbanks, Morse & Co.

Warehouses in 30 large cities, where delivery can be made and car-lot rate of freight only, added.

Anderson Combination Dipper, Perforator, Grader and Spreader

Send for new CATALOG of Packers' and Dryers' Machinery.

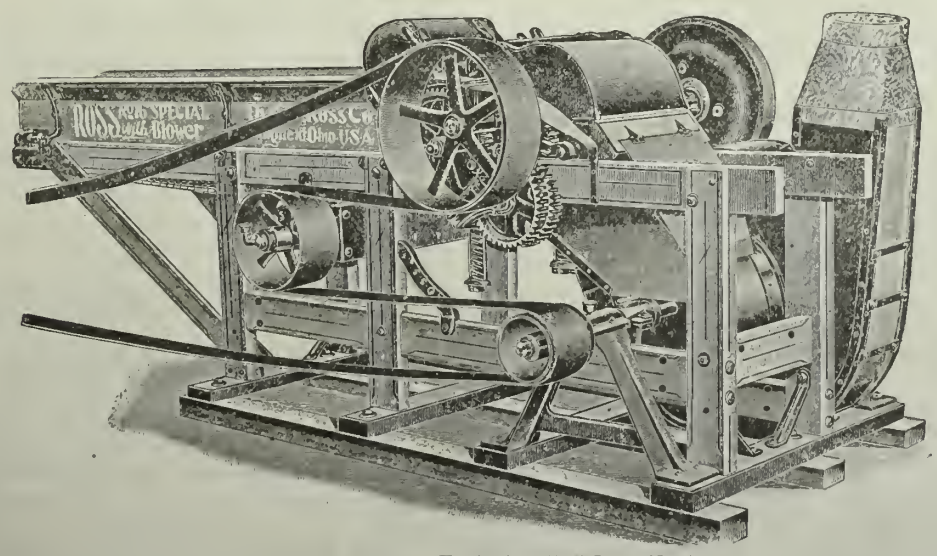
The ANDERSON COMBINATION DIPPER, PERFORATOR AND GRADER is built in the Santa Clara Valley, where the requirements of prune growers have been carefully considered and every possible advantage incorporated into the machine. Can be furnished with or without rinse tank. Made in various sizes for hand or power.

SEND FOR 1915 CATALOG.

It illustrates and describes the entire Anderson-Barngrover line of Fruit Packers and Dryers' Machinery. A copy will be sent free to all who are interested. A postcard will bring it.

See our Exhibit in the Palace of Horticulture at the Panama-Pacific Exposition adjoining the Cuban Gardens, which are under the Big Glass Dome.

Anderson-Barngrover Manufacturing Co., 20 West Julian St., San Jose, Cal.



IRRIGATION SYSTEM

This is the Method of Irrigation in general use throughout the Southwest today. Open ditches, wooden and concrete flumes have been almost universally superseded by the K-T System. You cannot afford to experiment with obsolete or inferior methods. If you are a present or a prospective irrigator, you should have a copy of our valuable booklet on Irrigation. Write for it today, and for any specific information you may require.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Much gray scale is being found in some of the citrus orchards of the Porterville section.

Three cars of orange trees, mostly Washington navels, have been received by Chas. E. Sawyer of Sacramento county for planting on his land there.

Butte county's orange crop will possibly go to 75 per cent of a normal crop, according to an estimate made by County Horticultural Commissioner Earle Mills.

Porterville orange growers recently listened to an address on gray scale, spraying, and fumigation delivered by Prof. Quayle of the Citrus Experiment Station at Riverside.

The regular monthly meeting and picnic of the Covina Farmers' Club was held recently at the Citrus Experiment Station at Riverside, at which time opportunity was given the members to inspect the experimental work of the Station and listen to addresses by members of the faculty.

The Tule River Citrus Association of Tulare county met recently and elected the following officers and directors: H. Webster, president; A. W. Clark, vice-president; and Frank Wilson, secretary and manager. Directors, W. E. Sprott, A. W. Clark, H. Webster, J. G. Larson, and W. W. Lindley.

To attract auto travel through the citrus belt and to advertise the east side of Tulare county was recently discussed at a meeting of the various chambers of commerce of the county. It is proposed to erect large signs, descriptive of the route, directing automobile tourists coming up or down the valley through the citrus belt.

DECIDUOUS FRUITS.

Aphis in the prune orchards of Gridley is causing much concern to the growers.

Dried apples from Sebastopol took grand prize at the Panama-Pacific Exposition.

The sixth annual Gravenstein Apple Show will be held at Sebastopol Aug. 14 to 22.

Two packing houses are to be built in Concord, one by the Pioneer Fruit Company and the other by the Earl Fruit Company.

A shipment of $30,000 worth of canned fruit was made to Liverpool, England, by Libby, McNeil & Libby from their Yuba canneries. This shipment is believed to be one of many going to England.

G. A. Bolster, sales manager of the California Cured Fruit Exchange, and E. E. Ogden, president of the California Cured Fruit Exchange, recently addressed a meeting of the Santa Rosa Cured Fruit Association.

The San Jose Grange was addressed June 26 by Leonard Coates of Morgan Hill. His subject was the development and improvement of fruits of commercial value, with reference particularly to the working over of unprofitable orchards.

It is reported that green fruit packers of the Fresno district, including also Kings and Tulare counties, will handle only peaches bought early in the season on contract, and very few cars of fruit which they usually handle on consignment.

Peaches have been entering central states from southern states in large quantities for the last two weeks. It is estimated that the probable output of the Gulf states east of the Mississippi, including Georgia, Tennessee, and Kentucky, for this season will be 5,000 to 6,000 cars.

A new cut in freight rates has been assured California shippers, according to an announcement made that the Interstate Commerce Commission has authorized the Southern Pacific Railroad and its eastern rail and steamship connections to make a rate of 60 cents and 80 cents per 100 pounds on dried fruit in bags to eastern points in carload lots, having a minimum carload of 60,000 pounds. These rates may be established from San Francisco, Oakland, San Pedro, and Wilmington to Boston, New York, Philadelphia, Baltimore, and Charleston. Higher rates may be maintained to intermediate points, but such intermediate points may not be increased over the present.

GRAPES AND SMALL FRUITS.

Shipments of raisins for the first five months of 1915 exceed the average for the first five months for the last five years.

Inspection of infected vineyards in the vicinity of Yuba City is being carried on by R. L. Nougaret, Government Expert on phylloxera.

That grapes are setting well, with little or no danger feared from mildew and other troubles, is the report received from Livermore Valley.

Approximately 1,000 tons of Muscat raisins were exported from Fresno during the past week, according to the California Associated Raisin Company.

Wylie M. Giffen, president of the California Associated Raisin Company, is in the East making a study of conditions there. He will return to California July 15.

The California Associated Raisin Company received two grand prizes at the Panama-Pacific Exposition, one for the seeding process and the other for the quality of the seeded raisins.

OLIVES AND NUTS.

Blight is hurting Santa Barbara walnut prospects.

N. B. Crane of Oroville recently sold a 12-acre bearing olive grove to Mrs. Lucy V. Day.

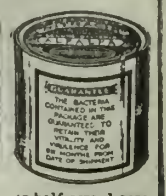
J. P. Murphy purchased 30 acres of two and three year old almonds from C. N. Howard of Chico, for a price in the neighborhood of $10,000.

Olives from the Ehmann Olive Company of Oroville took Grand Prize at the Panama-Pacific Exposition, and the oil exhibited by that company was given an award of honor.

Grafting their oil olives over to the Mission variety is being done by several growers in the Fair Oaks section. It will be three or four years before they will reach a profitable bearing stage, and then not profitable unless the buds were taken from trees bearing large fruits.

At the annual meeting of the Capay Almond Growers' Association, the following directors were elected: F. M. Parker, Harrison Barr, P. H. Wanshop, W. Naismith, and Chas.

INSURE YOUR SEED



Get a "catch", a good stand, and a big yield of ALFALFA, BEANS, Peas, Vetch, and *all other Legumes* — inoculate with

The Improved German Soil Inoculator, Nobbe-Hiltner Process

NITRAGIN

PURE CULTURE

Gold Medal St. Louis 1904

THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

in half-acre, 1-acre and 5-acre cans

Inoculated ALFALFA Not Inoculated

"NITRAGIN" is the *original* Pure Culture—*a granular* medium (*not* a jelly)—nothing to break or spill—packed in a ventilated can, containing millions of surfaces, supporting billions of nitrogen-gathering germs, their health, strength and virility

Guaranteed for Six Months by the Armour Fertilizer Works.

Absolutely harmless. Easy to use. An investment—not an expense. Remember—legumes not inoculated take *no* nitrogen from the air. Inoculated legumes mean bigger yields, richer feeding value, better soil.

Pure Culture inoculation is endorsed by the U. S. Dept. of Agriculture and other authorities. Thousands of satisfied California ranchers testify to the wonderful results obtained with "NITRAGIN" — the *Original* Pure Culture.

Avoid Imitations. LOOK FOR THE ARMOUR OVAL LABEL.

Make your crop sure. Inoculate with "NITRAGIN". It can be obtained for *any* legume.

See your seed dealer or write for FREE BOOKLET.

Armour Fertilizer Works, Dept. 137, 803 Central Bldg., Los Angeles 1019 Front Street, Sacramento

One of the many styles and sizes of Fruit Trucks I manufacture. Sixteen years of experience has taught me how to make trucks that will stand the hard knocks and that will last. I also build road carts. For prices and further particulars, address

230 Union Terminal Building, Jacksonville, Fla.

EUCALYPTUS SEEDS.

Forty species to select from. Write for free pamphlet "Eucalyptus Culture." It tells how to sow the seed, raise the young plants and plant out in the field. Trial packets 15c each. 4 for 50c. Special prices on large quantities.

THEODORE PAYNE,

345 S. MAIN STREET, LOS ANGELES, CAL.

Herman. The directors then organized and elected W. Naismith president, C. C. Barr secretary, and P. H. Wanshop delegate to the California Almond Growers' Exchange.

On account of their increased membership and in order to handle the expected 700 tons of nuts this year, the Almond Growers' Association of Lodi will enlarge their plant and install new machinery.

The International Press Congress to consider how to make farm papers and other periodicals better, will meet in Festival Hall at the Panama-Pacific Exposition July 5 to 10. All sessions are open to any person interested.

The Guinda Almond Growers' Association, an independent association of almond growers, at a recent meeting voted to join the California Almond Growers' Exchange, making 18 associations now composing the Exchange. The Guinda Association owns a modern, fireproof almond warehouse and represents about 140 tons of the famous Capay Valley almonds, 1915 crop.

GRAIN AND FIELD CROPS.

A fine stand of beans and sugar beets is reported in Santa Barbara county.

The second crop of alfalfa is being cut in the vicinity of Woodville, Tulare county.

The Manteca Cannery will open after July 4, beans being the first crop handled.

The Visalia plant of the San Joaquin Valley Sugar Company will open early in July.

Three carloads of alfalfa hay daily to Australia through San Francisco is being shipped by Robert A. Foster of Corning.

The Porterville Alfalfa Company has closed a contract with W. H. Bloomingdale of New York for a shipment of alfalfa.

Forty acres to asparagus will constitute an experimental planting to be made by the Mills Orchard Company at Willows in the near future.

The Lima Bean Growers' Association of Ventura county has suspended business for one year because the required 50,000 acres was not subscribed.

It is stated that the asparagus business in Yuba county has trebled in the past year, the income to growers increasing from about $10,000 a year to nearly $25,000.

Three thousand acres of alfalfa fields and orchards are under irrigation in San Benito county from the canal system of the San Benito County Land and Water Company.

The U. S. food inspectors have ruled that the so-called Manchurian, Korean, and Japanese Limas are merely varieties of the common bean and much inferior for table use. It will be illegal hereafter to market them as Limas.

M. D. Vieira of Turlock writes that they are cutting a fine third crop of alfalfa now in that irrigation district. Grain crops have been harvested and land being prepared for beans and Egyptian corn. Melons and sweet potatoes are less noticeable than last year.

MISCELLANEOUS.

The Northern California Exposition, Agricultural, Livestock, Poultry, and Mineral Show, embracing Trinity, Siskiyou, Modoc, Lassen, and Shasta counties, is to be held at Redding early in September.

A model farm is to be started by the Kern county high school, with the idea of making it one of the show places of the county. It consists of 27 acres of fine land. Geo. Berry, graduate of the University of California, has been appointed instructor.

Parcels post shipment to Italy, which was suspended on May 24, has been resumed. Regardles of the existence of war, the United States may send parcels post packages to all the countries of the world except Belgium, Turkey, and the northern and northeastern parts of France.

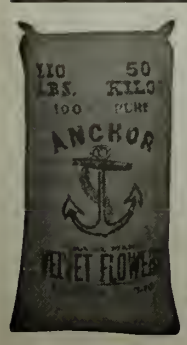
Protests are being prepared by various irrigation districts in California to be sent to Washington against granting any more reservoir rights to power companies unless conditional on turning the water back into the stream without cost to the districts, or on equitable basis.

Lack of ships to carry California fruit, grain, and other products to foreign countries is responsible for the almost prohibitive rate on trans-Atlantic freight. Lack of ships is responsible very largely for low prices of farm products now. With this in view, as well as other purposes, the San Francisco Chamber of Commerce has adopted resolutions addressed to the President, to the Secretary of Commerce, and to the Chambers of Commerce of all other American cities, urging their help in securing the appointment of a commission of practical shipping men to study the shipping laws of foreign countries and devise laws which would be fair to all parties and yet increase the number of ships sailing under the American flag and thus unavailable for war purposes of foreign nations just when we need them most to carry our farm products across the sea.

Spraying Time

and there is no better spray than

Scalefoe



Not only for scale but nearly all insects, worms and bugs that infest plant life. It has been killing them for 15 years, giving the greatest satisfaction without injury, but positive benefit, to the plant. Send for our book of testimonials or better, try it.

Gallon can, 50c;
5-gal. can, freight prepaid, $2.00.

Must be mixed 20 parts water to one Scalefoe before using, making it very cheap. Write for prices in barrels delivered at your freight station.

MORE STOCK FOR FOOD AND FERTILIZATION.

THE PACIFIC RURAL PRESS occupies a rather unique field among agricultural papers of the country, in that it has been in existence and been a factor in all the agricultural development of note in California, and that is saying a great deal. The paper has, however, devoted a large part of its space and influence toward the upbuilding and encouragement of the fruit industry.

To every man familiar with the agriculture of the State, it must be evident that we have reached a point where the furtherance of branches of agriculture other than the fruit growing must be considered of primary importance. We are becoming a bit wobbly; we need to quiet down and direct our attention to some definite lines of development. No one is in better position, or is better qualified to direct this movement than you are. ("Who's Who" tells us that your esteemed editor once made a study of cheese, was Secretary of a Dairymen's Association, President of a Dairymen's Board of Trade. We know that he has long been with the "Cow College" over in Berkeley and has ably directed its work.)

Here's what we have to suggest: California needs more dairy cows, more beef cattle, more sheep, more hogs, more animals of all kinds on the farm, and on the ranges. California farmers should grow bigger and better crops of feed for these animals. Not only are more acres of alfalfa, corn, and grain needed, but heavier yields per acre. Not 5% of the land in the State produces half the weight of crop we have reason to expect.

We need to have cattle and fertilization preached to us. Fortunately the two go together; in fact, supplement each other.

Don't let up on the fruit pages, but help us grow the meat we need. Help us get the kind of laws which will make it possible for the banker to loan money on four-legged stock on grass, as readily as he would on four-edged stock on paper, as is done in other stock-raising States. Help us to stop wobbling; one year we have worlds of cattle and no feed, the next year we have worlds of feed and no cattle. Help us to increase our yields of alfalfa. In the San Joaquin Valley alfalfa doesn't yield as much hay per acre in six cuttings as it does in Nevada in three cuttings. There is a reason for this, and we want to get that reason well understood.

We know Professor Wickson will have a lot of fun helping to start the new industries on the road up. So consider this matter, if you please. Ask a few orange growers, ask a few owners of peach orchards if it wouldn't pay to build up animal husbandry.

Yours very truly,

San Francisco. SYMMES AND MEANS.

Being Safe Rather Than Sorry With Hogs.

[Written for Pacific Rural Press.]

Build your frame first and then pile on the fat with plenteous feeding afterward, is the principle W. T. Chapple, manager of the Fair Oaks Ranch at Willits, puts into practice with hogs, and he is so successful at it that the local butchers greedily absorb his product at top prices always. The last bunch of 50 head turned off weighed 150 pounds at five months old.

Had this been written three years ago, it would be a different story. Then the grade sows on the place were small boned and scrubby. Also the ranch had been farmed to grain hay so long that poor crops were the rule, and lastly, Mr. Chapple was a city man with no farming experience.

The first jobs were to get bone into the young pigs and then decide on a ration that was economical and productive of quick growth.

Two registered Duroc Jersey sows and a Duroc boar were purchased as a foundation for a purebred herd. The boar was used as herd sire for the grade sows as well as the purebred and thus a part of the bone was bred into the pigs.

Breeding alone don't make the frame, though. It takes bone building feed and Mr. Chapple thinks that too many farmers lose sight of this point.

As soon as the pigs are born, their little sharp teeth are snipped off with a pair of tweezers. The sows with their pigs are housed in a central farrowing house. The ration fed to sows and young pigs is composed of ground barley or wheat, shorts, and tankage fed in a thin slop.

Tankage is used as a substitute for skim milk and has been used very successfully in connection with ground barley, wheat, sulphur, charcoal, linseed oil meal, air-slacked lime, and copperas, which is continuously kept before them in self feeders. This with rape and barley pasture has been the main spring and summer rations, a 70-acre field of oaks furnishing a large quantity of acorns some years in the fall after frost upon which the hogs gain in flesh rapidly. Acorns make a poor quality of pork unless the hogs are later hardened on grains, and this has led to grain finishing in all cases.

Keeping the above mentioned feeds in front of them all of the time naturally leads to rapid growth and to some may seem a pretty expensive table to set for animals that are noted for their ravish appetite for good feeds, but it is Mr. Chapple's experience that it takes about so much feed to proluce a given amount of pork and it's better to turn off the weight in six or seven months than it is to wait for a year and a half as is customary in that section.

In feeding grain, however, care is exercised to prevent the hogs from gulping rather than chewing their feed, by self-feeders which do not permit of rapid eating. It is surprising to note that while each bin is kept full, the amount eaten of the different feeds does not vary greatly, the hogs evidently liking a variety best. Once when the supply of tankage was exhausted for a time, however, it took several days to fill them up on it again, their systems apparently demanding about a certain amount of it before they again settled down to the ordinary amounts.

Feed growing on the ranch has been limited pretty much to barley and wheat, with some vetch and barley pasture. Experiments are being tried out this year with artichokes and clover, and at present appear to be suitable crops for that district. If they prove so, a larger acreage will be put in next year.

To quote Mr. Chapple, "We have gone into this game easy, preferring to be sure rather than sorry. We feel now that we are ready to go into the purebred business, the thing we originally started to do, and from now on we shall materially increase our Duroc herd, selling off the grade sows and filling in with purebred gilts. We also contemplate breeding Berkshires, having purchased two choice gilts last fall."

That their logic has been sound is demonstrated by some of the largest and most uniform pigs that it has been the writer's privilege to view for some time, which were seen on the ranch in June.

CALIFORNIA'S JERSEY ISLE.

(Continued from page 1.)

tremely heavy, and the fogs supplying additional moisture in the summer months.

Root Crops Supplement Pastures.—Beets and carrots are the chief crops used to supplement the pastures, carrots being fed in connection with pasture from about September 1 till November or December. At that time the heavy rains commence and the cattle are fed beets and hay in the barn till the beginning of spring, when they are turned on to the pastures again. It is at this time of the year that the cows freshen, the common practice being to dry them up during January and February.

The soil is productive of wonderful tonnages of everything grown, although as one man explained, "We can only guess at the yield of forage as most of it is pastured." As an example of its richness, however, we were repeatedly told of instances where a cow to the acre was being carried, the average for the section being 1½ acres to the cow. One piece of fall-sown pasture was seen that has already been cut for hay twice this year and will produce another cutting before winter. Two dairymen estimated the carrot yield per acre at 90 tons, the cost of raising of which runs between $40 and $50. It is an established belief among many of the dairymen that the more farming you do, the less money you make, and that the man who pastures most, makes the most money.

Silage to Help Root Crops.—There has been in times past one season of the year when the feed problem was a trying one. That was an interval of about six weeks after the pastures begin to dry up and before the carrots begin to ripen. It is proposed to fill the gap in the future with silage, using the early cuttings of clover and rye grass for this purpose and thus overcoming much rain-damaged hay in the spring. Vetches and oats and vetch and bald barley are also thought well of as a silo crop, being planted on the carrot land in the fall and siloed before carrot planting season in the spring.

Corn is grown to a limited extent, but the ears do not fill out sufficiently to make silage, so it is used as a soilage crop. Some alfalfa is being tried out, but the water table does not permit its deep rooting, it is thought. That its value is recognized, however, is proved by the outside purchases of baled hay which are being made each year at prices of $12 to $15 a ton.

"I have made one big mistake and it was also the mistake of others," said one man. "When I started to use purebred bulls almost 30 years ago, I should have purchased some registered cows. My herd would now be so valuable to others that I would find a ready market for my young bulls and heifers. My average production as well as that of my neighbors is high, and our herds are purebreds for all practical purposes, but we can never register them and, therefore, cannot sell them for breeding purposes. This should and would be known as the Jersey Isle of America had we started breeding purebreds years ago. With the tenants gradually purchasing the land, and the purebred animals rapidly increasing, we are expecting more rapid advancement in the next few years than we have made in the past," which factor if carried out will always keep Humboldt county in the fore ranks of prosperous agricultural counties of California.

Bargains, First-Class Show Bulls

We are offering for sale purebred registered HOLSTEIN FRIESIAN BULLS. Serviceable age. Bred in the lines of Pontiac, Korndyke, De Kol, Hengerveld, Inka and Spofford blood, the highest record strains. Dams—high record foundation cows, ranging up to 38 lbs. in 7 days. For further particulars and prices write or call:

H. L. MURPHY, PERKINS, CALIF.

Mules for Hot Weather.

[By Forest H. Berg, San Francisco Veterinary College.]

There are two kinds of mule, the mule proper (Equus Asinus), which is the produce of a male ass with a mare, and the "hinny" resulting from the mating of the stallion with the female ass.

The mule is the more valuable of the two, and to its production the attention of breeders is entirely directed. In fact the production of the hinny is so rare that its existence is sometimes denied. However, we know it does exist, but we shall not pause to consider it, as it is seldom seen and has no commercial importance.

Horses and asses will not associate with each other, and intercourse between the two species is seldom voluntary, for, although the male ass will mate with the mare, the latter seems to have a strong aversion to him, as is also true of the stallion regarding the female ass. For this reason, in mule breeding, it is often necessary to blindfold the mare before she will allow the ass to be brought near her.

It is claimed that fecundation is not so certain between the ass and horse species as between the male and female of either species. Fecundation of the female mule by the stallion or male ass is not very rare, although she seldom reaches the natural term of pregnancy and rarely brings forth a living offspring.

No instance has ever been recorded in which the male hybrid has been prolific, although physically he appears to be perfect and often displays an intense passion for the female.

President George Flemming of the Royal Veterinary College of London says that the period of gestation in a mare impregnated by the ass is a little longer than when the father is a stallion, the average time being 375 days, also that abortion occurs more readily and more care is necessary than in breeding horses and asses.

In mule breeding more choice can be given to the selection of mother than the father, for almost all asses have in proportion to their weight, a very large head, short thick neck, flat sides, low shoulders, narrow chest and croup, small legs and very narrow hoofs.

The selection of mares with a small head, round body, short back, a long neck and wide round hoofs will aid greatly in remedying the defects of the sire, for although mules inherit to a great extent the shape and peculiarities of the sire, they derive their size from the mare, seldom showing her bad shape or unsoundness.

The mule foal is not so strong on its limbs as the horse foal; it does not grow as quickly and should not be set at heavy task work until fully matured or much permanent injury may result. It is longer reaching maturity and of little use under four years of age, but it is useful for a longer period than the horse, often working until it is twenty or even thirty years of age.

It possesses the sobriety, patience, endurance and surefootedness of the ass and the vigor, strength and courage of the horse. As a beast of burden it is preferable to the horse as it is less impatient under heavy draught or weights, while the skin, being harder and less sensitive, renders it more capable of resisting sun and rain.

The mule is very frugally and economically fed, and, although it is true that he will accept food rejected by his half brother, the horse, it pays to deal generously with him. He is equally good for carrying as for drawing loads; he walks well and steadily, easily traverses the worst roads or paths and picks his steps by the side of a precipice with the surety and safety of a goat.

For hot and dry countries, especially those that are mountainous, he is well adapted. Among the Greeks he had a name which meant a mountaineer.

The mule, like the ass, enjoys an extraordinary immunity from disease. After the campaign in Egypt in 1882, the English horses suffered more extensively and severely from a kind of malarious fever, but the mules were entirely exempt.

A similar exemption has been noticed during the prevalence of epizootic maladies at other times; nevertheless, those diseases which attack the mule run their courses with great rapidity, for example glanders, which often appears in the chronic form in the horse, is most acute in the mule and ass.

In the choice of breeds we have considerable room for selection. The use which we wish to make of it would doubtless influence our choice of parents. If size and strength are the important qualities sought, the Poiton Jack would probably fill the requirement. Poiton is a district of France. Then, there are several fine breeds from Spain to which the breeders of California are quite partial. To most American breeders the American Jack is the "Summum Bonum" (chief good) of all mulish excellence. He is a combination of all the various imported excellencies, and is claimed to have larger feet and larger and stronger legs than any one of the imported breeds. Should you happen to desire a small mule, for mountain climbing, the Maltese Jack would meet the demand.

Some California breeders have used mothers selected from broken down city stock, which might or might not make good mule mothers. To obtain the most desirable results one should exercise great care in the selection of the maternal ancestor.

The mule is not useful in very cold, wet, or muddy countries; California gives him an ideal home, with its hot, dry climate.

A certified dairy is to be established by U. Hartmann on his 150-acre ranch near Ripon.

You need a new

DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or setting process of creaming—

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer when the milk supply is heaviest.

BECAUSE TIME IS OF GREATest value on the farm at this season and the time and labor saving of the good separator, counts for most.

BECAUSE THE SKIM-MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF AN improved De Laval Cream Separtor is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind—

BECAUSE THE LOSSES OF the poor separator from incomplete skimming and the tainted product of the hard-to-clean and insanitary separator are greatest at this season. counts

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE AN IMPROVED DE Laval is so much simpler and more easily handled and cared for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk-pile long ago.

BECAUSE THE DE LAVAL SEParator of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. DAIRYING.

Sixteen grade Holsteins were purchased recently by J. E. Burney of Waukena from R. C. Sturgeon of Tulare.

A daughter of the champion milk producer, Pearl of Venedera, owned by Guy H. Miller of Modesto, has been purchased by H. V. Traynham of Williams.

A public sale of Jerseys, the property of Roy Sage, was held in Gardena, Cal., on June 18. It was a fair success, the offerings being small and only in fair condition.

The California Central Creameries Company's dried milk plant at Ferndale burned down last week and the company will not be able to manufacture any more dried milk this season.

A shipment of 420,000 pounds of butter left San Francisco on the liner Moana for Australia on June 23. This brings the season's shipments to nearly a million and three-quarters pounds.

Butter from the Central California Creameries, under the name "Golden State Butter," was given the highest awards at the Panama-Pacific Exposition in competition with the rest of the world.

McAlister & Son of Chino state that they intend to hold a consignment sale of Holstein cattle in conjunction with A. W. Morris & Sons of Woodland at Sacramento the first week in November. About 150 head will be sold, of which McAlister & Son will consign about 80.

The Allison Ranch of Turlock write us: "We have just shipped in from San Diego county two carloads of choice dairy cows. It takes a little time for them to overcome now rested and will soon be in good such a trip and change, but they are shape."

To the Editor: We have just completed our second sale of a herd bull to the Whittier State Reform School. Mr. Taylor of the Whittier State School selected this bull after carefully examining a large number of bulls not only in California, but from many of the best herds in the East. He is sired by a son of King Segis Pontiac, who is the sire of the $50.-000 bull, King Segis Pontiac Alcartra, and the $20,000 bull calf, King Segis Pontiac Chicago. His dam, De Kol of Valley Mead, has a record of 25.005 pounds butter and 584.2 pounds milk in seven days. One of her daughters, De Kol of Valley Mead 2d, has recently made over 1,000 pounds of butter in a year, and she holds the world's record for an average of a three-year and four-year-old yearly records.

Chino. McAlister & Son.

HORSES AND SWINE.

The Allison Ranch of Turlock report the sale of Berkshire boars in June to F. H. Sharpe, Dixon, and C. S. Coke of Newman.

An order has been received in Eureka, reported to be from the French Government, for 1000 horses; and agents are scouring the ranches for stock to fill it.

T. H. Gilroy of the Guyton & Harrington Mule Company of Kansas City is in Sacramento looking over the local stock market in the interests of his company.

Agents for the English Government are reported to be in the northern California section buying all available horses for cavalry use.

A peculiar disease affecting the throats and jaws of the animals has developed in the horses in some sections of Tehama Co. The disease has the appearance of foxtail jaw, but is more severe. So far, no deaths have resulted from it, however.

Notwithstanding the fact that the 1915 pig crop is perhaps the largest ever produced in this country and health conditions are perfect, packers of the East are apparently not as anxious for the severe break in hog values in June as usual. It is now thought that, although the June run will be liberal, it will not go down to $7.00 per cwt.

The influence of the war demand for horses is being felt in the East, as is shown by the increased receipts at the Chicago market this year over last. There are now two British and two French representatives regularly installed in that market. The standard price for horses accepted is $135 to $150 for riders and $145 to $200 for gunners. Orders for horses from commercial sources are said to have been about all filled.

A report from Los Angeles is to the effect that the British government has commissioned John W. Snowden to purchase every available horse and mule in southern California that complies with requirements for shipment to England for military purposes. It is evident that before the war is ended, California will have been fairly well cleaned up of the military type of horses with which we have been over-supplied for sometime.

CATTLE AND SHEEP.

Two hundred sheep belonging to G. N. Merritt of Woodland recently succumbed to an unknown disease.

Twelve cars of cattle were recently shipped from Oakdale, the bulk going to the Western Meat Company.

It is reported that Miller and Lux have recently purchased 10,000 Ari-

FOR SALE

Pure Bred and Registered Polled Angus

Bulls

from the most fashionable families including Queen mothers, Heroines, Blackbirds, Prince Ito's, Ericas and Prides. I purchase individuals nearly every year at the International at Chicago. I can refer by permission to Prof. Gordon H. True of the University of California.

A. W. LONGLEY,

Bishop, Inyo Co., Calif.

zona yearlings to ship to their California ranches.

Three hundred and forty head of cattle were recently shipped by Robinson Bros. of Merced from their Portland, Ore., range.

Lambs from California, Idaho, and Arizona have put in an appearance in eastern markets recently, Arizona lambs selling at Kansas City on the $10 basis.

A report from the East states that but for Iowa's weekly contribution, the Chicago markets would be practically bare; and that fat cattle are not plentiful at any of the Missouri river markets.

A carload of purebred Hereford stock was recently received by dairymen of the Poplar district in Tulare county from a stock farm in Sacramento. These will be used to improve the stock of that section.

It is reported that both cattle and sheep are doing well on the Arizona ranges and bringing good prices. Late rain put the range in excellent condition. There was a full 90 per cent lamb crop and the animals sold higher than ever before and met a good demand.

The campaign to destroy cattle tick in California, begun in 1907, will be completed during the present year, according to an announcement made by the U. S. Dept. Agr., only a section of San Diego county being infested with the tick at this time. A total of 73,197 square miles has been disinfected at a cost of $126,832 to the Federal Government, $23,523 to the State, and $35,983 to the California counties.

Word just received from the East is to the effect that the Paicines Ranch Company of San Benito county have just purchased from D. R. Hanna of Ravenna, Ohio, the imported Shorthorn bull, Champion of Scotland. Mr. Hanna paid over $3,000 for this bull in Scotland; and according to Frank W. Harding, secretary of the American Shorthorn Breeders' Association, the bull is held in high estimation by the best breeders in North Britain.

MISCELLANEOUS.

A shipment of 6,000 head of cattle from Honduras, Central America, the first in history, is on its way to the East St. Louis, Ill., stockyards.

Two hundred head of cattle were recently shipped from the San Juan and Carissa Cattle Company's ranches of Kern county to the San Francisco markets.

Receipts at the Portland Union Stock Yards for the week ending June 24 were: Cattle, 1136; Hogs, 3686; and Sheep, 3082. Cows are quoted at $5.75 to 6.25. With a good run of hogs, the market opened at $7.85 for top stuff, going down 10 cents toward the end of the week. Sheep receipts were light with good quality stuff. Choice lambs are quoted at $7.14; ewes at $4.75; and wethers at $5.50.

Oleomargarine tax frauds are estimated to have amounted to $27,000,000 during the 13 years the present law has been in force. Since 1902 over 200,000,000 pounds of colored oleo are said to have been sold as uncolored oleo or butter. The tax on the colored article is 10 cents per pound, but only ¼ cent on uncolored. Fines aggregating $148,000 have been imposed, $851,000 of the tax fraudulently withheld has been recovered, 29 violators have been sentenced to prison and 10 others await trial.

EXPOSITION MILK SHOW.

Nearly 2500 bottles of milk and cream were shipped from 25 states and various portions of Canada to the International Milk and Cream Show at the Panama-Pacific Exposition June 14 to 19. Practically every large city was represented either by individuals or firms. Prof. L. M. Davis of the University Farm at Davis, Cal., superintended the show and assisted with the judging and the various tests. The chemical and bacterialogical examinations were each made by experiments in the laboratory of the University of California. The California winners were: Harold Okell, Florence, second prize in Market Milk Producers' Class; Kell's Dairy, Stockton, first in Market Cream Producers' Class; Kell's Dairy, Stockton, second in Pasteurized Cream Class; Hutton Bros., Dixon, third in Certified Milk Class; Agricultural Experiment Station, Berkeley, first in College and Experimental Station Milk Class; Agricultural Experiment Station, Berkeley, third in College and Experimental Station Cream Class.

Ames-Irvin Company

8th and Irwin Sts.,
San Francisco, Calif.

The Standard Test for Rubber Belt

Ask your dealer to cut off two strips of belt one inch wide, one from Test Special and one from any other brand. Separate the plies with a knife as shown in Photo 1. Then endeavor to pull the plies apart as shown in Photo Number 2. If your dealer does not carry **Test Special,** secure a sample of what he has and send to us for Test Special sample.

Another Test for Rubber Belt

This time test the belt for flexibility. The grade of cotton duck used in a rubber belt is an important factor. For Power transmission the duck must be flexible, not hard or stiff.

Take the ends of two rolls of belt, one of them **TEST SPECIAL,** in your hands. Bend them back and forth. You can feel the difference.

TEST SPECIAL contains the best grade of cotton duck. The rubber which cements the plies together is pressed into every thread and fibre of the duck.

If your dealer does not carry **TEST SPECIAL,** advise us. We will tell you where to find the nearest stock

WE WILL SOLVE YOUR PROBLEM.

Veterinary Queries and Replies.

[Answered by Dr. H. H. Wintringham, Petaluma, Cal.]

FISH OIL SPRAY FOR FLIES.

To the Editor: Will you kindly give me a better mixture for spraying cows and horses than the one printed in the Pacific Rural Press June 19. —F. S., Live Oak.

[Fish oil is the basis of most fly repellants and may be used by itself. All sprays for this purpose evaporate quickly and have to be repeated as needed.]

PIGS SHAKE.

To the Editor: I have some young pigs that cannot stand still. They shake like a pig does when he is cold. Kindly inform me what is wrong with them and is there any cure.—Z. W. Q., Porterville.

[Your pigs have the thumps. Cut their ration in half. Give each 2 oz. epsom salts, then 2 drachms aromatic spirits ammonia every two hours until relieved.]

RED SPOTS; THEN SORES.

To the Editor: One of my cows has small sores on her teats and bag, which look as though the skin had been knocked off. It dries and forms a light scab. Before it becomes a sore, there appears a red spot under the skin. I have examined them as well as I can and do not find any pus under the scab before it peels off the first time. Otherwise, I would think it cow-pox. Tell me what the trouble is, and a remedy so that it will not break out again. The teats do not seem to cause the cow any pain or soreness when milking her. —J. H., Hammonton.

[Your cow has cow-pox. Get some carbolated vaseline and apply to the eruptions as needed.]

HORSE COUGHS IN MORNING.

To the Editor: Please tell me the quickest way to get rid of a horse's cough.

I bought a horse two months ago and soon found out that he was bothered with what I supposed to be an old cold. He coughs only between 3 and 5 o'clock A. M.; eats well and works the same. His nose runs very little and seldom extricates one or two pieces of matter.

I give him night and morning hot bran and barley. Seems to improve, but the cough doesn't diminish. He is eleven years old.—P. D. G., Campbell.

[Give your horse ½ oz. doses Fowler's Solution three times a day.]

ONE TEAT DRY.

To the Editor: Please tell me what is the matter with my cow. This is her first calf and she only gives milk from three teats. The teat is perfect in size and shape, but I have milked it, also let the calf suck at it but can get only about a tablespoonful of milk from it. At first I thought the milk would come in it later by milking it or letting the calf suck it. This is the seventh day and still there is no milk. All the udder seems to be perfect in every way except that one teat. The swelling is all gone. Please tell me if possible what is the cause and a remedy. At first I also thought there were no holes in the teat, but there are and it milks perfectly easy.—G. M. D., Uno.

[Call in a competent veterinarian, as an operation is probably necessary.]

FLEAS OBJECT TO SHEEP.

To the Editor: Can you recommend anything to be done to get the great numbers of fleas which infest the barn and corrals? We have hogs, and understand that fleas usually appear where they are, and would like to know if the usual dipping for lice will control the fleas; also if there is anything that can be used about the house to drive out the fleas brought in on the clothing.—E. B., Linden.

[Get a small band of sheep, say about 20, and keep them confined to your hog corals and quarters. In a period of about one month you will note a decided decrease in the flea population which eventually will be almost decimated. The writer had a similar experience and knows whereof he speaks. Use powdered naphthalene and sulphur equal parts to sprinkle about the house and beds.]

DRY COWS BEFORE CALVING.

To the Editor: I have a young Jersey cow about which I would like to ask a few questions. She is due about August 9 to have her second calf. Is it proper to milk her up to the term she calves, or dry her up about three weeks before her time? She is very nervous at times when milking, continually stepping, especially when milking the left front and right front teats. She hardly moves when milking the other two. She eats and drinks very well and is full of life. What can I do to prevent her? Her bag is not caked; in fact, she is perfectly sound in every respect.—J. E. B.

[Dry your cow up two or three weeks before she calves. Her nervousness is due to her condition.]

COW HAS BLOODY DISCHARGE.

To the Editor: My cow, second calf last February, has been taken to the bull upon three different occasions, but has not conceived. Last week, during my absence from the ranch, she came in heat again and was taken to the bull. The calf born last February was a large one and for days after she had cleaned, she would pass a small quantity of bloody matter once and awhile. These discharges stopped after a while, and I noticed that after she had been in heat this last time, that she passed some more of this same bloody substance but only enough to smear her tail. She appears to be O. K. otherwise.

Have a horse between four and five years old, weighs between 1300 and 1400 lbs. For the past week or so he has been stopping while in harness, to urinate. Of course, this is not unusual, but as he stops on an average of three or four times during the morning and the same number of times in the afternoon, something must be wrong. He will stop, get into position to urinate and pass very little water compared to the quantity generally passed by horses. I have noticed the same actions when he is out of harness. His appetite is good and he drinks about as usual.—R. H. M., Orangehurst.

[Douche the vagina once a day one week with a 2 per cent solution Cresol, using one gallon of this and placing it well within the cavity with a hose. After one week use for the douche one gallon of water in which is dissolved ¼ lb. soda bicarbonate. Use this for another week. Give your horse one ounce of powdered potassium nitrate in his feed twice a day for one week.]

There is a Big Difference in Silage

THE SUCCULENCE AND PALATABILITY OF perfect ensilage produces maximum results at a low feeding cost.

NO OTHER FEED contains as much "succulence value" as well preserved ensilage.

IT IS THE MOST ECONOMICAL FEED for summer as well as for fall and winter.

BUT THERE IS AS BIG A DIFFERENCE in silage as there is in silos.

AN ABSOLUTELY AIR AND WATER TIGHT silo is needed to produce good silage.

TO MEET THESE REQUIREMENTS, a silo must be of such design, material and workmanship that it will be for many years just as serviceable as when first erected without its being necessary to rebuild every year.

THE IDEAL GREEN FEED SILO will keep ensilage as fresh and succulent all the year as the day the corn was cut.

ERECT AN IDEAL GREEN FEED SILO and stop silo troubles forever. Built of California Redwood, it will last a generation.

Cauliflower $325 Per Acre.

[Written for Pacific Rural Press.]

"This valley beats anywhere for cauliflower and head lettuce. Cauliflower especially needs cool, moist weather and workable soil. It doesn't head well during hot, dry weather, but runs to seed too soon." The Arroyo Grande valley, in which R. M. Plympton lives, is about ten miles long and perhaps 1½ miles wide on an average and is open at the lower end, to the ocean, so that there is a great deal of morning fog and comparatively cool weather during the summer and fall months. The soil is what has been washed down from the foothills and varies up to twenty feet deep, of heavy and light loams and gravelly soils. Mr. Plympton's is a light soil.

Two crops every year on the same land make cauliflower an especially paying proposition. Potatoes are planted in February unless it rains all through February, as it did this year. No fertilizer is applied before the potatoes, but after they are dug in June ten or fifteen tons per acre of manure are added, working over the whole vegetable garden as often as possible at that rate.

Western Seed Preferred.—About all the cauliflower that Mr. Plympton can attend to is grown on two acres. The seed is drilled in large open beds by hand with a Planet Junior drill about July 1. Sometimes another planting is made two or three weeks later to extend the season. Both early and late varieties are used so that heads may be marketed from November to February, all through the rainy season. For the early variety, Mr. Plympton prefers the Early Snowball, but the late variety, California Mammoth, the seed of which is obtained from Los Angeles dealers, makes large late heads of fine quality. Seed obtained from the East was used once or twice, but results were "sorry." Plants from poor seed do not head, but go to seed too soon. The California Mammoth makes exceptionally large, compact, solid heads, an example of which may be seen at the Panama-Pacific Exposition as exhibited by J. E. Parrish, a neighbor of Mr. Plympton. One of the latter's own cauliflowers was taken early in March to the Arroyo Grande Record office . It measured 12 inches in diameter, 42 inches in circumference, and weighed 13½ pounds.

Transplant in August.—All the early potatoes are dug by the end of July, and manure which doesn't contain two much straw is applied as mentioned. Furrows about two feet apart are then plowed for the irrigation, and the ground is allowed to dry five or six days until it can be well worked. Drying here is slow on account of the morning fogs. As soon as the ground is ready, it is plowed twelve inches deep and harrowed. When the plants are about three inches tall, which is at the age of four to six weeks, the large ones are pulled and transplanted. This work usually continues all through August. All of the leaves of each plant are broken off except those which form the heart. If these are broken, the plant is thrown away.

When the cauliflower is set on the level, it is watered by hand, as planted. A garden trowel is used and the dirt is not pressed around the plant. Water is poured on, and when this has settled away, dirt is filled in, being careful not to cover the heart. If the watering is to be done by irrigation, small furrows are plowed with a cultivator and the plants set in the sides of the furrows about half way up. Water is run through the furrow very slowly to settle the dirt, and after about ten days when it has dried out enough in the ditch, a tooth harrow stirs the ground.

No shade is needed, on account of the fog. Very few of them wilt anyway, and it would be too big a job. The early varieties are set eighteen inches apart in rows two and a half feet apart, while the late varieties are set six inches farther between plants. After the harrowing, the weeds are hoed out between the plants, and the patch lies two or three weeks depending on how foggy or dry the weather is. Then a small furrow is run down the center between the rows and the irrigation is followed by cultivation every three weeks. A shovel cultivator stirs the ground deeper as the plants grow larger. When the leaves are so large that they become injured, furrows are left and no more cultivation follows; but the cauliflower is irrigated every three weeks or oftener if the weather is dry and hot. Care must be used, as too much irrigation turns the leaves yellow. November rains make further irrigation unnecessary.

Cut When Begins to Separate.—It took a long time to learn to cut the cauliflower at the right stage. Sometimes it looks all right when still immature. In such cases, a delay of three or four days greatly increases the weight and price without hurting the quality. When such heads are found in the regular semi-weekly picking, the leaves are broken over them so they will not sunburn, or get dirty, or turn yellow, and so the rain will be kept off. Too much rain is likely to hurt the heads. The cauliflower is ready to cut when the sections of a head spread out just enough to show very slightly the lines of separation between them. Plenty of big leaves are left around each head until they are trimmed at the house. If the cauliflower is to go a long distance, more leaves are left on to protect the heads from dirt and injury. All the trimmings are fed to the chickens.

No Grading.—Vegetable crates 20x22x24 inches are packed with about three dozen heads per crate, weighing 110 to 125 pounds. Two years ago, the heads were graded into three sizes. The small size went about three and a half dozen per crate and sold at fifty cents per dozen wholesale; the largest size packed two dozen per crate and sold at $1.00 per dozen; the intermediate size was 75c. There were not so many of the largest size, but some of the dealers objected to the $1.00 price. Anyway, packing all one size takes too much room. They pack better with little heads between, and this was practiced the past winter by Mr. Plympton. It makes a heavier crate, but the price was 60c per dozen. This gives about $325 per acre.

Whenever any cauliflower is ready for market, Mr. Plympton drops a card or telephones to his regular wholesale customers in Lompoc, Paso Robles, San Luis Obispo, and Arroyo Grande, and has no trouble to dispose of it, shipping it by express collect. Prices are set simply by inquiry among various growers and at the stores.

Stanislaus county is first, Imperial second, and Humboldt third in dairy products, according to the California Development Board.

T. R. Jacobs says: "Not only can the chicks from fall hatches be made to return a maximum of profit, but it is quite possible to have a very even supply of extra quality eggs during the whole twelve months by dividing the year into three hatching perlods."

Hatch Chicks This Fall.

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n. of California.]

Our series of articles regarding fall-hatched chicks has created a widespread interest in that feature of poultry culture in this State. Apparently a very large number of California poultry keepers have imagined that fall hatching not only required unusual care, but resulted in an increased percentage of mortality, besides tending to influence a reduction instead of an increase in the size of the stock. It can be safely stated that it requires no more care, but naturally the chicks must be handled somewhat differently. For instance, if the soil is adobe, the chicks must not be allowed to run on the adobe when it is wet or they will get tbeir toes covered with balls of hard earth that interfere with their free action and cause injury through exbaustion. Under such a condition, the chicks can either be kept under cover or confined by an enclosure in which the ground has been covered with straw or a thin layer of soil that when wet is not as sticky as adobe. This and other peculiar circumstances caused by climatic conditions or location can be met by ordinary fórethought or gumption; and may, therefore, be considered as trifles by anyone possessing only a very moderate determination to succeed.

T. R. Jacobs, who has been connected with poultry production in California for over thirty-five years and who has made a business of hatching and raising chicks for others in many parts of the State, says: "Not only can the chicks from fall hatches be made to return a maximum of profit, but it is quite possible to have a very even supply of extra quality eggs during the whole twelve months by dividing the year into three hatchery periods, provided that electric light is available for use in tbe roosting and scratching quarters of the laying stock during the short winter days. The lights are intended for use only from about 4:30 a. m. to 6 or 7 a. m. in order to afford the hens an opportunity to get to work early."

William C. Hull, of Mill Valley, says: "I am much interested in the articles that have appeared in the Pacific Rural Press regarding fall hatching of chicks. I had decided to purchase a lot of Ancona day-old chicks during June, but since learning the advantages to be gained by getting chicks hatched in September or October, I will postpone the delivery until then. But why do not breeders who can supply fall chicks advertise them? I am now hunting for a reliable source of supply so that I can place my order in advance."

Samuel A. Wells, formerly an extensive breeder and ex-president of the California Leghorn Club, states that his experience with fall and winter hatched chicks was very satisfactory. He contemplates putting in a large flock of Black Leghorns and want to arange for a lot of day-old chicks of that breed for delivery on or about October first.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

With the warm days, hens begin to lose interest in cackling, if you don't keep them in fighting trim. When the cackle stops the profit stops, so anything that will keep them cackling is sure a good thing. Now in my years of experience I have found that it pays two-fold to be up before the sun in the summertime. The hens that have range and can get out on it are all right—they will get their breakfast early; but those that are shut up in yards have to wait for the feeder.

Now hens are a good deal like us in some things: They do not care to be out rustling around in the heat of the day—during those hours they need rest in the shade. For that reason they should be fed early in the morning, or if you want to snooze in bed, feed in litter at night after the hens have gone to bed. Then when they get out, they need not spend the really cool hours of the day waiting, but instead they can be filling up for the next day's egg. It is not really the heat that hinders egg production, but it is from this neglect of the feeder to counterbalance tbe effects of a hot day by early and late feeding.

Some years ago a Buffalo man made a three years' test of prolonging the day for his chickens by artificial light and heat. He had a self-regulating clock and switch that turned on the gas at 5 p. m. and off at 7:30 or 8 o'clock; then in the morning it was turned on at 4 o'clock and off at 7:30. Every evening the feed was scattered among the litter so that the minute they left the perches they could commence to eat and scratch. He states that nearly all the hens had laid by 5 o'clock in the morning and that most of them were on the nest again at 5 o'clock in the evening. They averaged ten eggs a week and kept it up for three months without a let up at all. This was all accomplished by artificial light, heat, and a larger and more varied ration.

Where we have two of the things at hand from Nature, that he had to furnish at cost of labor and money, all our hens need is the forehanded man to look after the ration. Two eggs a day would not make us rich at the price we are getting, but there would be lots of fun in getting them, just out of curiosity. Daylight and heat are cheap, a variety of feed can be selected that would not be very costly but would be high in nutrition.

We must keep tbe hens on the job, not necessarily to increase the output but to bold our own. And to this end we should try to make everything as easy for the hens to produce tbe eggs as possible. If they have to wait around during the cool, pleasant hours of the morning, doing nothing toward egg production, then by the time the first meal

is served the sun is high and the hens seek the shade. They are not going to cackle very freely to fill the egg basket. The poultryman should arrange to supply his hens with a cool drink during the heat of day, as water is absolutely necessary to egg-production, and it takes more to supply the hen's needs than during cool weather, and her needs are always attended to before eggs are considered; Nature looks after that.

Sprouted oats or barley are both good feed for eggs and either one is cheaper than wheat at present prices. Corn, oats and barley are good for variety, but as a steady grain wheat is the standard grain for egg production. Now this is so because it stands high in protein and low in fibre, so that nearly every bit of a kernel of wheat stands for food that takes little of the hen's energy to assimilate. Corn stands next in fibre; but as it is too heating for hot climates, in summer it is not nearly so valuable a feed for eggs as wheat. Sprouting softens the fibre of both barley and oats, making them much easier to digest than they are in a dry state and the labor item is not so great as to cut any figure if a person really wants to make a profit on his hens. Some mash is necessary as a help and it should be served so that the hens can help themselves in the cool of the morning and evening, for it is then that they feel inclined to eat. The poultryman does the providing, keeps his houses free from mites, his hens free from lice, and if the hens are the right [illegible] they will respond with a good, Vin[illegible] cackle, even though the [illegible] a little warm.

[illegible]y Troubles. — There are [illegible] few cases of blackhead. What passes for blackhead is often nothing but liver complaint or bad cases of indigestion. The only sure indication of blackhead is when the head does turn black. The birds should in every case be isolated from the rest of the flock and given special treatment, at the same time keeping a strict watch on the rest of the flock. The best preventive of blackhead is sour milk and sulphur, the milk served as a drink and sulphur put in a little mash food or even made into pills and fed the turks, say, once a week. If no sour milk can be had, put a few drops of aconite in the water to keep the fever down. To cure "blackhead," mix four ounces of ginger, one tablespoonful sulphate of iron, half a teaspoonful of salicylate of soda, add 30 drops of oil of [illegible]entine, and water or milk to anc[illegible] to pills, giving the pills in We[illegible]ilk to the afflicted birds. re[illegible]eather gets hot turkey

raisers should try to keep the blood cool. Epsom salts in small doses put in the drinking water is a great help; so is sulphate of iron both tonic and cooling. Sulphur acts on both the blood and liver and it should be remembered that small doses are always best unless in times of emergency. Small doses of a drug may act as a tonic, while a larger dose of the same thing will act as a cathartic or an emetic. A few grains of bloodroot will act as a vermifuge and cathartic; while if the size of dose is increased, it is a violent emetic.

Another subscriber says her little turkeys are dying. Unless fuller particulars are given, it is impossible to give advice. For weak baby turks or chicks just to build them up, get a 50 cent jar of Armour's soluble beef; half a teaspoonful makes a pint of beef tea or something of that kind. Anyway it helps tide the chicks over until they can eat more and gain strength.

When the feed stays in the crop over night and feels like a little hard lump in the morning, just give about ten or fifteen drops of tincture of nux vomica in a quart of drinking water. Renew it at the same rate for a few days. Tincture of iron must be used sparingly.

Mr. S. S. S. says his turks are dying of canker under tongue, eyes watery. His turkeys are badly housed and are huddling up at night. He should make them some sort of cover to go under so that they won't crowd, then at night go and spread them out by hand; they won't crawl back at dark. If necessary separate into several small lots. Give a piece of bluestone in the water as big as a pea to a quart, then put powdered bluestone on the canker and scrape off the white.

CARLOAD OF FOWLS FROM SONOMA.

[By Geo. H. Croley.]

While it is not generally known to the people of the State, that portion of Sonoma county immediately surrounding Sonoma City is an important poultry section. The poultry breeders of that district take great pride in the quality of their eggs and are striving to keep pace with other parts of the State in improving the quality and productiveness of their flocks. As a means of keeping up to the minute in regard to the latest improvements in poultry keeping, a number of breeders had determined to visit the Universal Poultry Show at the Exposition Nov. 18 to 28, and a few had considered entering some fowls in the show, but when it became known that the breeders of Sacramento intended sending a carload of fowls to this exhibition, there was a great awakening of the leading poultrymen, which will result in a carload shipment of fancy and utility fowls from Sonoma City. We understand that by employing a car, the entire cost of transporting the fowls to the show and return will amount to only about ten cents each.

NO STATE FAIR THIS YEAR.

Sec'y Chas. W. Paine of the State Agricultural Society writes that California will have no State Fair this year on account of the two big expositions. The Legislature did not appropriate any money for premiums this year.

TAKE HEART.

Take heart! nor let th' alarmist's cry
Uproot your faith in self and kind,
Men have been weak since Adam fell,
Mistaken since the earliest mind.
And yet, the measure of results
The judgments of the race defend,
The level of the world's desire
Shows steadily an upward trend.

Take heart! What though misfortunes past,
Have dimmed the hope which once was yours?
Look up! Press on! Success is reached
By him who through defeat endures.
Though weary, work! and falter not;
Though out of heart, fight on, amain!
Was never one who kept his faith
But to his purpose did attain.

Take heart! Your altar candle's gleam
May light some wand'rer on his way,
May help revive abandoned dreams
And bring new courage for the day.
Remember, when you fain would rest,
Abandoning the half-made trail,
Another charts his course by yours
Because of him you dare not fail!

—Grace Marian Smith.

THE JOURNEYINGS OF THE LIBERTY BELL.

By Jane A. Stewart.

Our Liberty Bell is a great traveler. For an aged and supposedly decrepit body it has a good deal of traveling to do. In fact, no other revered and valued relic in all the world has ever had such peregrinations.

No one in England would seriously think of taking the throne of Scone (or the Coronation Chair), the emblem of British unity and sovereignty, out of Westminster Abbey, and giving it a trip around Great Britain for public inspection. The British idea is that the people should go to the relic rather than that the relic should journey to the people.

Here it is different, and every now and then the good Liberty Bell leaves its safe and secure haven in Philadelphia to go upon risky expeditions hither and yon, because the people clamor for it, send it such irresistible invitations, and bring such powerful and persuasive pressure to bear upon its conscientious custodian, the City of Philadelphia, that there can be no refusal.

Hazardous and full of excitement as some of the Liberty Bell's journeys have been, none on the list has exceeded in peril the very first journey which it ever took as our Liberty Bell.

It was in 1777, it will be remembered, that the British under General Howe were coming to occupy Philadelphia, and the American Army was forced to evacuate. Knowing that the British would like nothing better than to get hold of this and other rebellious bells, a party of American soldiers took it down from its place in Independence Hall (the State House) tower and placed it upon a cart with the seven chimes of Christ Church and the two bells of St. Peter's. The Liberty Bell had a rough ride to Allentown, guarded day and night by its faithful escort of two hundred North Carolina and Virginia soldiers. The cart broke down on the way under the Liberty Bell's weight of two thousand pounds, and the precious bell had a narrow escape from accident. Another stronger cart was procured, however, and it was safely deposited in Zion Church, Allentown, where it rested, safe from capture and possible conversion into British bullets, from September, 1777, until June 1778, when it was joyously returned to Independence Hall in time to ring for victory at the surrender of Cornwallis.

The second journey of the Liberty Bell appears to have been not a perilous one. It was a very different trip from that of the first days of the young Republic, when the people were striving for freedom as a nation. Over a century had passed, and now the bitterness not only of Revolutionary days but also of civil warfare had died away. Then the nation realized as never before the sacredness and usefulness of the Liberty Bell. The pressing invitation of the Cotton States Exposition managers at New Orleans was accepted, and the Liberty Bell made a memorable and significant trip.

As it traveled toward New Orleans in January, 1885, Jefferson Davis, the leader of the Southern Confederacy, came from a sick-bed to look upon it. He boarded the train at a point west of Mobile, Ala., with his little granddaughter, whom he lifted up in his arms that she might kiss the Bell. Bending his uncovered head and bowing over it, he said:

"I believe the time has come when reason should be substituted for passion, and when we should be able to do justice to each other. Glorious old Bell, the son of a Revolutionary soldier bows in reverence before you."

Such were the precautions taken for the care of the Liberty Bell at that Exposition that it was never removed from the handsome flat car on which it made the trip to and from New Orleans on its errand of inspiration.

All the great Expositions have rejoiced in the wonderful presence of the Liberty Bell. To Chicago in 1893, and later to Atlanta, Charleston, and St. Louis the old Bell has cheerfully and triumphantly journeyed, greeted everywhere in a manner befitting a historic and significant relic by the patriotic and appreciative people.

"At Charleston," wrote an eyewitness, "I saw some of the people bend over its edges in their eagerness to kiss it, and many seemed to feel as if its presence was sacred, as votaries do at the altar of their church. . . . There could be no possible mistake that the Bell symbolized a feeling that was in the very fibre of their being."

Everywhere it was acclaimed by multitudes with patriotic ceremonies, greetings, holidays, flower wreaths, and choruses of young and old.

In 1908 the Liberty Bell re-enacted its own first journey, being swung on a rude cart to travel in imagination again to its haven in Allentown, as part of the great Philadelphia Historical Pageant, a patriotic object lesson for the thousands who saw it.

The longest journey which it has been called upon to take is that of 1915. In response to the insistent petition of the people of the Pacific Coast, the Liberty Bell travels six thousand miles to and from Phila-

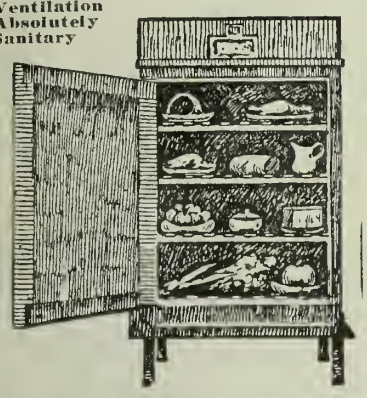
Why Suffer Longer From Ants?

When Their Extermination Is A Comparatively Simple Matter?

If you should ask the average housekeeper to name the principal annoyance with which she has to contend, ants would invariably be given a prominent place in the list.



This will not hold true for any great length of time, however, for women everywhere are rapidly learning of the great discovery made by a baker and candy-maker in Los Angeles, whose place was over-run with ants, but who originated a paste which rid his shop entirely of them in one day. So rapidly did the news of the discovery spread that it was necessary to build a large factory to supply the demand.

This remedy is put up for general use under the name of Kellogg's Ant Paste and can be obtained at all good druggists. Women everywhere are using it with surprising results. Try a package today.

delphia to become the most notable historic feature of the great Panama-Pacific Exposition. The petition was two miles long and contained 500,000 names. It is likely that on this journey more people will have an opportunity to look upon it than on any other of its notable pilgrimages.

FARM SEWAGE.

The farmer who is making his business pay, ought to enjoy the conveniences and modern improvements in living which he would expect and accept as a matter of course in a city. When he buys city property, he pays for every improvement that goes with it and a good round tax annually for upkeep.

When the farmer's boy goes to town on a visit, the comparison is apt to be in favor of the ranch, if the home is comfortable and sanitary, so that his friends have "nothing on him."

The modern substitute for the outhouse and the sour smelling sink furrow across the backyard is a septic tank. This is a permanent improvement, into which the house wastes may be flushed, year after year, with little or no attention.

The process taking place in the septic tank is as follows: The sewage is purified by a chemical change resulting from the attack of two different kinds of bacteria.

First come the anaerobic bacteria; they are found living in all mixed sewage. These thrive best where it is dark, air is excluded and material kept quiet. They set upon the solid materials, attacking and digesting them and turning them into a thin liquid.

Second come the aerobic bacteria which are found in the surface soil. They thrive in sunlight and air. They complete the purification of the liquid after it leaves the tank so quickly that it becomes fit to drink after going a little distance.

The tank is completely inclosed and divided into two tanks or compartments by a partition wall crosswise. The sides, floor and roof may be of 1:2:3 cement mixture, except the roof or cover of the second compartment, which can be of boards, hinged or free.

The cement is 4 inches thick throughout. A square man-hole is left in the roof of the first compartment with beveled out edges, so the lid will fit in closely to exclude air.

The tank may be placed close to the house if desired. Glazed 4-inch sewer pipe enters the first division close to the top with an elbow through the wall and extension down to 18 inches from the floor, which reduces the disturbance from incoming matter. It is well to keep this quiet. Sludge or thick foam forms on top, tending to seal over the surface and promote bacterial breeding.

As sewage enters the first tank, an equal amount of liquid is displaced and flows over into the second tank. To prevent any sludge or solid matter floating over, a gap or wier is left in the top of the partition wall, about 1 foot wide and 1 foot deep, guarded by a redwood baffle board across the tank, 4 inches in front of the gap and 6 inches below and 6 inches above the gap sill (i. e., a 12-inch board). The baffle board slips into grooves left in the side walls. Don't forget to make these grooves.

The method of discharging the liquid collected in the second tank depends upon the slope of the land. It may be allowed to dribble out, or the tank full discharged at one time through an automatic air releasing siphon.

In absolutely flat country, it is a problem where to put the discharge. Have a well driller bore and case a 4- to 6-inch hole in the floor of the second tank, tapping a wet sand stratum that does not affect the water supply. Let the casing stick up in the floor of the tank 2 feet, and hang a collar of larger casing around it, which will form a trap to exclude any possible floating matter from the drainage well.

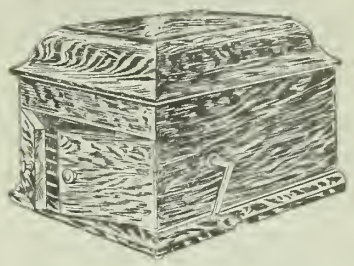
From experience, I would say, the smallest sized practical septic tank is 4 feet wide, 8 feet long, and 6 feet deep, with partition wall in the middle. This will provide for thirteen people.

In building larger tanks the second compartment may remain of the same size, but the first should be increased 6 cubic feet for each additional person. This allows 50 gallons apiece, or 25 gallons daily resting for 48 hours digestion.

Oakland. Wm. Curtis Clark.

"Birds are often brighter than human beings, Mrs. O'Flaherty." "Right yez is, Misther Parkins. We have a bur-red in this place what knows more than Pat Gallagher. He can tell the toime of day better than Pat. They have a clock in the next room; an', phin it's toime to tell th' toime, that bur-red comes out an' says 'cookoo' as many toimes as th' toime is." "That is wonderful," I said. "It is indade," said Mrs. OFlaherty; "an' th' wonderful pa-rt ov it all is it's only a wooden bur-red at that!"—Eli Perkins.

A Hoosier lad of twelve years was industriously at work upon a pile of wood in his mother's back yard, when he was approached by a playmate. "Hello, Ben!" said the youngster, "do you get anything fer cuttin' the wood?" "Well, I reckon I do," replied Ben. "Ma gives me a cent a day fer doin' it." "What you goin' to do with yer money?" "Oh, she's savin' it fer me; and when I get enough, she's goin' to get me a new axe."



Little boy caught a very severe cold while his mamma was out of the city, and on her return rushed up to her, and, throwing his arms around her, cried, "O mamma! both of my eyes is raining, and one of my noses won't go."

Mrs. Newrich, with a slight knowledge of flowers, said to her new gardener: "James, I desire to have this bed planted with Saliva. What do you suggest for an appropriate border?' James, with greatly suppressed emotion: "I would recommend Spitoonias, ma'am."—Selected.

DOUBTFUL.

"Arthur seems a bright, capable fellow. I think he'll get on."

"Well, he's certainly a worthy young man, but I doubt whether he has head enough to fill his father's shoes."—Boston Transcript.

The Markets.

San Francisco, June 30, 1915.

WHEAT.

Prices are rather uncertain at present, having undergone some fluctuation. The present level is considerably lower than last week, but better prospects for export trade have brought a steadier feeling within the last day or two.

Cal. Club, ctl.	$1.70	@1.72½
Forty-fold	1.75	@1.80
Northern Bluestem.	1.80	@1.85
Northern Club	1.70	@1.72½
Northern Red	1.70	@1.80

BARLEY.

Values are little more than nominal, as buyers are slow to take hold and trading of late has been closely limited. New barley is offered in considerable quantity, and seems to contain an unusually large amount of poor stock.

Choice Feed, ctl. ...$1.02½@1.05

OATS.

Both red and white are quoted a little lower, though first-class offerings are pretty steadily held, with moderate supplies on this market.

Red Feed	$1.35@1.45
White	1.45@1.50

CORN.

Values are unchanged, local offerings of most grades being rather light, while there is a steady demand for feeding. There is hardly enough white Egyptian here to quote.

California Yellow	$1.75@1.80
Eastern Yellow	1.80@1.85
Milo Maize	1.75@1.80
Manchurian	1.40@1.60

BEANS.

Prices show no change whatever since last week. The market is somewhat steadier than it was, but local dealers say there is very little movement, and the outlook is uncertain. Supplies are not believed to be excessive, and should be fairly well out of the way when new stock comes in, though they have not been moving very much for some time.

(On Wharf.)

Bayos, Cal., per ctl.	3.75@4.00
Blackeyes	5.50@5.65
Cranberry Beans	4.00@4.25
Horse Beans	3.50@4.00
Small Whites	4.00@4.15
Large Whites	3.90@4.10
Pink	3.40@3.50
Limas	4.00@4.15
Red Kidney	4.90@5.00
Mexican Reds	4.90@5.00

SEEDS.

Business in all descriptions is very quiet, with no new stock coming in yet, and practically no demand in any line.

(Wholesale prices, San Francisco.)

Alfalfa	17½@18½c
Brown Mustard, per lb	Nominal
Canary	10@12½c
Hemp	3@3½
Millet	2½@3 c
Timothy	7½@8 c

HAY.

Shipments to this market continue heavy as before, consisting mostly of old crop hay, though a little new hay has appeared. A large part of the hay arriving is going out to other markets, the local demand showing only slight activity. There is said to have been quite a lot of buying of new hay in the country iately, almost entirely limited to the most desirable grades of hay, ordinary stock finding little demand. Prices for the most part have been about in line with old-crop values. New second cutting alfalfa shows very good quality, and is readily disposed of, though some old alfalfa is still coming in.

(Prices per ton, carload lots, on track, San Francisco.)

No. 1 Wheat, per ton.	$11.00@11.50
do. No. 2	8.00@9.00
Barley	5.00@8.00
Tame Oats	7.50@12.50
Wild Oats	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, per bale	.40@.45

FEEDSTUFFS.

Rolled barley is very weak, but not quotably lower. Most feeds are rather easy, owing to abundant crops, though there is a fair demand for this time of year.

(Wholesale prices per ton, carload lots, San Francisco.)

Alfalfa Meal, ton	$14.00@15.00
Alfalfa Molasses Meal per ton	18.00@19.00
Bran, per ton	29.00@30.00
Oilcake Meal	None here
Cocoanut Cake or Meal	25.00@26.00
Cracked Corn	40.00@41.00
Middlings	34.00@36.00
Rolled Barley	23.00@24.00
Rolled Oats	33.00@34.00

VEGETABLES.

Supplies in a good many lines continue to increase, and while the market is active values are on the down-grade in most varieties. Beans and peas are offered quite freely, both showing a decline, and lima beans are offered in considerable quantities. Asparagus and rhubarb are still in ample supply at the old figures, and celery and lettuce are steadily held. Bell peppers are lower, and larger offerings of Merced tomatoes are bringing lower prices in this line. Eggplant and summer squash also are lower. Green corn is in good demand, and choice offerings still bring high prices.

(Wholesale prices, San Francisco.)

String Beans, lb	2@3½c
Lima Beans	5@8 c
Celery, crate	50@1.25
Lettuce, crate	.75@1.00
Asparagus, box	$1.00@1.50
Peas, sack	.75@2.00
Peppers, bell, lb	10@12½c
Tomatoes, crate, Merced	.35@50c
Rhubarb, box	40@65c
Cucumbers, So'th'n, lug	50@60c
Eggplant, lb	4@7 c
Summer Squash, lug	40@50 c
Green Corn, sack	1.00@2.75
Okra, crate	.75@1.25

POTATOES AND ONIONS.

Oregon potatoes in this market are about cleaned up, and find little demand with increasing offerings from the Delta. New river stock is easy at a rather sharp decline. Yellow and red onions are bringing about the same figures, the latter being a little firmer. Australian are being cleaned up at irregular prices, while Bermudas are firm. Garlic shows a further decline.

New River Potatoes, ctl.	.75@1.00
Onions, yellow, sk	60@65c
Red, sk	60@65c
Bermudas, crate	.90@1.00
Garlic, per lb, new	5@7 c

POULTRY.

The drop of last week has caused some curtailment of shipments from the east, and current offerings are cleaned up more readily, though quoted values show no improvement.

(Wholesale prices, San Francisco.)

Live Turkeys, lb	15@17 c
Broilers	19@21 c
Fryers	22@23 c
Hens, extra, per lb	16@17 c
Small Hens, per lb.	13@14 c

Eggs	25	25	25½	25	24½	23
Cal. Cheese	12	12	12	12	12	12

DECIDUOUS FRUITS.

Pears are the only new variety added to the list, while gooseberries are no longer quotable. Offerings of cherries are diminishing, though a good many are still coming from California points, and northern stock may be offered for some time. In the berry market, black loganberries and raspberries are the only varieties to hold their own, everything else being much lower; and declines are the general rule in the fruit market, except on cherries. Plums, figs, and apricots and peaches in small boxes are all lower. Watermelons still hold about the same, but a drop is expected soon; and cantaloupes are easier, with quite large supplies. Apples are steady, with limited offerings so far.

Loganberries, blk, chest.	$2.00@2.50
Loganberries, red	2.50@3.00
Strawberries, chest	3.00@5.00

Standard crate	1.25@1.50
Watermelons, lb	½@1½c

DRIED FRUITS.

In the fruit line, spot prunes are the only article to show much firmness, as there is quite a lively demand in consuming markets and supplies here are closely cleaned up. New crops show no change, and are gradually being contracted at the prices quoted. A few small lots of old apricots are appearing, but there is little left, and there is a fair demand for spot stock. Such new goods as have appeared, however, have brought no advance over the recent quotations. Figs, especially Calimyrnas, are quite firm, as difficulty is expected in getting supplies from Turkey. Peaches are neglected, and the present attitude of canners is not at all favorable for the dried peach situation. Seedless raisins are decidedly stronger and higher, as it is anticipated that England as well as the eastern states will depend largely on supplies from California. The New York Journal of Commerce says:

"A sharp advance has been made in spot California prunes, sizes 40s to 50s, 50s to 60s and 60s to 70s. The principal holder of California prunes demands 11c for 30s to 40s in 25-pound boxes for delivery from July 1 to 10. The same factor quotes spot New York for 40s to 50s 10c for prunes in 25-pound boxes and 9½c for lots in 50-pound boxes. The Coast market for old crop is about ½c higher, with a 6½c basis quoted on 40s and a 6c basis quoted on 50s to 90s, inclusive. The market will have to depend upon the very light available supplies until the first shipments of 1915 crop are made about the first of October. It is said that a further rise in the prices of spot prunes here may be made within a week or so.

"The export business with Europe is apparently falling off, for fewer inquiries are said to be coming in and the sales which are being made are correspondingly limited.

"Rumors are still prevalent in the trade that concessions of from 2½ to 3 per cent are being made on raisins off the price quoted by the Associated Company for August-September shipments. Several factors claim that they have been offered this discount and say that it is being offered to other buyers. Spot seeded raisins are being held steady, but the market is no higher in price. Some business is being done on future seeded raisins in cartons for September and October shipments from the Coast at 6½c on fancy and 6¼c on choice.

"Apricots are said to be greatly reduced in stock and market remains firm. Prices are lower on the Coast for future delivery, ranging about 6½c for extra choice and 6c for choice."

(Prices to Growers.)

Seedless Sultanas	5 c

CITRUS FRUITS.

The Valencia orange demand is still keen in the east and prices very satisfactory, while lemons continue to drag.

At New York on Monday, June 28, the auctions averaged from $4.55 down to $2.55 for valencias. St. Michaels brought from $3.25 to $3.55 per box. Lemons $1.10 up to $2 per box. The same day at Boston paid as high as $2.70 for lemons. It is estimated that there are about 5,000 cars of valencias in southern California yet to be marketed. Shipments are going forward at the rate of more than 100 cars daily.

While the San Francisco demand is somewhat curtailed by the liberal offering of deciduous goods, values in general are pretty well maintained. Second-crop navel oranges move slowly, and are somewhat lower in price; but valencias are held at an advance. Grapefruit and lemons are unchanged.

(Wholesale prices, San Francisco.)

Oranges, navel, box	$1.00@2.50
Valencia, box	2.25@3.25
Grapefruit, seedless, box	1.75@2.25
Fancy	2.25@2.75
Lemons, box	1.50@3.50

NUTS.

Walnuts are scarce and firm, values being entirely nominal. New almond prices will be named by the Exchange early in August. Meanwhile some of the packers are making strenuous efforts to get prices down, some having offered to cut under the lowest price named by the Exchange; and some have named prices to the trade as follows: Nonpareils, 16½c; IXL's, 14c; Ne Plus Ultra, 13c; Drakes, 11¾c; Languedocs, 11¼c.

(Prices f. o. b. San Francisco.)

Almonds, 1915 crop:	
Nonpareil	17 c
IXL	14½c
Ne Plus Uutra	14 c
Drakes	12½@13 c

Ewes	11½@12 c
Suckling lambs	14½@15 c
Hogs	12 @12½c

WOOL.

There is quite an active movement of wool, though a good deal of the California clip is still left, having been held at higher prices than the trade would pay. Dealers note some strength in the market, owing to possibility of export trade, though southern wool is lower than last quoted.

Wool, Sacramento Valley, lb	18@22c
Southern, year's staple	15@18c
Six months	14@16c

HORSES.

A good sized shipment of light to medium stock came in from northern California this week. In the local market, heavy stock of desirable types is rather scarce, and while there is no very urgent demand such horses command good prices. Buyers show little interest in ordinary offerings, though there seems to be a fair demand around the country, and some large lots of horses and mules for shipment to other quarters have been bought up through the valley district.

(Approximate values at San Francisco, based on auction sales.)

Heavy drafters, 1700 lbs. and up	$275@300
Light drafters, 1550 to 1650 lbs.	175@200
Chunks 1350 to 1500 lbs	150@175
Wagon horses, 1050 to 1350 lbs.	100@140
Green Mountain range horses, 950 to 1200 lbs	50@ 90
Farm workers	60@ 75

MULES.

1200 lbs. and up	$225@250
1100 lbs.	200@225
1000 lbs.	150@175
900 lbs.	125@150

HIDES.

The hide market is decidedly strong, and the anticipated advance has been made this week.

Heavy Steers, over 56 lbs.	16 @16½c
Medium	16 @16½c
Light Steers, under 48 lbs	16 c
H'vy Cows, over 50 lbs.	15½@16½c
Light Cows, 30 to 50 lbs.	16 c
Kip	16 @17 c
Veal	17 c
Calf	17 c
Dry Hides	27 @28 c
Dry Kip, 10 to 15	26 @27 c
Dry Veal, 5 to 10	31 c
Dry Calf, 7 down	31 c
Horse Hides—	
Salt: Large	$3.00
Medium	2.50
Small	1.00

HOPS.

The outlook for foreign shipment is improving, and with a strong demand from England the market is much stronger. Prices show considerable advance, and some large contracts have been closed in the last week.

1915 crop, lb	8½@11 c

SPECIAL DECIDUOUS MARKET REPORT.

By J. L. Nagle.

Sacramento, June 28, 1915.

All markets during the present week showed considerable decline under the previous week's ruling prices, due to increased receipts not only from California but from Oklaboma, Louisiana, Texas and Georgia.

Shipments of cantaloupes have also increased to approximately 180 cars a day from the Imperial Valley, and as the Northwest is now moving apricots and cherries and as the Middle West, Southern and Eastern states are shipping berries in large quantities, this entire movement is responsible for the present unsettled condition of the markets and we fear that there will be no change for the better, except spasmodically, for some time.

The following prices have ruled for the week:

New York—Climax Plums averaged $1.00; Formosa Plums, $1.15; Clyman Plums, 79c; Red June Plums, 89c; Burbank Plums, 80c; Tragedy Plums, $2.10; Royal Cots, 92c; Moorpark Cots, $1.05; Early Rose Cots, 70c; Newcastle Cots, 60c; Alexander Peaches, 76c; Triumph Peaches, 74c; Eulatis Peaches, 85c; Royal Anne Cherries, 71c; Republican Cherries, 83c; Tartarian Cherries, 80c; Oregon Cherries, 81c; Bing Cherries, $1.23; Lambert, $1.16; Nonpareil Cherries $1.05.

Chicago — Royal Cots averaged $1.02; Alexander Peaches, 73c; Triumph Peaches, 98c; Clyman Plums 87c; Climax Plums, 89c; Abundance Plums, 90c; Tragedy Plums, $1.71; Burbank Plums, 88c; Red June Plums, 91c; Formosa Plums, $1.00; Maynard Plums, $1.83; Santa Rosa Plums, $1.26; Beauty Plums, $1.15; Oregon Cherries, 85c; Royal Anne Cherries, 80c; Republican Cherries, 83c; Bings, $1.03; Tartarian, 79c.

Philadelphia — Royal Cots averaged $1.00; Clyman Plums, 80c; Red June Plums, 68c; Burbank Plums, $1.07; Formosa Plums, $1.00; Climax Plums, 95c; Beauty Plums, $1.02; Alexander Peaches, 98c; Bing Cherries, $1.57; Republican Cherries, $1.27; Lambert Cherries, $2.75; Tartarian Cherries, 82c; Bigarreau Cherries, 92c; Royal Anne Cherries 77c.

Total shipments to date 1190¾ cars as against 1735¼ cars to same date last year.

Publisher's Dept.

Our readers will recollect the announcement a few weeks ago in these columns of the "California Annual" then being printed. The completed book reached our desk this week and is in every way the most ambitious effort ever made in publishing lines on the coast. Mr. R. L. Bernier is the man who visualized the idea and for a year has worked steadily in the effort to make it a reality. Many leaders in all lines of productive endeavor in California have written special articles and they have all been passed upon and put into book form by Prof. Wickson. The book contains nearly 700 pages of text, half-tones and four-color plates, and is the finest job of printing we have seen in the west. Since making the first announcement, Mr. Bernier changed the name from "California Annual" to "California's Magazine" and the price is fixed at $1.50 per copy. Address "California's Magazine, New Call Bldg., San Francisco.

Since last week we have added 182 paid subscribers to our list—not quite up to our usual quota, but nearly so.

The publisher of this journal is at present, with Geo. H. Croley, making personal investigations in the poultry industry, and the results we hope to have Mr. Croley furnish in a series of articles in the Rural Press shortly.

A new book, "How Farmers Cooperate and Double Profits," by Clarence Poe, is one of the latest to reach us. In this book is given the principles of co-operation along all production and marketing lines. It is a book of stories of actual experiences of co-operative societies in the west, south and east, also in Europe. The book contains 256 pages and sells for $1.50 net. Published by Orange Judd Co., 315 Fifth Ave., New York.

One of the latest Beet Tools on the market is the Four Row Beet Lifter, designed and built by the Killefer Manufacturing Company, of Los Angeles. The writer had the pleasure of witnessing a preliminary demonstration of this tool, held on the Bixby Ranch near Long Beach, a few days ago. Beet agriculturists from all the large ranches in the southern part of the State were in attendance and one and all pronounced the tool a success in every respect. The Lifter is self contained and by simply engaging a dog will lift or lower itself as the operator may desire. This device is very strong and simple, raising or lowering the tool in less than three feet of travel. This tool can also be used very effectively as a subsoiler, its weight, strength and ease of handling making it possible to break up practically any soil regardless of hardness or previous packed condition. In fact the lot where the demonstration was given was a dairy feed lot, that had not been touched for years with a tool of any description.

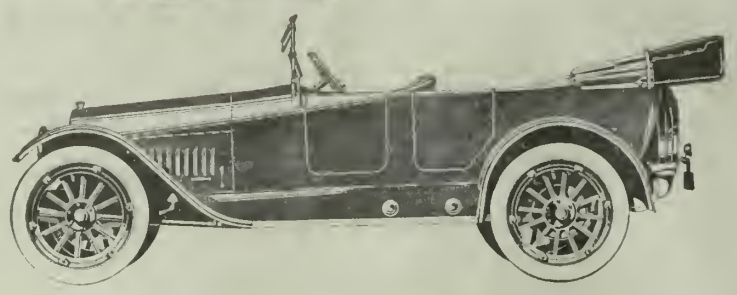
LOCAL HORTICULTURAL QUARANTINES.

Rulings under the new Horticultural Commission Law, prohibit the transportation of all kinds of plants or parts of plants from one part of the State to another, except when accompanied by a certificate of inspection signed by State or County horticulture or quarantine officers, and each package must have the name of the shipper and of the locality where the goods were grown. Whenever such horticultural products are shipped, a detailed statement of the contents of each package must be sent to the county horticultural commissioner of the county into which the goods are shipped. No one may receive such shipments until they have been inspected by the proper officers.

The State Horticultural Commissioner is empowered to quarantine districts for any new or dangerous insects or animal pests, fungus, or other plant diseases for which there are no means of eradication, and where such menaces to horticulture are not already distributed to all parts of the State.

The horticultural force may require the treatment of all plants found infested at any place in the State. Plants or trees affected with crown gall, root knot, or other serious incurable disease, must be destroyed.



All nursery owners and dealers in nursery stock must register with the county horticultural commissioner data on the acreage, variety, number of trees, and their location whenever the county horticultural commissioner desires. Permits obtained from the county horticultural commissioner are required for all outfits doing public spraying or fumigation work. Such permits are to be issued only after examination of the apparatus and of the operators, in order to insure thorough work.

No potatoes may be planted in California if infested with eel worm, tuber moth, rhizoctonia, Fusarium wilt, scab, or other fungus diseases, except that potatoes infested with scab or other curable diseases may be planted if properly treated.

No horticultural products may be shipped out of the State without first being inspected by county horticultural commissioners or quarantine officers; and whenever certain classes of plants are shipped into the State by parcels post or otherwise, they must be inspected before being received by the consignees.

One thousand acres of the land in Sutter and Yuba counties purchased by the Scandinavian-American colony will be colonized during the coming year, 2500 the following year, and so on until the 10,000 acres are settled. A contract for the work of colonization has been made by the colony with the Natomas Consolidated Company.

THE SCHMEISER PORTABLE AUTOMATIC DERRICK

THE HAY STACKER THAT SAVES TIME, WORK AND MONEY

This derrick will handle hay, loose or baled, in the easiest, quickest and most economical manner known. It is always ready, is portable and can be moved from place to place as easily as a farm wagon. With it three men can do the same amount of work as nine men by hand. Has great lifting capacity and is unequalled for hoisting machinery, timbers, or heavy loads of any kind.

WRITE US TODAY and we will send you descriptive and illustrated literature. The Schmeiser Portable Automatic Derrick is not an experiment. It is the result of 25 years of actual experience gained in farming. It is being used with great success all over the Pacific Coast. Write us NOW for full details explaining just what it can do and how it can save you time, work and money. Address

SCHMEISER MANUFACTURING CO.

State Commission Markets

[By Assemblyman H. E. McPherson, of Santa Cruz County.]

THE State Commission market, as provided for by the new law passed by the last Legislature, is to be presided over by a State Commission Market director to be appointed by the Governor to receive a salary of $5,000 a year. He is to appoint all of the commission market employees that are under him according to civil service regulations. He is to establish branch markets wherever conditions justify, wherever there is a demand, and the business is to grow only as there is a demand. There is a small appropriation of $25,000 provided for the installation of this proposition. It is meant that the State Commission Market be self-supporting; that in competing with private commission houses it will give them fair competition, without anything in its favor to make the competition other than fair. The idea is to regulate private commission houses in California, not by arbitrary fixed rules and regulations which work to a disadvantage very frequently, rather than to an advantage. but to regulate by competition with the State.

"The idea is to take up the proposition in a very modest manner, to take up, for instance, the simpler farm products, such as eggs and chickens and butter and garden truck, to start the proposition on a simple scale, to establish certain principles, to test the plan in certain ways, and then, as time passes, if there is a demand, it will grow; like the seed of the acorn, it will grow into the oak, provided the soil is fertile and there is a place for it.

"The State Accident Insurance Commission was established in California just a short time ago, and you all know of the general feeling at that time that private insurance companies would be ruined, and that here was the State doing that foolish thing of going into competition with private concerns that are backed by millions. What has been the result? The State insurance policies are but a small percentage of the insurance policies of California, a very small percentage, and yet the abuses of private insurance companies have to a large extent been cured, because of the fact that the private insurance company knew that if it did not come to time, if it did not meet the terms of the State insurance company, it would lose its business. The rates of compensation insurance have been reduced, and in many other ways has there been a general improvement.

"This is the idea back of this State Commission Market. There is nothing revolutionary about it, no desire to go into the field and entirely absorb it and drive out private concerns; in other words, it is to go in there to save private concerns unto themselves.

"From my investigations the commission men of this State are high grade of men. Of course, there are those among them who are a blot on the name of the business in general, just as there are in every business; and I want to say in fairness to them that I am sure that they rank as high as the producers who send them their products and the consumers who buy their products. One thing to start with in considering State marketing, is the statement from the Secretary of Agriculture in Washington that out of every dollar which consumers pay for farm products fifty-four per cent goes to the middleman. Think of that. Forty-six per cent out of every dollar goes to the producer.

Hon. H. E. McPherson, "Father of Law Establishing State Commission Markets."

"Next we want the natural scientific law of supply and demand to set the price in this State. We do not want a small ring of buyers to get off into a room by themselves and arbitrarily fix a price and have that the price of the State. With private commission men the idea is not to work for a philanthropic proposition, and think and plan for the interests of the producers, or for the interests of the consumer. They are working selfishly for their own interest, and the great people of this State are simply a secondary consideration. And if you had a State commission man, a director, who is serving under salary, who has no personal interest to serve by working to the disadvantage of the State in general, there would be a different aspect toward commission business.

"One problem that we have to solve—how to overcome the waste that is brought about by the present conditions, where the private commission man has no other motive than making his own profit. The waste is not of his affair. He does not lose by it. If you have a State Commission Market all good produce would be sold for some price, and the farmer get something for his money, certainly he is better off, and certainly the consumer is better off; and, as I understand it, eighty per cent of our population are in the consumer class.

"Take the city of San Francisco. To your great population of labor, toiling for a livelihood, the one primary thing of their life is food. Fifty-four per cent they have to pay to the middleman. If fruit, a perfect food, of which much is now allowed to rot under the trees because of the prohibitive cost of distribution, could have been brought to this market, and could have been sold for some price, surely the world would have been better off.

"I am speaking simply of the things in which I have personal knowledge, and which caused me to introduce this bill. Now consider fish. Monterey bay teems in fish of all kinds, and people of San Francisco pay many prices for it. The hardy fishermen in my town go out upon the high seas and risk their lives and bring in the treasures of the deep. They send them to San Francisco to your fish trust. They get for sole and other choice fish about two cents a pound, three cents or four cents, or when the fish is scarce and the storm is on, five and six cents—fish for which you pay up to twenty cents a pound. The cost and the waste is in distribution. Yes, you will admit that fish is thrown into San Francisco bay. Since I have been up in Sacramento I saw in your daily press of San Francisco, and it was not denied so far as I know, the statement that hundreds of boxes of fish were being dumped daily into San Francisco bay to keep up the price. Oh

Los Angeles	.00	.00	.00	80	56
San Diego	.00	.00	.00	74	58

THE WEEK

California celebrated the great national holiday at her two great Expositions: at San Francisco and San Diego. It was very fitting because these two Expositions are exponents of California patriotism and national joy, and multitudes, of surprising numbers, signified their acceptance of this view by their participation. The celebrations also lifted the voice of California for the peace of the world, and this, too, is the ruling patriotic sentiment of the United States. Ex-Secretary of State William Jennings Bryan voiced it in a peace sermon of quiet force and dignity, and worked out his faith by refraining from participation in the military parade, preferring to serve his principles by feeding the doves in the "Court of the Universe"—for there are plenty of doves in the Exposition's Court of the Universe, though the mundane fraction of that territory is sadly shy of them. But the Exposition's doves were not frightened by the Exposition's military parade, and some people have wondered whether indeed it was necessary for Mr. Bryan to retire from what, from the present point of view, must be regarded as a joke on armament, in order to support his consistency in peace. Would it not rather have been more consistent for Mr. Bryan to have affiliated joyously with our current military outfit, for surely, if other nations had such an army as we have there would be no war in the world!

Live Stock a Factor in California's Future.

We hope readers generally noted the penetrating communication of Symmes and Means, agricultural experts of this city, on page 12 of our last issue. The Pacific Rural Press willingly accepts the suggestion that it assume leadership in a systematic effort to vastly extend the live stock industries of the state. We have already shot off a few million dynamite shells in that line of attack—most recently, as readers may remember, upon the millionaires who are lying listless in the trenches on their idle lands, waiting to be showered with sugar plums of increased land values created by the busy owners of adjacent lands. We have tried to scold them into doing something for their own progressive enrichment and for the good of the State. We have tried to show them that the way to make their land pay fair taxes and yield them a profit besides, is to stock it and operate it for animal products, and for its own soil-improvement. Idle land held for unearned increment in value is the curse of any commonwealth. It depresses the present and dims the future. We have scolded the millionaires first because they deserve it, because they have plenty of capital to make their lands active, and because scolding does not make them feel bad. We hate to scold people who take it too deeply to heart, for they are apt to get mad and that plays hob with our subscription list. Therefore, as we go forward with this effort to multiply California's live stock census, it will be largely by suggestion rather than by scolding; by exhortation rather than by arraignment.

What Nature Did for Fertility.

Our correspondents throw us violently against a most fundamental phase of the effort to build up California's live stock industries by their claim that the effort should be made for the sake of the land and for increasing its power to produce the other special products upon which the agricultural fame and wealth of the State now rest. That view is absolutely true, but not adequately understood and appreciated. The permanent fertility of the land is really the bed-rock upon which all our enduring agricultural and horticultural development must be firmly established. California lands were usually endowed with the elements of permanent fertility by nature, and there are still deep, open loams which, with good tillage and moisture, may be just as rich as ever and may still have plant food ample for a century of rational cropping by good tillage and rotation. But as a rule, the lands have been temporarily robbed of their capabilities by bad farming and by total disregard of the principles in accordance with which fertility can be made reasonably permanent.

Nature pursued soil-making in this State in the very highest style of her art. She pushed the mountains up with volcanoes and other central uplifts; she ground the exposed rocks with glaciers which carried their grists to the lake and sea bottoms in the valleys. As the climate changed, she employed torrential rains and streams to carry disintegrating rocks for valley-lifting with alluvial loams; other stuff she washed or blew around into colluvial loams; and other stuff still, which was too lazy to float or fly, she simply disintegrated by subtle processes where it lay. Various other materials she produced by various processes, until long before historic times California had soils which are the analogues of all the good soils which the world has or knows—predominantly deep, open and rich. Then, as with other great population-carrying soils of arid regions, nature measured the rainfall—so that minimum washing away of plant food was secured, and limited the temperature so that plants could lay hold at once upon the moisture as it fell and make monstrous growth during the half-year of moist soil and air. Such growth, falling as it matured, carpeted the land with a natural mulch of plant-wreckage, which subsequently decayed into vegetable mold and was worked into the soil by swarms of earth-burrowing animals, worms and insects, working up and down with the rise and fall of soil moisture, admitting air and micro-organisms to great depths and promoting fertility in various forms to several times the depth of its occurrence in the soils of humid regions. Upon such pastures came the antelope and other wild grazers of prehistoric times and continuing until joined by horses and horned stock, breeding wild from break-aways from Spanish pioneers—all adding to the soil richness which awaited the advent of the American argonauts, who took to plowing the plains after the gold discovery. It was this natural endowment of fertility which greeted the late Uncle John Wolfskill, when in the 40's he rode on horseback westward from Sutter's Fort, brushing the wild oats from his face, from time to time, that he might catch a sight of Putah gap in the Coast Range to steer his course, and during the trip, as he used to say, he saw seven grizzly bears standing erect and lifting their periscopes above the surface that they, too, could see the landscape and direct their submarine courses through the tall vegetation of the emerald sea.

What Man Did with Soil Fertility.

It is unnecessary to recount the methods of soil-skinning which the pioneers practiced, nor are they to be too hastily blamed for them. The soil, whenever moisture was adequate, turned their seed into colossal growths, which almost defied their harvesting methods and machinery. Labor, too, was scarce, ornery and expensive—inversely as costly and inefficient as the work to be done was great. What could they do but skim, to keep the growth within reach. How could they prepare for such growth and handle it, except by giving each laborer they could secure a great bunch of stock and a gang-plow which could turn a dozen shallow furrows at once? How could they harvest the crop except by giving each laborer a bunch of stock and a header to cut a swath of twenty to thirty feet at each crossing of the fenceless plain? How could they haul the crop, except by giving each teamster a bunch of stock and a whole train of wagons? The problem was to get less riotous growth from the land and to multiply the power of a man to handle it. And so there came into American agriculture the California style of farm implements: reapers with sickle-bars fit to cut shrubbery; headers of world-beating breadth, threshers of greater cylinder-length than ever built before; farm wagons of double tonnage—and all that. Therefore, do not blame the pioneers of sixty years ago over-much; they had their problems, which have largely passed with them, and they did what they could.

But though we are disposed to defend the first run of California soil-skinners, it is perfectly true that thirty or forty years ago the pioneer processes should have stopped and reasonable policy for soil conservation should have actively prevailed. But the foresight of the pioneers was not as good as the hind-sight of today, and really they did not know that they were killing the lands they had succeeded in subjugating. And they deceived themselves with fallacies arising from shallow thinking. They tried manuring by using manure in ways not suited to arid conditions, and concluded that manure killed crops. They plowed deep without proper after-working, and concluded that

deep plowing injured the land. They scouted rotations because they believed nothing would grow on the land but grain. They took to summer-fallowing and gained something by it, but summer-worked the land so ill that it became ruinously foul with weed-seed, though at first it was probably the cleanest land under the sun, except for its content of native annuals which were less noxious than the world's trampweeds which disastrously multiplied. And so land which nature made aboundingly rich came in half a century to be surface poor, hateful and foul and unprofitable for grain crops, except as other and more rational methods may make them once more large and remunerative.

Fertility Regained.

There is practically no worn-out land in California; some of it may be weary; some of it is probably mad and rebellious over the treatment it has received during the last half-century. It is all capable of restoration to fertility and condition by rational farming, which includes tillage, rotations, fertilization and in some cases irrigation. All of these factors of more profitable farming are continually discussed on the pages of this journal, and each is emphasized in its bearings and accomplishments. Fundamental in fertilization is the animal industry, and it is also the key to practicable and profitable rotations. No matter how great good may be attained by the use of commercial fertilizers and by the growth of cover crops, such result is capable of indefinite extension by the wider prevalence of animal husbandry. We are not at the moment interested in the increased wealth to be easily reached in California by multiplication of animal products. We have frequently urged that and shall have more to do with it, frequently, also. What we would emphasize now is the fertility by-products of the animal industry in all its branches. These things are not sufficiently recognized in this State. The prominent man still lives who said in his youth: "California soils are not advantaged by manure; the climate insures continuous fertility." This old fallacy is less insistent than formerly, but it still persists; it is a dangerous half-truth. And yet our market gardeners return from the towns with their huge wagons filled with the products of city stables, while, chiefly, at the south, whole trainloads thereof go out from the towns to the fruit districts. In all our more progressive fruit districts, the local by-products from dairy corrals have an established value per cubic yard, and they are often mistakenly sold for distant orchards when they could be more profitably used on local forage fields. Thus we are beginning to recognize in a small way the general fact that the production of animal manure is really the key to increased fertility of lands which we are using for all other crops, and that the restoration of loaminess, with all its attendant phases of soil capacity and aetivity, is to be attained by the use of as much as possible of the land, not otherwise permanently planted, for the growing of live stock and of pasturage or field crops of forage and grains for their maintenance. Thus we shall get plant food at minimum cost; tillage most easily and with highest efficiency; moisture conservation to the very highest duty of water; glorious plant growth in a field, like that in a garden; yields many times greater than those now usual, and farming enterprises responsive and profitable, because farm animals are multiplied and their fertilizing by-products used freely and wisely, according to the conditions in a dry country, which require somewhat different practices from those prevailing in humid countries, where the present knowledge of the subject has been chiefly developed.

How Animals Feed the Land.

Readers who have not given much attention to the subject may think we are exaggerating the value and importance of animal manures in rational and responsive farm practice, and therefore overestimating their importance in the future development of California agriculture. Even those who have learned the elementary facts by experience and are now buying such materials by carloads from city wastes may not appreciate how great a total value is now available in California if it were properly conserved and wisely used. They will be interested to know that if the plant food now available in animal by-products of fertilizing character were bought at the prices which prevail in the trade in commercial fertilizer substances of the same nature, the total is surprising. To show the facts the following statement is prepared. It is based upon animals of medium size and average feeding, for both size of animal and character of feed influence the value of the manure in terms of plant food, viz.:

	Manure Value	Numbers in California	Total Manure Value
Horses	$26.00	503,000	$13,078,000
Cattle	26.65	541,000	14,527,650
Pigs	4.50	877,000	3,946,500
Sheep	2.40	2,500,000	6,000,000
Hens	.08	6,087,267	486,989
Total annual value of excrements			$38,039,139

This shows that the animals now kept in California, according to the latest reports of the United States Department of Agriculture, are producing a largely neglected by-product of surprising value. Just naturally and incidentally to their other activities and productions, these animals annually excrete a value which is nearly twice as great as the yearly gold product of California!

Such is the plant-food value of a by-product which we are now largely neglecting and wasting or unwisely using, and yet it is really the basis of soil conservation and restoration. Instead of being of less value here than elsewhere, it is perhaps even more valuable because of its relation to soil aeration, mellowness and moisture conservation. It can also be handled and used with a higher degree of efficiency and perhaps with less cost and danger of loss than in humid countries. As these considerations are realized and put into practical operation we shall have agricultural and horticultural production in all lines made more secure, enduring and profitable because the land is continually strengthened and improved; and therefore the claim that the extension of animal husbandry underlies the whole future development of California in farming lines is incontrovertible. It is a great truth for the upbuilding of the State: it is a great truth also for every individual land-owner who has his farming policy to decide upon.

Later we will discuss the other phase of stock-raising, also the financing problems suggested by the letter. More live stock, more fertility for the soil, with a constant supply of money to finance agricultural productions, mean much for California.

Queries and Replies.

Querists must give name and address.

Alfilaria or Filaree?

To the Editor: Please give a brief outline of the value of alfilaria in California, also its habits and soil and moisture requirements.—R. S. D., San Francisco.

Alfilaria or "filaree" (both names being corruptions or derivatives from the Spanish name of the plant, alfillerilla) is sometimes called pin-clover or pin-grass, but it is neither a clover nor a grass but a member of the geranium family. It is in California a very valuable, wild, winter-growing forage plant — generally grazed but occasionally cut for hay. It is an annual, starting with the fall rains, growing freely during the rainy period, making seed progressively while in growth, and dying with the drying of the soil early in the dry season. Its growth is directly proportional to the richness of the soil and the abundance of moisture, though it endures drouthy intervals in the rainy season well and is therefore entitled to drouth resistance, though it grows little during the California dry season except on low, moist ground. It must be sown each year either naturally or by seeding—actually it is almost entirely self-sown. It is a good wild feed during the growing season and its remains are a factor in the naturally-cured hay or what is called "dry feed" in this State. From California the plant has been distributed widely southeast through Arizona and beyond, where winter temperatures are not too low for its endurance. It is not a plant for "wintry" climates.

Walnut Erinose.

To the Editor: I am sending you a diseased English walnut leaf. I wish you would tell me what is the trouble and the remedy, through the columns of your Pacific Rural Press. The leaves have only got this way in the last year or two, and this year the walnuts are dropping off. The leaves are pretty much the same all over the tree.—F. F., Blocksburg.

The manifest trouble with the leaf sent is walnut erinose—rough patches of the leaf surface caused by a microscopic mite. This is an old trouble which seldom occurs widely enough to require treatment, which would be a thorough sulphuring as soon as you see the first sign of it. We never saw it abundant enough to cause dropping of the nuts, which is probably due to some other cause. Why did you not send also a nut which had dropped?

Apples on Pear.

To the Editor: When I read the article in the Pacific Rural Press of May 29, '15, "No Apples on Pears Nor Vice Versa," I was surprised. I am glad that I acted before reading that article. I have a Bartlett pear tree with five varieties of apples grafted into it. One graft that I put in, in 1913, matured two apples in 1914; one weighed 18 ounces and the other 15 ounces. There are three varieties of apples on the tree at the present time. I did not ask anybody about it. I thought that pyrus on pyrus was all right. We used the last of our apples in Jan., 1915. How is that for durable affinity?—W. H. L., Corning.

Thank you, but don't whistle too loud: you are not yet out of the woods. Two years does not constitute "durable affinity," but we hope you will demonstrate it. There are many exceptions to a rule of botanical relationships in grafting. Please tell us more about it, bye and bye.

New Cover Crops Prove Valuable.

[Written for Pacific Rural Press.]

"Only 40 per cent of the citrus orchards of the State grow any cover crop and only one-half of these are leguminous," says Dean H. J. Webber of the Riverside Experiment Station. Yet the primary feature in the control of mottle leaf seems shown by the experiments carried on at the the Station to be a need of organic material. And certainly the cheapest source of nitrogen and humus, as well as the best agent in opening the soil to water, air, and bacteria is a legume cover crop.

On March 4, W. M. Mertz, who has charge of the cover crop experiments at the Station, cut representative sections of the different crops, grown on the test plots to show their relative value. Purple vetch yielded at the rate of over twenty tons green per acre, having grown so thick that mallow was the only weed which could grow through. Lamb's quarter, or pig weed, which overshadows common vetch, could not get through the purple vetch. In the bur clover plots, beside the vetch, the weeds were pretty bad, while the Canada field peas and rye were a failure this year on account of the aphids and wire worms.

CROP YIELDS PER ACRE AFTER WINTER COVER CROPS.
[Arranged by W. M. Mertz, Riverside Experiment Station, Dec., 1914.]

Cover crop yields Mar. 4, '15. Tons (including weeds)	Percent weeds in cover crop	Average yield cover crops for 5 yrs. Tons	Variety green manure and fertilizer.	5 year average corn yields. †Failure due to poor germination and severe attack of aphis while crop was young.

The effects of various cover crops on yields of annual crops grown after plowing under the winter growth of the covers, is shown in the accompanying table, arranged by Mr. Mertz. The test was made in the open on annual crops, according to C. S. Milliken of the Station, on account of quicker results and greater convenience in measuring them. The tonnage would probably be different if these cover crops were grown in orchards, but the test shows their relative value under conditions as similar as possible. According to Mr. Milliken, the value of a cover crop depends on the tonnage of organic matter produced, and not on the number or size of the root nodules, which are simply factories in which the bacteria work, to fix the nitrogen of the soil air into the plant tissues. Perhaps the bigger the factory, the bigger the output, but the output is the final measuring of value.

Nitrogen Value of Legumes.—While Mr. Mertz agrees that legume roots, including the nodules, analyze less percentage of nitrogen than the tops, when nearing maturity, he goes a step further in locating the value of different legumes. By his measure, the tonnage of nitrogen fixed in plant tissues is the factor that determines a legume's relative value, in cases of equal tonnage, and equal growth in the growing season available. For instance, melilotus yielding sixteen tons per acre produced 144 pounds of nitrogen, while rye with fourteen or fifteen tons per acre produced only forty pounds of nitrogen. It is reasonable to suppose that the forty pounds of nitrogen in the rye plants came from the ground, since no means are known by which rye may fix atmospheric nitrogen. Mr. Mertz figures that it is also reasonable that the melilotus would not draw any more nitrogen from the ground than the rye did, so that its extra 104 pounds of nitrogen must have been drawn from the soil air.

In decomposing the cover crop plants into humus and plant food, certain bacteria have perhaps. the leading part. But this type of bacteria must have nitrogen in order to support their activity. In making humus from rye, bacteria must draw more or less nitrogen from the soil; and this temporarily reduces the amount available for the economic crops growing at the time. Melilotus and probably all other legumes furnish within their own tissues all the nitrogen which the bacteria need for food while decomposing the cellulose into humus and plant food. Thus, no nitrogen is drawn from the soil in the process of decomposition; and all of the nitrogen fixed from the air by the legumes in their own tissues will later be available for the money crops. Moreover, legumes seem often to be of special benefit, while growing, to certain crops planted with them. Visitors to the Riverside Station saw ordinary oats growing among the purple vetch with such broad, heavy, dark green leaves and tremendous stalks that they would not believe it was oats, but thought it was vigorous young corn; and were not otherwise persuaded because it had not yet headed out. But on March 4 Mr. Milliken showed the writer indisputable evidence that they were oats by pulling out a head of one of the most advanced plants. The same effect is noticed on grain at the Limoneira Ranch.

The theory proposed by Mr. Mertz to account for this good effect of legumes on non-legumes growing beside them is that probably the non-legumes extract some plant food from the outer parts of the nodules where the dead bacteria are decomposing. Whether the effect is the same on orchard trees is yet to be determined, though Mr. Mertz points to a noticeably good color on citrus trees in orchards planted to legume crops, and a yellowing of citrus trees where grain cover crops were growing.

Looking over the table, it will be noticed that in the five-year average of the different cover crops, purple vetch without additional fertilizer was followed by a heavier crop than rye even when 1188 pounds of blood had also been added. The purple vetch gave 54.3 per cent average increase for the four crops, while the expensive rye-blood application gave only 52.4 per cent. A still greater increased crop followed the tangier peas, though they yielded a lighter tonnage than the purple vetch. The highest increase of crop followed melilotus, which has still less tonnage than the tangier peas. Perhaps this extra good effect was due to the higher nitrogen content of the melilotus, or to its deep root which acts as an ideal subsoiler.

Seed for the purple vetch was very scarce last year, since this plant has only recently been introduced by the Department of Agriculture, and practically none will be available next year. Most of it was grown in Oregon last season, but there were scattered plots of the purple vetch all over the South this year. The Limoneira and Sespe ranches had some hundreds of acres, but the Limoneira people, at least, did not save any for seed and will have to use melilotus next year. Purple vetch plants in an orchard in Santa Paula canyon were observed by the writer where they had gotten into the limbs and climbed seven feet tall. This crop has been very successful wherever tried. The melilotus has been more generally planted, especially around Santa Ana, where the finest stand observed by Mr. Mertz was found; and around Redlands and Colton, where several hundred acres have been planted in various orchards. Even in the gravel near Upland, melilotus may be a great cover crop, as noted in another article.

EARLY BEAUTY PLUM.

To the Editor: Answering your inquiry, we have fruited the Beauty plum now for three years. They ripen two weeks in advance of the Climax; are of a similar shape; will average about seventy-five per cent the size of the Climax and are very nearly the same, though not as firm texture. **The Silva-Bergtholdt Co.**
Newcastle.

State Commission Markets

(Continued from page 25.)

yes, you say you have laws prohibiting a person destroying food; but the facts are there. It is very easy to allow fish to be out in the sun for a few hours and to be spoiled, and then, of course, it is thrown into the bay.

"It happens that my father is one of the commissioners at Agnews Asylum. They use a great deal of fish there. It is very valuable food for the patients—and hundreds of patients are there, kept at your expense as taxpayers of this state. Repeatedly has he gone to the fishermen of Santa Cruz and stated to them, 'We would like to have a bid from you to buy fish direct for the patients of Agnews.' They said they would be delighted to have the opportunity to render a bid. Did they do so? They have never even sent in a bid. And, I believe, they do not dare. The fish trust of San Francisco would cut them off. They have to send that fish up to San Francisco, and then it has got to go back to the State Asylum at Agnews, and at a fancy price. These are the conditions in this state that those who are working for the best interests of this state, must bear in mind.

"There is one thing particularly in this proposition that I wish to emphasize, and that is the information bureau. This bureau is to send out bulletins regularly; it is to tell the farmer where to send his goods, where they can go to prevent a glut on the market, at any particular spot at any particular time. The market director is to give them instructions as to how to pack their goods so that they will be salable. He is to give them all such information which the private commission man has not the time or the patience or the equipment to provide. I believe that this one feature of the State Commission Market is enough to justify the passage of this bill. Many of the people of my county are small farmers. They have little home places tucked away in the Santa Cruz mountains—a few acres where they raise a little of this and a little of that. They are not in the class which ships goods in great quantities for a foreign market. Those small farmers are the people that I am interested in particularly, and there are such people all over the state. I do not claim that this state market is going to handle all the business or the large business; but I claim that those people are not in a condition really to protect themselves. They are at the mercy of the private commission men. They are a class of people who have no say whatever as to what their product shall sell for. They must simply send it to the market and trust to Providence that they will get a price that will compensate them; but no matter what the return is, no matter what their product's disposition is, no matter what the result is, they must accept it. There are unscrupulous men in the commission business, as we will all agree there are in every position, and they send reports to these farmers as to the disposition, that there was so much spoiled, so many eggs broken, and this and that; yet often when a farmer is doing business on a big enough scale to go and investigate he finds the reported conditions are not true. I have tried to do something in the interest of those who are small producers, who are not in a position to fight the sharp commission men who sometimes exploit them."

PURPLE VETCH SEED SCARCE.

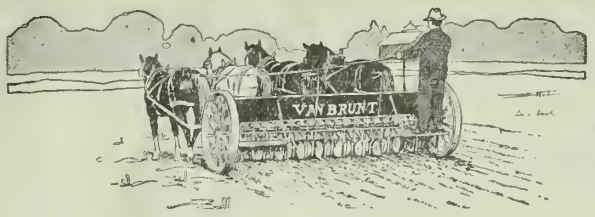
[Written for Pacific Rural Press.]

Purple vetch, the cover crop which has proved of such immense advantage over most all other legumes for winter growth in the orchard, will not be planted to any extent this year in California because the Oregon crop from which most of the seed is obtained, is a failure.

The Fruit Growers' Supply Company, the buying corporation for the California Fruit Growers' Exchange, had contracts with Oregon growers, but the contracts had to be cancelled.

The Limoneira Ranch, which had some hundreds of acres of purple vetch growing this year, saved very little seed and will sow melilotus next fall, though the purple vetch is preferred.

NON-BEARING PEACH TREES.



To the Editor: I was much interested in the article by Miss French in the Pacific Rural Press of May 29 about pruning to promote bearing of apple trees. I think this is a most important matter and would like to see discussion of the principles as applied to peach trees. The Southern California Canning Co. at Ontario has a hundred acres of peaches, and although 8 years old some part of the Tuscan clings do not bear as much fruit as they did at 4 years. The trees were thought to be making such excessive growth that they were cut back severely and now many of them just go right away and make wood growth year after year. The part that fruited lightest last year is so again this and the growth is so coarse that it is sure all wood again.

This condition appears to apply to so many kinds of fruits. I remember the company that I was with in England had some Black Currants infested with a mite that ate out all the fruit buds. They pruned and burned so severely that I do believe they reduced the mite to a negligible quantity, but although the bushes looked extremely thrifty they had lost the fruit bearing habit and were eventually pulled up and destroyed and the company went out of black currant production because they did not know how and when to prune to produce fruit. Strawberry beds respond in some manner if plowed and harrowed excessively at wrong time, making all leaf and little fruit, and the owner plows them up saying they don't do well on this land or, in a common expression, the land has got tired of them.

Ontario. HARRY WARD.

[It is largely guesswork to comment without sight of the trees and more knowledge of the conditions under which they are growing. The peach is the best tree we have to produce both fruit and make heavy wood growth, and therefore, ordinarily, one can heavily winter-prune and still get fruit. Still, if the bearing is shy one has to apply the general principle that summer pruning, late enough so that a new break of laterals is not made, will have the effect of making fruit buds more likely to develop strongly and at the same time take away from the roots some of the returning sap which forces them to make so much wood the following year. The same effect is produced, in a less degree, by stopping the winter pruning. Evidently if the Tuscans were very heavily cut back in winter to improve bearing, they were given exactly the wrong treatment to accomplish that end. They should have been summer-pruned or not pruned at all. If they had been heavily manured, that too should have been stopped and, if they had been over-irrigated, that should have been reduced. It is quite easy to make black currants unfruitful by too much manuring or winter pruning, and strawberries too generously treated are well known to run to leaves.—Editors.]

John Deere Implements

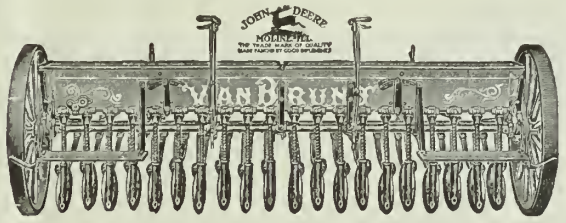
Van Brunt Single Disc Grain Drills

Van Brunt Drills plant any small seed from alfalfa to bearded oats, corn and peas exactly where it will bring the best results—at the bottom of furrows of uniform depth. All the grain is up and ready for harvest at the same time.

No seed is wasted, all the field sown. Van Brunt Drills have an adjustable gate force feed which compels an even, continuous flow of seed from each seed cup without bunching or cracking the seed. It cannot choke up.

The seed is planted at uniform depth. It beats the dirt. Individually adjustable pressure springs can be made to force discs to cut furrows even depth. Seed is conducted from hopper to furrow opener by metal tubes and there protected from dirt until it reaches bottom of furrow.

The "Light Draft Drills"



Van Brunt Drills are so called because they are light weight, well balanced and yet so strong that they work entirely satisfactorily under difficult conditions.

No stub axles are used—none required. Simplified construction makes Van Brunt Drills easier to operate.

Main axles are continuous. Drills are gear driven direct from axle. Each wheel drives half the feeds, insuring smooth running.

Hopper is extra large, well braced and has tight fitting two-piece covers. It does not sag.

Disc bearings guaranteed. They will last lifetime of

drill. Disc blades are high grade steel kept absolutely clean by spring steel scrapers.

Grass seeder attachment can be furnished for any Van Brunt Drill. It will sow broadcast or drill, as desired.

Write for free booklet "John Deere-Van Brunt Single Disc Drills." It explains why you will get the biggest yield by using Van Brunt Drills.

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X - 152.

HOLES IN BED ROCK.

To the Editor: Will fruit trees that have been planted where the bed rock is close to the surface, die in a year or so? We planted some young trees, blasted the bed rock and they look good, but have been told that eventually they will die because of water collecting about the roots in wet weather. Is this so?—E. J. H., Modesto.

[Unless you have some way for the water which collects in the holes you have blasted in the rock to drain away, your trees will surely die unless they can find enough soil above the bedrock to support roots enough to support the tree growth. Water in the holes will get stagnant and rot the rootlets in it, perhaps injuring the tree as well.—Editors.]

A plant for the manufacture of inferior walnuts into by-products will be opened within a few months in Los Angeles, according to C. Thorpe, manager of the California Walnut Growers' Association.

Apple Growing Costs About 25 Cents.

[Written for Pacific Rural Press.]

Chas. King's expenses raising an average crop of 5,000 boxes of apples in Sonoma county are about $1300. This would be about the same with a crop of 6,000 or 4,000, for some of the trees, especially the Wagners, are alternate bearers, this variety having as many as 1200 boxes one year and as few as 100 another in spite of thinning done with a view to overcome the trouble.

He has 8½ acres of Gravensteins, 7½ Newtons, about 3 of Wagners, Spitzenburgs, and Bellflowers. The Newtowns are 20 to 40 years old and the others range from one to 40 years.

Of the $1300, about $70 is spent for winter pruning. The plowing about April 1 is done with his own team in about eight days. A man is hired at $2 per day. A team and man ten hours per day would cost about $5. The orchard is cultivated eight to twelve times per season until the tree props are in the way, requiring one and a half days for each. This if hired would cost about $40 for plowing and $75 for the cultivations.

Spray Schedule.—In February when the leaf buds are nearly ready to burst, the whole orchard is sprayed in two days with a Bean Giant Duplex power sprayer, using about 3,000 gallons of lime-sulphur for San Jose scale. Mr. King is determined to do a good job and so insists on 200 to 225 pounds pressure at the pump, though some people think that this destroys some of the fruit.

"If so," says Mr. King, "it only amounts to a good thinning even in the calyx cup spraying, and no damage is doue after the fruit sets."

The lime-sulphur spray is applied as late as possible to get some of the aphis, too; but if the flower buds are out, the lime-sulphur at winter strength would kill the fruit to a certain extent. This application costs $75 for labor and material.

To prevent scab and mildew, the Newtowns are sprayed with 1200 gallons of Bordeaux at a cost of $15 for labor and material just as the pink shows. The other varieties are too tender, according to Mr. King, for the Bordeaux spray; so he uses 12 pounds of atomic sulphur per 100 gallons to spray them at this time, at a cost of $14 for material and labor.

When three-fourths of the petals are fallen, a combined spray for codling moth, scab, and mildew is applied. Six pounds arsenate of lead, ten pounds of atomic sulphur per 100 gallons of water are used at a cost of $42. Ten days later, another spray is applied with the arsenate reduced to 4 pounds and the sulphur to 6 pounds in the same amount of water, costing $29. About July 1 a 3-pound arsenate spray is applied, for $10.75. This is the last one that the Gravensteins get unless they are especially late. Last year they were off August 10, but some times they hang till September 1. About August 1 a 2-pound arsenate spray is applied to the late varieties to catch the late broods of codling moth, at a cost of $4.50.

Fertilization.—The whole ranch is supposed to be manured every two years with eight carloads of about 40 ton each on an average. This is brought from San Francisco at 60 cents a ton plus 85 cents for freight and 30 cents for hauling up from Sebastopol, making the total cost per ton $1.75. A little commercial fertilizer is used and part of the ranch was limed at the rate of one ton per acre, costing $7.50 per ton delivered at the ranch. There was some rye cover crop, but most of the orchard simply has volunteer weeds and bur clover. No effect of the lime or the rye has been noticed.

Picking.—Picking of the Gravensteins costs 8 cents per box because they must be handled most carefully and picked four times in order to get them when in best condition for shipment through the Sebastopol Apple Union. The Union furnishes the shook and paper, and packs the fruit at a cost of about 35 cents per box, not over $300 a year for Mr. King.

The other varieties are held in a cold storage plant on the farm, which was described in the Pacific Rural Press some months ago, and sold locally at greatly increased prices. These cost only 5 cents per box for picking and only one picking of the orchard is necesary.

The candidate for the position of locomotive fireman had studied the impressive figures, showing the aggregate loss of the company each year resulting from waste of coal and oil. The first question put to him was what he would do if he found his freight train confronted by an oncoming passenger train. He hesitated only a moment, then replied: "I'd grab a lump of coal in one hand, the oil-can in the other, and jump for my life."

A bumper wheat crop is reported being harvested in Kansas.

Pioneer Roofing

Made in California to suit California conditions. Pioneer Roofing is used all over the West and in several foreign countries, on account of its durability, long life, good appearance — and low price.

Resulphuring Dried Fruit

"The trouble with the dried fruit consumption of this country I believe is due to the miserable practice of resulphuring done by the dried fruit packers, very largely, as I believe, for the purpose of increasing the weight 10 to 15 per cent. A freshly cut peach sulphured as is common before drying, is not hurt by the sulphuring at all, since any of the sulphurous acid which may be left on the peaches is thoroughly evaporated during the days in which the fruit lies in the sun," says a marketer of many years' experience. "But now comes along the packer and buys fruit which may or may not have been overdried through unskillful management. He buys the peaches in bulk and when he prepares to pack them in boxes for market he steams them until they have taken up a great deal more moisture than is necessary to make them pack nicely. Ten per cent moisture increase on a 40,000-ton crop would be 4,000 tons which easily may prove a very "big stick" in the hands of packers to knock down the prices of the next crop, for that much extra holdover would be bad.

"But this is not all of the miserableness of the practice. The steamed peaches would not keep in that condition, nor would they be attractive to the consumers. Hence the packers resulphur them, and this time the sulphurous acid penetrates to every cell of the fruit. It makes a product which you can eat once or twice, but if you eat it very steadily, it will eat the insides out of you. This is the reason why dried peaches are not more in demand. They are simply "embalmed" with sulphurous acid to make them keep with the excess of water, and to give the cheapest grade of bulk peaches, formerly known everywhere as China peaches, an appearance which makes them salable in the higher grades. The "embalming" spoils the sweet taste of the dried fruit as it comes from the grower, and makes it sour to an extent that limits its use."

[On the other hand, a packer of dried fruit for a growers' organization, who has many years' experience both independently and in his present position in packing and marketing dried fruit, maintains that no injury can possibly come to the digestive apparatus from any sulphurous acid retained in resulphured peaches after they have been cooked. He points out that without resulphuring, the dried fruit demand surely would be practically nothing; for nobody would buy the peaches if packed as they ordinarily come from the farm. It is necessary to soften them with water or steam to pack them, though some packers overdo the thing. It is necessary to resulphur them both for the color which will make them marketable, and to kill whatever moth eggs may be in them. Many times when a box of dried fruit is opened, a few worms will be found, having crawled as near the small cracks in the box as possible. This, of course, kills the sale of the dried fruit and must be prevented. The fact that growers keep dried peaches in bins until the next season without resulphuring is due to the worms pupating and later flying away as moths without having done noticeable damage to the fruit. If they were confined in packed boxes so that succeeding generations of worms had to get their living out of the fruit, it would shortly be ruined.]

BUDDING-OVER PEACH TREES.

To the Editor: Last fall I had a lot of peach trees budded. The trees were four years old on a heavy clay soil; strong and vigorous. The bark slipped fairly well when the buds were set. I took great care in selecting the buds from thrifty trees known to be heavy bearers. The limbs used for budding were from ½ inch to ¾ in diameter. The appearance of the buds after setting was that a large number were taking hold, but when spring came not over one per cent was living and the cut where the bud was set was black and gummy. I now believe the whole trouble was in the tying. I have done considerable budding and they were not tied as I would have done, but I accepted the job and took the consequences. I know of no other reason for failure. I think I will try it again at once.

A Fresno man who claims to be "experienced" told me he'd been successful in working peach trees over by cutting off the old wood and budding the sprout when it was of the right size.—J. C. G., Modesto.

[The best time to bud peaches in the old bark is as soon in the summer as you can get well plumped buds on the new growth and this can be hastened by pinching the tips of the shoots you desire to take buds from. Such buds should be forced to grow by cross cuts in the stock above the buds or by breaking down part of it—cutting away cleanly when the bud has made a few inches of growth. We never tried to bud in the old bark in the fall with the idea of holding over. Cutting back and budding in sprouts is a good way.—Editors.]

CULTIVATE AFTER EACH IRRIGATION.

To the Editor: Is it a good idea to give a peach orchard two irrigations a few weeks between and without plowing or cultivating in the meantime, but water again in same furrows and thus save work? Or is it harmful to the trees to leave the soil untouched between the irrigations? Our irrigation season is short—generally ends July 1, and sometimes sooner. Some make it a practice to water the orchard a little before the water goes out and let it lie. Then if the water is still in a few weeks later, irrigate again.—G. E. C., Dinuba.

[In all our inquiries of successful fruit growers and other irrigators, the point emphasized most emphatically is that cultivation should follow as soon after irrigation as possible. The reason for this is that without cultivation the ground bakes and dries out, wasting irrigation water when trees most need it and injuring the roots, both by getting hotter deep down and by hardening the ground and rupturing the rootlets.—Editors.]

Mechanical Power on the Farm.

SMALL POWER, MUCH IRRIGATION.

[Written for Pacific Rural Press.]

Irrigating 10 acres of olives, oranges, and peaches in Tehama county with a 3 h.p. motor was made possible for R. L. Fuller by the use of underground pipes and a dozen hydrants. Three of these hydrants were on high points far distant from the well, but the water was forced thither very easily. The well is 140 feet deep and the pump has a 3-inch discharge, forcing the water to whatever section of the place Mr. Fuller wanted to cultivate a few days later. There is no loss of water on the way and no seepage which would prevent cultivation between the well and the farthest high point on the place. The hydrants enabled him to use a large or small stream of water as desired and to shut it off, just when enough had run onto the land.

TRACTOR AND SUBSOILER.

[Written for Pacific Rural Press by Lee Wolfe, Foreman for Boynton Bros., San Jose.]

Answering your inquiry relative to our tractor: We use it for everything practically—plowing, working down, cultivation, subsoiling, etc. Last summer when the fruit rush came, our horses began to give out in the hot weather and extra work. We turned to the tractor; coupled up two wagons and found the combination quicker, easier, and more efficient. It is this same story with all our orchard work.

Perhaps it would be of interest to mention one tool which we have built and found highly satisfactory for subsoiling and irrigation furrows. By mounting a right and left hand mold-board oppositely on a subsoiler we have a very neat little ditcher, which we pull to a depth of twelve or fourteen inches. We run three ditches between each row and get an excellent spring irrigation. We are able to raise a cover crop and let it grow until it is in the best shape to plow in as fertilizer. The tractor and heavy plow puts any growth under the ground in good shape and quickly. The ability to get the work done when the ground is in the right condition is a big factor as it makes better ground to work on, better trees, and best of all, better fruit.

Minimizing Trouble.—To get back to tractors, however, operating expenses are almost nominal you might say. We do the work of ten or twelve horses with two gallons of distillate per hour and use perhaps a quart of motor oil and a little cup grease a day. As to trouble, repairs, break-downs and such they come, certainly. We have those things in all kinds of machinery and expect them. The big secret in minimizing tractor trouble, judging from all our experience and observation, is never to overload your machine and to run slow. Failure to observe these two points will bring grief every time to any tractor. Your automobile will run fifty miles an hour, yet you wouldn't think of running it at that speed ten hours a day. A tractor has a right and demands just as much consideration. If it is rated 15 h.p. give it a 12 h.p. load, and work it longer if necessary, rather than give it an 18 h.p. load, which it will handle perhaps.

HANDSTICKS FOR POWER.

[Written for Pacific Rural Press.]

Whenever one has a rope and needs to lift or pull something much heavier than himself, and horses are not available, a Spanish windlass in the rope gives a tremendous mechanical advantage.

The apparatus is simply two round sticks of tough wood, perhaps two inches in diameter and about four feet long. The rope is left slightly slack but tied to the thing to be moved and something else which is immovable. One of the sticks is twisted into the center of the rope where there is plenty of room to work it around. It is then twisted around lengthwise of the rope and the other stick put into the angle formed by the first stick and the rope, at right angles to the first stick.

The first stick is then revolved around the second one, thus winding the rope around the second stick by means of the leverage gained by use of the first stick. One man or two can exert enough power to move a very heavy weight in this way.

USE PULLEYS TO LIFT.

[Written for Pacific Rural Press.]

A much neglected source of power on the farm is the use of ropes and pulleys. Whenever much machinery is to be handled, stored, or repaired, there should be a place where a set of pulleys are already in place un-

Goulds Triplex Pump

der which the machinery may be hauled and the parts lifted by this source of power. If the pulleys are run on a track like a hay fork heavy pieces may be lifted and moved easily.

In general, a ¾-inch rope running twice through a double pulley hung to the rafters of a shed, and once through a single "movable" pulley whose hook is hitched onto the machinery to be lifted, is enough for ordinary farm use.

Such a rope single would hold the weight of about a ton if it is new and made of Manila hemp. When run through the pulleys, there are four strands of this rope on which the weight of the machinery rests, and consequently as much as 8000 pounds could be lifted with a ¾-inch rope. It is well, however, not to work the rope to its full capacity, for when the limit is approached it is likely to be reached unexpectedly and something falls.

In lifting heavy articles with such a "double-single" set of "blocks," one must be sure that the building from which the pulleys hang is substantial enough to bear the weight and also the rope into which the upper pulley is hooped. For this, several turns are wrapped around the rafter and the pulley hook should not be run through the turn which runs into the knot.

In order to get extra power in lifting these heavy weights, a secondary or "luff block" is used, consisting of a similar or lighter set of pulleys and rope, the double block being hitched onto the long end where the pull would naturally be made, and the single block being hitched to a post somewhere convenient. This makes it possible for one man to lift a ton or so by pulling on the rope of the luff block.

PULVERIZER WITH OTHER TOOLS.

To the Editor: Answering your letter to the Paicines Ranch regarding the use of the "Cunningham" Pulverizer, we like the roller very well, but recognize its limitations. It takes practically no power to pull it and we operate it in conjunction with other tools. We had it supplied with a short pole and then fitted a swivel wheel under the pole. We can thus operate it with a tractor or horses. Four of the latter handle the 12-foot roller with ease, and there is no weight on necks nor jarring of shoulders.

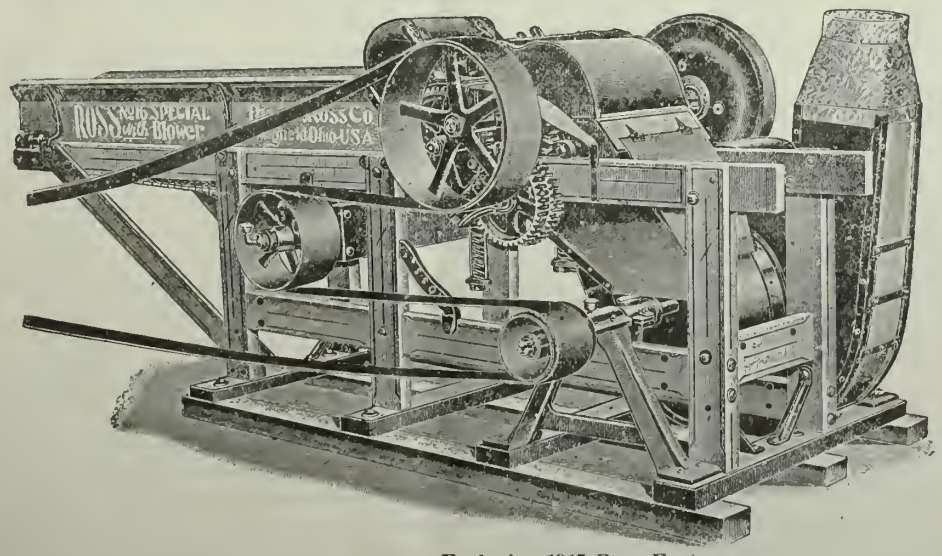
As a substitute for harrows, it is of no value, as an appreciable moisture in the soil causes it to clog badly. However, when used on a dry surface and alone or in front of other tools, such as the spring tooth harrow, it does satisfactory work. Its chief advantage lies in its ability to pulverize without packing the surface and that is our chief reason for choosing this pulverizer.

Paicines. Eric A. Dunipace.

FRESNO FAIR SEPT. 28 TO OCT. 2.

To the Editor: There will be the regular District Fair held at Fresno this year, Sept. 28 to Oct. 2. Although we are pulling strong in our community for the Exposition, at the same time we wish it known that we are not going to disappoint many exhibitors. In most every department we are adding to our premiums each year. This year in the cattle and dairy departments we are just doubling the premiums over those offered last year. We will have one new cattle barn to house one hundred more stock, and a new fireproof building containing 15,000 square feet of floor space for exhibits. In general we are improving our grounds as fast as funds will allow, with the aim of having as beautiful an agricultural park as there is to be found in the west.

C. G. Eberhart, Secretary.



California ranks third in the United States in the number of automobiles in use. New York is first, and Illinois second.

SECOND HAND PIPE
Very best quality of selected second-hand water pipe and standard screw casing pipe. For quality and low price you make no mistake when buying water pipe of the Weissbaum kind. Largest pipe works in the West.

Commercial Engines
We Know Just What You Want in an Engine
We have studied the requirements of irrigation in this western country and have built an engine that delivers the goods. An engine that is simple and does not require an expert to operate it—that pulls its full-rated horse-power ten hours a day and every day in the year, if necessary, at lowest possible fuel consumption. And we deliver this to you direct from factory at manufacturing cost plus one small profit. The Commercial line has an engine for every requirement. Don't buy until you have seen our Catalog 18-E. Write for it today.

Make Rain Keep Your Crop Growing

We manufacture sprinklers for almost any kind of irrigation Lawn, Park, Garden, Orchard or Field; specially for Alfalfa. This irrigation by sprinkler is suitable for any land, level, hillside, or sandy soil. The water is thrown high in the air and drops on the land as natural rain. The advantages of this system are great labor saving, economy of water, and it leaves the land free to cultivate. To accomplish this we designed such sprinklers as will cover the largest area with any given pressure at the same time properly distribute the water over the area irrigated. Of course you must have water pressure. With heavy pressure and one of our large type sprinklers you can irrigate one-half acre per unit. When writing it is absolutely necessary to give all details of water pressure and supply, also purposes intended for. We want to demonstrate this system. Address all communications to

H. E. J. VACHER,
Sprinkler Manufacturer,
19 W. Mason Street,
Santa Barbara, California

Spraying Time

and there is no better spray than

Scalefoe

Not only for scale but nearly all insects, worms and bugs that infest plant life. It has been killing them for 15 years, giving the greatest satisfaction without injury, but positive benefit, to the plant. Send for our circular of testimonials or better, try it.

Gallon can, 50c;
5-gal. can, freight prepaid, $2.00.

Must be mixed 20 parts water to one Scalefoe before using, making it very cheap. Write for prices in barrels delivered at your freight station.

TOMPKINS & CO., Proprietors. 116-118 E. 7th St. LOS ANGELES.

General Agricultural Review.

OLIVES AND NUTS.

The California Almond Growers' Exchange has 18 locals and 851 members, according to a report received on July 1.

That the standard of California walnuts will be raised is expected at the next meeting of the California Walnut Growers' Association.

Twenty-five per cent above normal is the estimate made of the Orange county walnut crop which is expected to be the largest in its history.

The Oakdale branch of the California Almond Growers' Exchange is reported to be showing rapid growth, it having thirty members at the present time.

That the walnut crop will be 12,500 tons, or the largest crop in the history of the industry, is the estimate made by C. Thorpe, manager of the California Walnut Growers' Association.

CITRUS AND SEMI-TROPICAL.

The San Fernando Fruit Growers' Association has shipped more cars of fruit this season than in any other season in years.

The Valencia crop of California is 2300 cars less than last season, and growers have received an average of $1 per box more than a year ago.

The Lindsay Valencia crop has practically all been sold, and it is expected that the price will average approximately $1.80 f. o. b. Lindsay.

Corona is to have the manufacturing plant of the newly organized Exchange By-Products Company, an association composed of lemon growers affiliated with the California Fruit Growers' Exchange.

The Mid-California Citrus Association of Tulare county met recently and elected the following officers: P. M. Schofield, president; Burt Cole, vice-president; H. F. Brey, treasurer; and F. L. Kennedy, secretary and manager.

The sale of 700 acres near Corona is reported to have been made by M. J. Monnette to the German-American Mortgage company. At the present time the land is in alfalfa and barley, but it is the intention of the new owners to plant it to lemons and subdivide the planted land.

It is reported that within two weeks, 213,000 boxes of Sicilian lemons were sold on the New York markets. Although the fruit from over the sea arrived in poor condition on account of the long journey it had, it supplied the market to the detriment of the home grown product.

The Zante Citrus Association of Tulare county has elected the following officers and directors: E. E. Graham, president; E. A. Marshall, vice-president; J. F. Canty, A. J. Davis, Wood Sandidge, S. S. Hough, and E. E. Jones, directors; E. C. Grant, secretary; and W. H. Grant, manager.

A meeting of exchange men was held in Lindsay on June 29, which was addressed by G. Harold Powell, general manager of the California Fruit Growers' Exchange; R. J. Grassly of Chicago, head of the advertising department; and D. W. Francisco, also of Chicago. "More push carts and more orange stands" were advocated by Mr. Powell, in urging the increased consumption of oranges, the ratio of which is increasing more rapidly than the population.

DECIDUOUS FRUIT.

The Ludwig fruit ranch of Shasta county, comprising 330 acres, has been sold by its owners to a San Francisco capitalist at a reported price of $200,000.

Work at the Armona plant of the Kings County Packing company is in full swing. There are three hundred employed there now canning 500 tons of apricots.

The prices on apricots in the Santa Clara valley during the past week were $25 per ton for shipping fruit, $22.50 to canners, $17.50 to dryers, and 7 cents per pound for dried apricots.

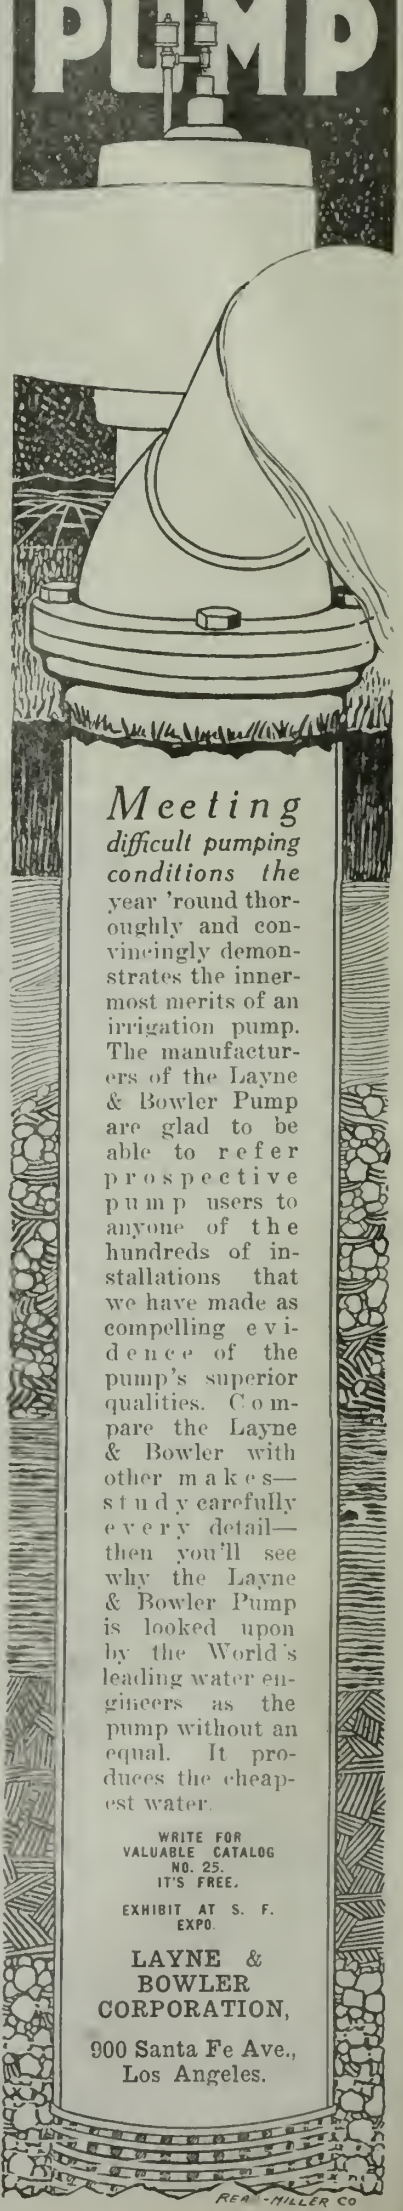
On account of unfavorable weather conditions during May, it is estimated that the apple crop of the Cohasset district of Butte county will not be over 10 per cent of a normal crop; fifty per cent of the plum crop is also ruined; and the prune crop hurt to some extent.

In order to keep the market stable and prevent the unloading of inferior stuff on it before the standardization bill recently passed becomes effective, the directors of the California Green Fruit Association have chosen a committee of four men to urge growers and packers to maintain certain standards.

Pooling this year's dried peaches and probably placing them in paraffine muslin sacks and storing them until favorable prices can be obtained, will be the result of an organization formed recently in the Fairview and Gray Colony school districts of Fresno county, where there is a big tonnage of peaches, very little of which has been contracted for.

An important step was taken recently by the apple growers of the Pajaro Valley in the organization of the Watsonville Fruit Distributors, a co-operative concern to handle the packing, shipping and marketing of the apples grown in that section. The same progressive spirit was shown in Aptos when articles of incorporation were filed by the Aptos Fruit Growers' Association, who will buy and sell orchards and fruit crops, and pack, can, and market fruit.

GRAPES AND SMALL FRUITS.



The shipments of Thompson seedless grapes from Imperial and Coachella valleys commenced last week. The crop will be larger than normal.

The plant of the Griffin & Skelley company at Sultana burned down on June 29. It contained 150 tons of raisins belonging to the Associated Raisin Company.

The prospects for a larger than normal output of table grapes from the Fresno section at this time are very good. While the bunches on the vines are not more numerous than usual, the berries are larger.

Last year San Joaquin county led all others in the State in the shipment of table grapes, sending out 3245¾ cars. Fresno was second, with 2768⅓ cars; Sacramento third, with 1400 cars; and Tulare fourth, shipping 799½ cars.

Layne & Bowler PUMP

Meeting difficult pumping conditions the year 'round thoroughly and convincingly demonstrates the innermost merits of an irrigation pump. The manufacturers of the Layne & Bowler Pump are glad to be able to refer prospective pump users to anyone of the hundreds of installations that we have made as compelling evidence of the pump's superior qualities. Compare the Layne & Bowler with other makes—study carefully every detail—then you'll see why the Layne & Bowler Pump is looked upon by the World's leading water engineers as the pump without an equal. It produces the cheapest water.

REA-MILLER CO

The Board of Directors of the California Grape Protective Association have made preliminary plans for the proposed circulation of petitions for an initiative constitutional amendment providing for compensation to grape growers and wine makers in the event of unfavorable legislation.

The California Associated Raisin Company is endeavoring to prevent growers from drying wine grapes this season, fearing that an inferior quality of grapes may be dried and thus spoil the market for the standard varieties. They are, therefore, seeking an arrangement with the wine men whereby all wine grapes which might be dried into inferior grapes will be made into wine.

GRAIN AND FIELD CROPS.

The planting of black eye beans is being done on the overflowed lands of the Mormon basin district of Colusa county.

A large head of water is pouring into the Tulare Lake bed, according to a report received, and farmers are rushing to harvest their threatened crops.

Brawley alone, of Imperial Valley, has shipped daily 100 to 150 cars of cantaloupes since the season began early in June, besides hundreds of cars of watermelons.

The experimental planting of two acres to rice in Shasta county has been reported. Its condition at the present time is said to promise a good crop, upon which depends future planting of rice in that county.

The record for daily shipments of cantaloupes from the Imperial valley was broken last week, when within a period of 24 hours 237 cars loaded with fruit was sent out. It is expected that about 4000 cars will leave the valley this season.

It is reported that 40,000 tons of hay, compressed by means of a hydraulic press to bales weighing 125 pounds, has been recently shipped from San Francisco to Australia. While the selling price is not known, the freight is said to have been $22.50 per ton.

An order has been placed in the Porterville district by W. H. Bloomingdale, reported to be an agent of the allies in Europe, for 15,000 tons of alfalfa hay to be delivered in bales of 80 cubic feet, shipped to Galveston, where it will be reshipped to Europe.

County Horticultural Commissioner G. W. Harney, of Yuba county, estimates the season's crop of rice at a valuation of $240,000. Mr. Harney has recommended to the Board of Supervisors the erection of a rice mill, stating that the extent of the industry in that section warrants the venture.

Scott, Magner and Miller of San Francisco write us as follows: "We report total arrivals of hay on the San Francisco market during the week ending today at 4350 tons. There has been very little life to the market situation as the demand for this article for local consumption has continued to remain decidedly moderate. There does not appear to be anything in the present outlook to lead one to expect improvement in our purely local demand for a while at least. Our hay markets during the last few months have been mainly maintained on account of our export activities through which channels large quantities of hay have been turned and thereby getting the surplus of the old crop out of the way and relieving the situation so that the new crop may come in on a better basis. Harvesting the hay crop is going on very satisfactorily and the quality of our wheat hay and our red oat hay looks most attractive. The feeling among the producers appears to be firmer on choice lots, although we do not believe that there has been much trading done during the week. Most of the hay arriving is of the old crop, very little of the new grain hay being ready as yet for shipment. There appears to be quite a volume of volunteer hay, but of such character that it is expected to be slow in moving under prevailing conditions. Alfalfa hay has been coming in in moderate quantities with the market set and fairly well maintained."

BARLEY ESTIMATES.

A sheet giving the statistics of production and crop movement of barley on the Pacific Coast has just been issued by the E. Clemens Horst Co. of San Francisco. It shows that the commercial estimate of the crop grown in California in 1914 was 861,000 tons against an average of 497,000 tons for the last 15 years; the carry-over from the previous year's crop in 1914 was 54,000, and for the last fifteen years, 46,000; the exports in excess of imports at all ports, 456,000; for the last fifteen years the average was 175,000; the home consumption in 1914 was 350,000, while the average was 321,000; the carry-over to the next crop year in 1914 was 109,000, the average being 47,000. In 1914 the average price for No. 1 feed barley in San Francisco per 100 pounds was $1.20, which was an average price. In 1914 the total exports from San Francisco to United Kingdom and Europe of tons of 2,000 pounds was 388,000, the average being 125,000.

MISCELLANEOUS.

A three-day district fair is to be held in Merced sometime in September.

Work on the Kings county highway will shortly commence, the money obtained from the sale of the bonds having been turned into the county treasury.

A new rate of 67½ cents per hundred pounds on canned goods in carload lots of 60,000 pounds minimum weight shipped by rail from Fresno and all other California points to points as far east as Chicago will take effect July 21.

The University of California has appointed Paul Dougherty to assist Farm Adviser Baade of Napa county in the performance of his duties, all the expenses of the assistant being paid by the University.

Foodstuffs valued at $724,000,000 were exported from the United States to foreign countries during the eleven months ending June 1. Wheat formed the biggest item in the products sent abroad.

The Turlock Merchants and Growers' corporation recently formed for the buying and selling of the crops in that district commenced operations on July 1. A call was made for 25 per cent of the subscribed $13,000 worth of stock. No sales manager has yet been appointed, the affairs of the corporation being carried on by the executive committee.

Over a year and a half ago, the War Department of the U. S. Gov. commenced a survey of the San Joaquin river to determine the feasibility of navigation as far up as Herndon. The expenses of the work have been incurred partly by the State and partly by the Federal Government. The task is about completed, and a report will be made within the next six months Should the report be favorable, construction work will be placed in the hands of the Rivers and Harbors Commission.

EXPOSITION EPITOMES.

Atwater is planning a district fair on September 18.

August 7 will be Sacramento Valley Day at the Fair.

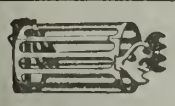
A meeting of the executive committee of the Pacific Coast Nurserymen's Association was held last week to arrange for the annual gathering at San Francisco next month.

A profit of 61,000 has been made by the Exposition from Feb. 20 to June 13, according to a report made to the Board of Directors by the Comptroller.

The following conventions will be of interest to grape growers: International Congress of Viticulture, July 12, six days; California Viticultural Exhibit Association, July 12, two days; State Board of Viticultural Commissioners, July 12.

The Universal Corn Convention and Corn Exposition will take place at the Panama-Pacific Exposition August 5 and 6. All interested in promoting the corn industry are invited to exhibit ten ears of any variety of purebred corn.

A "movie" which is attracting a great deal of attention in the Government theater of the Palace of Liberal Arts is one which picturizes the fire which raged last year through the forest and up to the very outskirts of the town of Sisson, California; and the destructive fire which broke out a few days later in the town and destroyed numerous buildings. These two films have been joined together and present a vivid picture of a forest fire from its start from a lighted match thrown on the ground by a careless hunter, its progress through the forest, its approach to the town, and finally the destruction of the town. The good work of the U. S. Forest Service fighting force is also shown.

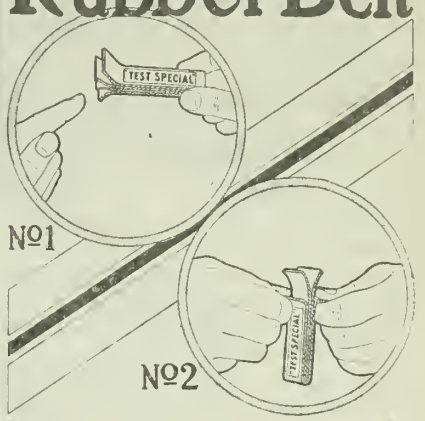


SULPHUR

Fleur de Soufre, Anchor Brand, Velvet Flowers of Sulphur and Eagle Brand. Packed in barrels and double sacks. Are the fluffiest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH. SEND FOR ILLUSTRATED BOOKLET; also PRICE LIST and SAMPLES.

SAN FRANCISCO SULPHUR CO.

624 California St., San Francisco, Cal.



IDEAL GOPHER TRAP

Only Trap guaranteed to catch large or small gopher. Being round with thin edges gopher walks into trap before detecting anything in runway. Positive grip, jaws always hold. 100% efficient—catches gopher every time. Easiest to set. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. Price 50c. If your dealer can't supply you, will be sent postpaid on receipt of 60c; two traps for $1.10; six for $3.00. Money back if not satisfied.

E. J. CHUBBUCK, Dept. B.

731 Market St., San Francisco, Cal.

The Standard Test for Rubber Belt

Ask your dealer to cut off two strips of belt one inch wide, one from Test Special and one from any other brand. Separate the plies with a knife as shown in Photo 1. Then endeavor to pull the plies apart as shown in Photo Number 2. If your dealer does not carry **Test Special,** secure a sample of what he has and send to us for Test Special sample.

Another Test for Rubber Belt

This time test the belt for flexibility. The grade of cotton duck used in a rubber belt is an important factor. For Power transmission the duck must be flexible, not hard or stiff.

Take the ends of two rolls of belt, one of them **TEST SPECIAL,** in your hands. Bend them back and forth. You can feel the difference.

TEST SPECIAL contains the best grade of cotton duck. The rubber which cements the plies together is pressed into every thread and fibre of the duck.

If your dealer does not carry **TEST SPECIAL,** advise us. We will tell you where to find the nearest stock.

WE WILL SOLVE YOUR PROBLEM.

We shall be glad to help you solve your transmission belt problems. Just write to us.

New York Belting and Packing Co.

Let us send you newest Booklet on Rubber Belt. It's Free—Write for It!

EUCALYPTUS SEEDS.

Forty species to select from. Write for free pamphlet "Eucalyptus Culture." It tells how to sow the seed, raise the young plants and plant out in the field. Trial packets 15c each. 4 for 50c. Special prices on large quantities.

THEODORE PAYNE,

345 S. MAIN STREET, LOS ANGELES, CAL.

SILAGE alone is an unsatisfactory feed because of its deficiency in nitrogen, and a steer placed on this ration is forced to draw on his stored nitrogen to meet the demands of the body for nitrogen. While the animal was eating all the silage its appetite would permit, there was every indication that it could have digested more silage if it could have consumed it. The appetite seems to act in some way as a check on the efficiency of the animal." These are conclusions drawn from a digestion experiment at the Georgia Expt. Sta. with a 14-months' Shorthorn steer.

Closing the Gap in Beef Operations.

[Written for Pacific Rural Press.]

Supplying their butcher shops with prime beef in the spring when good range cattle are scarce, has led Russ Bros. of Humboldt county to install feeding methods radically different from those in vogue elsewhere. For this purpose, the silo was first brought into play six years ago; and at present there are eight of them on their various ranches, six of which are used every year in the feeding out of 400 to 500 head of steers.

Oats, barley, peas, and volunteer grass crops are used for silage and are supplemented with three to five pounds of rolled barley daily and in some instances by alfalfa meal. Barley is deemed best in connection with silage, however, hy T. Lytle, manager of the ranch, because of its heating qualities, which are assets during the cold damp season when feeding is done.

At the main finishing plant near Beatrice, the stock is housed in large feeding sheds enclosed on all sides with lumber, the eattle not being allowed access to the corrals at all, but rather continually kept under shelter where they are fed in racks. This entirely overcomes much annoyance and promotes faster gains.

At the other plant near Ferndale, however, a different system of housing is used. In this case a large barn with open sheds on the side and outdoor corrals are used.

Twos coming three and threes coming four are principally used for finishing, the threes coming four being used when it is desirable to turn off quickly, as they put on fat while the twos coming three are most profitahle for longer feeding periods, as they put on considerable growth before fattening.

In this particular case, finishing in this manner would be practieable whether there was a spread in the market price or not as they need quality beef for their retail trade; but it is interesting to know that with the exception of last year's feeding, the spread of three to four cents per pound between the middle of November and March has heen amply sufficient to make the finishing profitable. Last winter's and spring's queer market cut down some on the profits, but still allowed a shade of profit; and being an unusual market situation, was considered entirely satisfactory.

Breeding as Well as Feeding.—It is probably unfair to give the silo all of the credit for the success of finishing on this ranch, breeding being the backbone of all such undertaking, and in this case being an outstanding feature. For 25 or 30 years, Shorthorn and Hereford bulls have been used exclusively on their ranges, a herd of 60 purebred Herefords being maintained at the home ranch, and in recent years that breed of sires has predominated on the ranges. Thus one finds the feeders more capable of putting on flesh in the feed lots than would be the case with the ordinary run of range cattle in that section.

Owning as they do many thousand acres of land, necessitates diversfication of livestock, the richer lowland and hill soils being more valuable for dairying purposes than for beef cattle. At one time the dairying on the ranch was much more extensive than at present, but ten large dairies are still being operated. Most of these are run on a percentage basis, but some few are rented to tenants.

Sheep Eradicate Tarweed.—Sheep have largely replaced the dairies on account of their ability to do well on land which has been too badly infested with weeds for the dairy cows. Several of the ranches which were formerly run as dairies and where tar weed had practically taken the soil, have been turned into sheep ranches, with the result that the tar weed has been entirely eradicated.

A comparatively small portion of the ranges has ever been seeded, rye and orchard grass sometimes being used on land recently cleared of brush. Foxtail and the natural grasses are of primary importance on the sheep ranches. Coyotes are somewhat of a menace to the sheep flocks, but are being successfully overcome by fencing.

Cotswold blood predominates in the range sheep with a sprinkling of Shropshire, but Cotswold are favored as they seem to withstand the wet winters better than either Merinos or Shropshires.

Spring Lambs.—The aim is to have lambing after the heavy winter rains in March or April, although the continual green grass makes it practicable to lamb later in the season most any time. A lamb born in March or April and run on the ranges weighs 60 to 70 pounds in August, thus showing a good profit for its owner.

A flock of purebred Cotswold ewes are maintained at the home ranch with which to supply bucks for the range.

It is seldom that one finds such a complete chain of interests as is represented by Russ Bos. They breed purebred sires for their utility flocks and herds, finish their eattle themselves for their butcher-shops where the retail price is secured. By securing producer's, middlemen's, and retailmen's profits, they surely get all there is out of their livestock and land interests.

Fifty head of two-year-old heifers were purchased by John Castro of Berkeley from Hayes & Devaney of Alameda county.

GENTLE BULLS SALABLE.

[Written for Pacific Rural Press.]

A dairyman who raises a number of purebred bulls every year, thus describes the care he takes of the herd sire.

"We clean and rub him and curry him down every morning and put on a blanket to keep off the flies. We keep him in a somewhat darkened stall through the daytime and turn him out at night into a small yard. He gets all the alfalfa hay he wants and 4 or 5 pounds a day of an equal mixture of bran, oats, and ground barley carefully mixed on a feed floor with a shovel. Corn is not fed because that tends to make a bull 'loggy'."

Such treatment makes even a bull brought in from other environment tolerably safe; and gentle treatment of growing stock on the Stanford Vina ranch made it possible for a Pacific Rural Press representative to walk around among a bunch of yearling bulls without scaring them or getting scared. This was pointed out as a great advantage in selling, because the buyer sees the bull is accustomed to handling. Rings are inserted in the noses at an early age, and after a few days in the barn to heal the wounds, the animals are led around gently by staff, learning that they must go as directed.

A carload of bulls were recently shipped to San Francisco by Siemsen Bros. of Napa county. This stock was purchased in Arizona and fattened on the ranges of Napa valley.

National Dairy Union Conference.

The directors of the National Dairy Union, and others interested in the development of the dairy industry in this country, met in Washington, D. C., the early part of June for the purpose of outlining some definite action relative to dairy legislation in the next Congress. The main object of the conference was to perfect the oleomargarine legislation that has been before Congress for several sessions.

A conference was held with the Internal Revenue Commissioner to consider the question of the rate of taxation which the bill should specify for oleomargarine. No definite decision was reached, but sentiment appeared to favor a one cent per pound tax.

After this conference the delegates met at the Bureau of Standards to see a demonstration of a device for measuring color, by the use of which it is planned to adopt a standard color for oleo. It developed that the previously suggested color standard, expressed in terms of percentage of white, would not be satisfactory, since by juggling colors the legal percentage of white could be complied with and the product still show a relatively high yellow color.

By the newly adopted basis of measuring color, which is expressed in terms of the ratio between the reflecting power of blue and yellow, the degree of yellow coloration can be controlled.

The main features of the new bill which were decided upon are as follows:

(1) The adoption of color standard for oleo, and the prohibition of its manufacture or sale under any conditions when the degree of yellow coloration is greater than that prescribed.

(2) The limiting of the amount of butter fat that may be incorporated in oleomargarine to 5 per cent.

(3) The adoption of a uniform tax rate for all oleomargarine.

The other features of the bill were left in the same shape as the National Dairy Union had prepared in a measure introduced in Congress nearly two years ago, known as the Haugen Bill.

The two plans of taxing oleomargarine (10 cents for colored and ¼ of a cent a pound for uncolored) has been the cause of much fraud practiced upon the Government, and has been used to create a false impression that all oleo was paying 10 cents a pound tax, when the great bulk of it is only paying ¼ of a cent tax. By prohibiting the coloring of oleomargarine, and a straight tax, the greater part of the deception and fraud will be stopped.

The Pennsylvania law, which prohibits the sale of margarine in imitation of yellow butter, proves the contention of the dairymen that uncolored oleomargarine sells for less money and is of a better grade than when colored, and does in no wise interfere with oleo honestly manufactured and sold for what it is.

A resolution was passed by the conference thanking the Internal Revenue Commissioner for his work in enforcing the present law.

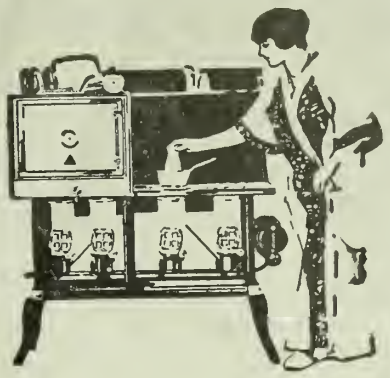
It is generally conceded that the time has arrived for oleo to be sold for what it is, and at the same time giving consumers a substitute for butter at a reasonable price, instead of paying excessive prices as has been the case too often in the past.

The probabilities are that oleo manufacturers who are anxious to sell their product on its merits at a reasonable profit will not oppose this measure.

Other matters discussed were the correct labeling of imitation evaporated milk products.

A WELL PLANNED PIGGERY.

[Written for Pacific Rural Press by Frank H. Wilson, Turlock.]



You may be interested in knowing how the hog pens and pastures are arranged at the Allison Ranch in Stanislaus county, where we are raising purebred Berkshire swine.

The whole piggery comprises about 18 acres. The farrowing pens are 100x150 feet and each contains a wallow of concrete, 6 feet square and 5 inches deep. It is covered by a shed which affords shade. A small trough built in at one side of the wallow contains fresh water from the dripping faucet. The water trough has bars across it so that the hog cannot lay down in it. The water spills over into the wallow. Every week the water is drained from the wallow through a pipe. A small permanent farrowing shed is located in each corner of the pen.

After the pigs are six or seven weeks old, they are turned, with their mother, into the weaning pasture where they soon learn to eat alfalfa and forage for themselves. The ration of one quart of crushed barley or Egyptian corn to one gallon of milk, more or less depending on the size of the litter, is gradually cut down until the sow and pigs are getting skim milk only. Then they are turned into the alfalfa pasture. It is arranged so that the pigs can get into the weanling pen through a small door. This door slides up and down and can be regulated to allow the weanlings into the pen. Here they are fed skim milk and barley or corn (we raise Egyptian corn mostly) until they are large enough to be fed without milk. This is given to all hogs in the pasture once a day.

As there are no trees in the alfalfa pasture, a large shed is built on the line fence and furnishes the required cool spot. The overflow from the artesian well runs through both pastures so fresh water is plentiful.

A long lane 2 feet wide leads to the dip tank. It has gates at 20 foot intervals. The hogs are called and led into this long lane, fed a little grain, and then those in each section are dipped one by one in the tank, which is 20 inches wide, 3 feet deep, and 10 feet long. With such tame hogs, one can dip a good many per hour.

Every Convenience of Gas

A good oil stove lights like gas, regulates like gas, cooks like gas. And it does away with the dirt, delay and waste heat of a wood or coal range.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Bakes, broils, roasts, toasts perfectly. Does everything your wood or coal range will do. No odor. Does not taint the food. Does not overheat the kitchen. Several styles and sizes. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

DAIRYING.

Dairies in Kings county have been found in very good condition by J. V. Canham, inspector of the State Dairy Bureau, who recently made a tour of inspection through the county.

A tract of 840 acres which will be developed into a model dairy farm was recently sold by the Oak Land & Water Co. of Tulare county to a bunch of southern California capitalists.

The Clarksburg Cow Testing Association, formed after the dissolution of the Woodland Cow Testing Association, is reported to be showing marked progress, 1100 cows being registered and under monthly test.

On account of lack of sufficient cream, the creamery recently established at Stonyford, Colusa county, has closed down. The farmers will ship their product to outside creameries until business picks up again.

A model dairy is to be installed at the Lemoore High School in connection with its agricultural department. Several cows will be secured and the students will be afforded the opportunity to study dairying under the most favorable conditions.

Nearly three million pounds of butter annually has been in the past imported to California from Australia and New Zealand; but the tables have been turned, for during the last three months California has shipped more than 1,000,000 pounds to the Antipodes.

On account of the growth of the dairy industry in Churchill valley, Nev., it has been found necessary to add new machinery and thus increase the capacity of the Churchill Creamery. Hereafter all butter manufactured at the creamery will be pasteurized.

Chas. Klint, official tester for the Gridley Cow Testing Association, reports that the best average production for herds of twenty cows was secured by John Guill, Jr., of Chico. His 24 cows averaged 981 pounds of milk and 34.1 pounds of butter fat each for the month.

Hereafter dairymen of Brown's Valley, Yuba county, will not have to haul their product a long distance to market or make their own butter, if the plan of Ruel Hendricks of that place is successful. It is his intention to establish a creamery with a capacity to handle the product of many cows.

One must advance with the times. We read the other day of a woman who in suing her husband for divorce charged him with cruelty because he forced her to help him milk his large herd of dairy cows. In his answer, he sadly reminded her of how in the halcyon days of love's young dream she had found such tasks a pleasure; in fact, the picture of her in gingham apron and sunbonnet, carrying milk pail and stool had first touched his manly heart. Why not buy a milking machine and let the hearth-fire still continue to burn?

From Malcolm H. Gardner, Supt. of Advanced Registry of the Holstein-Friesian Association comes the following announcement of breeders who have made official records up to April 30, the cows, and their records: A. W. Morris & Sons, Woodland; Full aged class, Pasma Burke 137644, 30 day test, milk 2436.8 pounds, butter 90.265 pounds; Charlotte Walker 2nd 139968, 30 days test, milk 2405.5, butter 82.990; Ignaro Creamcup 102569, seven day test, milk 500.7, butter 19.044; Josephine De Kol of Cedarside 140714, seven day test, milk 396.2, butter 18.892; in the junior four-year class, Lady Mead Salambo 183463, eight day test, milk, 502.3, butter 22.048; in the senior three-year class, Leda Gerben Alcartra 2d 170500, eight day test, milk 524.8, butter 22.765; Creamcup Contenta Pontiac 161994, six day test, milk 444.1, butter 19.517; in the senior two year class, Queen Pontiac Charlotte 197488, 30 day test, milk 1587.0, butter 61.888; in the junior two-year class, Leda Gerben Korndyke 199667, 30 day test, milk 1955.2, butter 63.754; Miss Luit Walker Burke 203266, 30 day test, milk 1627.5, butter 10.626; Margaret Terpstra Korndyke 197490, seven day test, milk 324.2, butter 8.548; Nutula Korndyke Fobes 206566, seven day test, milk 250.5, butter 8.318; semi-official yearly records, full aged cows, Arcula Alcartra 94912, yearly record milk 22675.2, butter 746.79; Nydia Creamcup 111907, yearly record, milk 21504.3, butter 741.08; Leda Hartog Tiettie Alcartra 112299, yearly record, milk 19778.4, butter 676.44; Aaggie Spring Brook Floa 104349, yearly record, milk 19439.4, butter 658.55; Wilhelmina Gerben De Kol 103374, yearly record, milk 17469.5, butter 633.26; We-no Alcartra 112292, yearly record, milk 19311.8, butter 622.84; Electa Ignaro 66558, yearly record, milk 19,155.0, butter 604.32; Leda Hengerveld De Kol 4th 123457, yearly record, milk 16373.9, butter 586.47; Mary King of Riverside 93943, yearly record, milk 14971.7, butter 581.78; senior four-year class, De Kol of Valley Mead 2d 127017, yearly record, milk 20326.4, butter 809.37; Miss Dutch 140723, yearly record, milk 16958.2, butter 602.60; junior four-year class, De Kol of Valley Mead 3d 163012, yearly record, milk 14574.9, butter 532.91; senior three-year class, Leda Josephine Korndyke De Kol 170252, yearly record, milk 14553.5, butter 524.43; junior three-year class, Creamcup Ruby Pontiac Burke 158127, yearly record, milk 16456.5, butter 594.94; Miss Sandes Burke 143868, yearly record, milk 16010.3, butter 490.61; Glista Flossie 149450, yearly record, milk 11501.0, butter 447.74; Astrea Johanna Pontiac 157931, yearly record, milk 11692.6, butter 399.57; senior two-year class, Aralia De Kol Mead 182592, yearly record, milk 16669.3, butter 696.49; Riverside Seely Girl 2d 182597, yearly record, milk 14115.8, butter 600.88; Creamcup Contenta Pontiac 161994, yearly record, milk 15722.6, butter 525.22; Aralia Mead De Kol 182593, yearly record, milk 11742.9, butter 515.54; Leda Korndyke De Kol 170498, yearly record, milk 14876.3, butter 500.85; Leda Gerben Alcartra 2d 170500, yearly record 15716.6, butter 496.88; Aaggie Netherland Juliana 182591, yearly record, milk 15475.9, butter 486.89; Helen Nye Skylark 184611, yearly record, milk 11757.1, butter 456.53; junior two-year class, Molly De Kol

MISCELLANEOUS.

OWING TO THE MANY requests of our customers to give them information as to where they can buy or sell dairy stock, we have established a livestock bureau in connection with our office. For anything in this line write us. V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

Mead 184614, yearly record, milk 16454.5, butter 546.54; Laura Netherland Skylark 184612, yearly record, milk 12657.4, butter 471.94; Lady Segis Douwe 184618, yearly record, milk 14176.4, butter 439.63; Jane Korndyke of Riverside 2d 195414, yearly record, milk 12696.6, butter 431.32; Jane Netherland Segis 195415, yearly record, milk 12781.4, butter 429.38; Lady Aralia Salambo 184617, yearly record, milk 11570.7, butter 529.02. The Whittier State School, Whittier; Full Aged Class, White Bess Clothilde De Vries 85947, 30 day test, milk 2223.5, butter 71.078; F. Stenzel, San Lorenzo, in the junior four-year class, Pauline Inka De Kol Kate 151749, eight day test, milk 485.6, butter 16.371.

CATTLE AND SHEEP.

Five yearling bucks weighing 800 pounds were recently shipped by J. R. Bloom of Dixon to a ranch in the Montezuma hills.

A thousand head of sheep were recently purchased by J. B. Agee of Napa from J. Z. Morrison and Jack Berry. These animals will be turned loose on the owner's tule land at the Balfour-Guthrie ranch near Soscol.

Jas. Gallagher, Jr., of Livermore, recently purchased 1300 breeding ewes from Louis Bordnave of Stockton. These will be pastured in San Joaquin county for the fall and summer.

All the sheep which have been in the Livermore mountains have been taken and put on pasture in the valley or the river bottoms of the Delta section. On account of abundant feed, the animals remained in the mountains one to two months longer this year than any season for the past twenty.

MISCELLANEOUS.

At the meeting of the Suisun Farm Bureau Unit on June 15, plans were started for the organization of a swine breeders' association and a fall colt show.

Armour & Company of Chicago, who were recently indicted by the Federal Grand Jury for violating the pure food law by the shipment of decomposed eggs, entered a plea of "not guilty."

An auction sale of cattle was recently held on the Clarence Topham ranch near Tulare. One cow brought $137.50, and the average selling price for a large herd was $73. Horses and young stock also brought good prices.

At the International Live Stock Exposition this year will be displayed the greatest fat stock and horse show that has ever been staged. A more novel display of animals will be made than has ever been made at the International, according to word received from Chicago.

Receipts at the Portland Union Stock Yards for the week ending June 29 were: Cattle, 1120; Hogs, 3660; and Sheep, 1887. The bulk of the steers went at $6.75 to $7.00; cows $6.00 to $6.25; and heifers, $6.00 to $6.50. The hog market was strong, the bulk going at $7.70 to $7.75, tops at $7.80. There was no change in the sheep market.

From Chicago comes the statement that a shortage of meat is inevitable, an advance of $1.00 and $1.50 per cwt. in fat cattle values since the low point of the year being conclusive evidence. Hogs are plentiful, but the production of mutton has been reduced in the last five years to such small proportions in the United States that a continuance of high prices is logical.

The National Dairy Show this year will consist of free demonstration work in feeds and feeding and handling for the benefit of those dairymen who are interested in the production of milk, cream, butter, and cheese without relation to the pure-bred side of the game. The show will be conducted along these lines on account of the delay over quarantine and also on account of the dairy and machinery show at the Exposition.

HORSES AND SWINE.

A carload of hogs was recently shipped to Los Angeles by the C. D. Campbell company of Tulare.

Scott S. Southworth of Napa reports the sale of ten Duroc-Jersey gilts and four boars to various parties in the State.

An imported Percheron stallion, Koloh 92334, was recently purchased by Max Berlin, John Meyn, and Otto Schultz of Livermore from the Dunham-McLaughlin Company of Oakland.

One hundred and fifty mules were recently purchased in Butte, Colusa, and Glenn counties by a government agent to be shipped to the Philippine Islands for use in the pack service there.

Two hundred horses were recently shipped from Yolo county to St. Louis, the assembling place for horses which are being bought all over the middle west and Coast regions, whence they will be shipped to England.

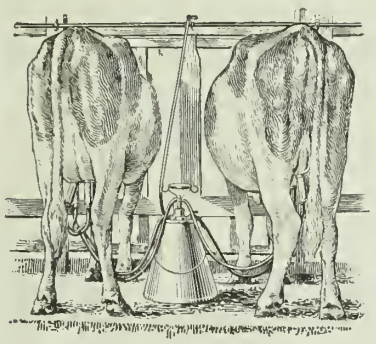
A demonstration and lecture on hog cholera was recently held by Dr. Bert Cady of the U. S. Dept. Agr. on the ranch of R. Renshaw, near Atwater. It was attended by many hog raisers of the vicinity who are working for the suppression of the disease.

The champion sow of the 1914 State Fair belonging to Wm. Bernstein of Hanford, recently farrowed a dozen pigs, sired by "Kings Wonder," also a State Fair champion. These pigs, together with their dam and sire, and several other animals, will be exhibited by Mr. Bernstein at the Exposition, the judging of which will take place Nov. 3 to 16.

CALIFORNIA QUARANTINE LIFTED.

A proclamation just issued by Governor Johnson lifts the foot and mouth disease on a number of States from which shipments have been prohibited for some time. All classes of livestock may now be admitted from Arizona, Colorado, Idaho, Nevada, Nebraska, North Dakota, New Mexico, Oregon, South Dakota, Utah, Washington and Wyoming, provided said livestock is accompanied by a certificate of inspection from a duly authorized Federal or State veterinarian. Dairy cows and bulls shipped in from the above States must also be accompanied by a satisfactory tuberculin test. When stock shipped from the above States is for immediate slaughter inspection is unnecessary. On permission from the State Veterinarian livestock may be brought into the State from Delaware, Iowa, Indiana, Kansas, Michigan, Minnesota, Missouri, Montana or Tennessee. Shipments from Arkansas, Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Texas and Mexico of all livestock except cattle may be brought into the State if accompanied by a veterinarian's certificate of inspection. Cattle may be brought in from the above States when accompanied by a permit from the State Veterinarian. All cattle, sheep, swine or other ruminants from other States are prohibited at this time. Horses, mules and asses may be brought in from any State if accompanied by a permit from the State Veterinarian. Poultry may be brought in from any State.

BEET PULP AND HIGH PRICES.



With the price of bran and other mill feeds soaring nearly out of sight and the price becoming almost prohibitive, more and more dairymen are looking to dried beet pulp as a solution of their feed problem. Of course this feed has been well known and used by dairymen all over the country for some time, but many of those who have been using bran and other mill feeds have hesitated about making the change. The price of dried beet pulp has not been advanced and holds practically the same as it did before the war.

Dried beet pulp is simply the pure shredded root of the sugar beet with only the sugar and water extracted and can be had either plain or with molasses. When moistened it swells to six times its original bulk, thus furnishing as great or greater succulence than silage, and more than five times as much nutriment. It makes a splendid combination with alfalfa as it contains an abundance of carbohydrates and is not only valuable for feeding to dairy cows, but also for hogs, horses, poultry, sheep, etc.

Some San Francisco men have just purchased 500 acres in San Benito county from Mrs. Isabelle Bourcell of San Francisco. The land has both orchard and dairy possibilities, but the new owners are doubtful as to whether they will develop these possibilities themselves or subdivide the land and put it on the market in small tracts.

H. L. MURPHY, PERKINS, CALIF.

Quarantine or Cholera Serum.

To the Editor: The writer has been pained to observe the extreme negligence practiced by some farmers in regard to that most dreaded plague, hog cholera. Many farmers in this country are of foreign birth and speak and understand our language with difficulty, perhaps cannot read it at all, so this negligence may he partly due to pardonable ignorance. On the other hand, means of imparting information on such vital topics are so numerous, and so accessible to all, that surely a large part of this negligence is due to unpardonable ignorance, or willful disregard of the rights of others. It is the practice among these people to turn sick hogs loose. Where fences are not hog tight the animals are sure to visit the neighboring ranch, with great danger of carrying infection. When the hogs eventually die, even if the cause has been proved to be cholera, the owners bury the bodies a few feet below the surface of the earth without the use of quicklime. The disease breaks out periodically on these ranches. The owners themselves have no sooner buried their dead hogs than they are off to their neighbors' yards to replenish their stock. Very few men have the moral courage to forbid a neighhor to step on their ranches, so another yard of hogs is soon afflicted, and thus the disease spreads. These careless people maintain that hog cholera just comes—carried by the air persaps—that it cannot be prevented.

Since this state of affairs exists, is it not possible to enforce greater precautions in those cases where carelessness has prevailed? Why should not a ranch where hog cholera is known to be present he quarantined by a county veterinarian just as a house is quarantined for smallpox? Could the owners not then be compelled to keep off his neighbors' premises until the quarantine was lifted? Could the veterinarian in charge not be empowered to supervise the disposal of the dead bodies and disinfection of the premlses before the quarantine was lifted? Until something like this is done there will always be enough careless and indifferent farmers in the State to keep hog cholera in a flourishing condition.—P. Q. R., California.

In this connection, Dr. Wintringham writes us as follows:

"Legislation looking toward the control of cholera has been discussed, hut no actual steps have heen taken in this State for its control. Premises once infected may be considered always infected. Under our present laws a veterinarian is compelled to report to the State Veterlnarian every outbreak of cholera which comes to his attention. On investigation the State Veterinarlan has then the power to establish such quarantine as he deems necessary.

"When farmers come to realize that in hog cholera serum they have an absolute preventative of cholera, they will use it constantly, as it is the best and only insurance we have for cholera. Dr. Marquis of the State University is now producing serum equal or better than any in the country. In proper hands the use of serum will absolutely prevent outbreaks of cholera."

ALFALFA AND MOLASSES IN RATIONS FOR YOUNG PIGS.

To the Editor: Can a good growing ratlon for young plgs be prepared from whole barley (soaked), alfalfa hay, and stock molasses? My idea is to feed the molasses wlth water. If not, what is lacking to complete an efficient ratlon?—B. L. B., Modesto, Cal.

[Answered by F. W. Woll, University Farm, Davis, Cal.]

[Alfalfa hay, barley, and molasses will make a very good and palatable ration for young pigs; the best method of feeding will be to soak the whole barley in water and mix finely-chopped or ground alfalfa and molasses with it. If a good quality of alfalfa hay is available,' the feed may be mixed as follows: Three parts barley, one part each of alfalfa and molasses, by weight, giving as much of this in a slop of water as the pigs will clean up readily. The slop should be made thicker as the pigs grow older, and more water may, if necessary, be given as a drink. The proportion of alfalfa in the mixture may be increased as the pigs grow older until it makes up about one-fourth by weight, and the cost of the ration thus decreased to some extent.]

CATTLE EAT SALTY FORAGE.

[Written for Pacific Rural Press.]

Two crops of fodder per year, which the stock eat up clean, are grown by a settler on the Natomas Consolidated project in Sacramento county. He grows purebred Duroc hogs and Shetland ponies, and claims that his oat hay cut early in May yields 3½ tons per acre. Immediately after it is cut, corn is planted; and if this doesn't mature, it is cut as fodder when the kernels have dented. The ears are taken off and the stalks stacked in the yard with a large amount of salt which induces the stock to eat it more completely than otherwise. His neighbor, Mr. Jensen, salts his threshed wheat straw, which the cattle eat clean.

"An ounce of salt a day in the rations is all right for cows," says G. L. Stearns, formerly of the Vina Ranch. This is probably not enough, so there ought to be some stock salt in the yards for cows to eat at pleasure. Sometlmes in feeding cows for official test, as much as 3 ounces per day is mixed in the feed. This makes the cows thirsty and they drink more water and produce more milk. But it is necessary to be very careful in feeding salt in the rations, for it is apt to give them the scours and is also likely to cloy their appetite so that they will not eat enough to make a record yield of milk.

The amount put into hay in stacking it depends on the amount of hay each animal is expected to eat. Twenty pounds per ton in general may be all right if the stock has plenty of other food. But a cow which has nothing but hay will eat 5 tons per year if she weighs about 1200 pounds, according to Mr. Stearns. At the rate of 20 pounds per ton, this would force the cow to eat a trifle over 4 ounces per day. which is altogether too much.

When it seems that there is danger of too much salt in the feed, a satisfactory test may he made by offerlng salt separately; and if the cow doesn't eat it, less of the salty feed may be given until she will.

Read What Frank Adams, El Monte, Cal., says about the Victory Milking Machine.

"The Milking Machines you sold me are giving perfect satisfaction. I am milking 16 cows ln 40 minutes, and am going to increase the size of my herd as I can easily take care of more cows. My cows took to the machines from the start. They all give the mllk down readily and I have very little strippIng to do. I can cheerfully recommend the VICTORY to any dalryman and you are at lIberty to refer anyone to me."

What the **VICTORY** is doing for Mr. Adams it will do for you. Don't worry along with hand milking any longer—make yourself independent with the **VICTORY MILKING MACHINE.**

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

Prolificacy in Dairy Breeds.

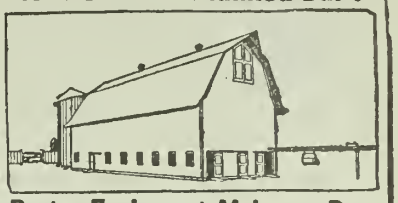
Several articles have appeared recently in the agricultural press giving data regarding the yearly registration by different breed associations, and drawing certain inferences therefrom. Many of these have spoken in such disparaging terms of the Guernsey breed that we thought it well to study the situation and see if an improper interpretation of the data had not been made and to try and correct any unjust impression which might have evolved.

Ten years ago the yearly increase of the registrations for the Ayrshire, Guernsey, Holstein and Jersey breeds averaged 7.66 per cent, the Guernsey breed averaging 9.3 per cent. Last year the average percentage increase of the four breeds was 12.46 per cent, the Guernsey breed averaging 14.00 per cent.

The percentage of increase in every breed of dairy cattle has increased greatly in the past ten years, as the increase in the average shows. Graphic plottings of this data show the rate of increase to have similar trends for each breed association. There are certain years, namely from 1909 to 1912, when the average increase in each breed is greater than at any other time during the ten years period. The reason for this we are unable to state, but the fact that each association experienced a great increase would tend to show that it was due to some external cause rather than any special increase in prolificacy during that period. Every breed but the Jerseys have suffered a decrease in percentage of registrations during various years in this period. We are not in a position to explain these decreases in the case of other breed associations, but for the Guernsey breed, we believe some explanation will help in a clear understanding of the matter.

In the year 1909, we find the percentage of increase to be 10.5 per cent, and in 1910, it jumped to 17.8 per cent. This was due to the fact that a rule was passed by the American Guernsey Cattle Club, requiring a ten-dollar fee for the registration of all animals over six months of age. This, of course, brought in a large number of applications during that year for cattle which had run over the six months' limit and explains adequately, we believe, the abnormal increase in 1910. In 1911, the percentage of increase dropped again to a normal figure of 11.0 per cent, which was, however, a substantial gain over 1909.

Following 1911, the percentage of increase gained rapidly, more rapidly than any other breed association until 1914. This was influenced somewhat, doubtless, by the number of importations made in those years which averaged between 700 and 800 per year. To counteract this, however, we have to consider the fact that the American Guernsey Cattle Club had established, during this period, a system of birth reports, whereby a breeder, on reporting the birth of an animal and filing a sketch of same with the Cattle Club office within thirty days after the animal's birth, could register it any time within three years for the regular fee. In justice to these figures and in connection with the importations, it must be said that there are nearly 5,000 of these birth reports on file at the office, which do not enter into the percentage upon which this study was based. Dividing this up over a three-year period, we find that they will more than offset any increase in percentage of registrations made recently by importations, and is a legitimate consideration in the question of prolificacy. This will bring the percentage of increase during the past year as high as any of the dairy breeds considered in this study. During the past year, each association but the Jersey has experienced a decrease in percentage of increase in their registrations, and the reason for this has been assigned by the secretaries of the various associations to the foot and mouth trouble. Complete reports for the past year could not be obtained for the Ayrshire breed, but for the others this depression seems to have been felt only in a slight degree by the Jersey breed, a little more so by the Guernsey breed and still more by the Holstein breed.



In the number of cattle registered, the Guernsey breed is at the same period of development that two of her sister breeds were over ten years ago. Ten years ago the highest percentage of increase registered by any association was 10.3 per cent, while at the present time, the Guernsey figure is 14.0 per cent, and if birth reports were figured into this calculation, and importations figured out, the increase would reach 16 per cent or practically as high as any breed in registering today.

Guernsey breeders are not worried about their herds becoming smaller from year to year, due to the lack of a proper increase, and are not discouraged by such articles as have appeared in the press speaking unfavorably of the breed in regard to this point, but men who are thinking of entering the dairy business and trying to learn all they can about the different breeds before choosing one as their favorite are sometimes guided in their choice by such articles, and we offer the above as figures and facts to guide the inquirer regarding the Guernsey breed of cattle as to what is the true condition within this breed and its comparison with other breeds of cattle. So far as we can determine from a study of statistics, there is more assurance that the average Guernsey herd will double in a given number of years than there is for some of the other breeds, and just as much assurance as any breed can give.—A. G. C. C.

Word has just been received from the Secretary's office of the Ayrshire Breeders' Association to the effect that Henderson's Dairy Gem 35175 bred by Hill Top Farm, Wheeling, W. Va., owned by Henderson's Dairy Farm, Hudson, O., has completed her year's test for advanced registry with the official record as a senior two year old of 17974 pounds of milk, 738.32 pounds of fat, 4.11 per cent fat, making her the senior Ayrshire two year old Champion of the world.

A half million pounds of California butter will leave San Francisco on July 10, on the steamer Ventura, bound for the Antipodes.

A "PORTER" Planned Barn

Porter Equipment Makes a Barn modern and up-to-date—one that takes care of the largest number of cows and other stock. A barn planned the Porter way saves labor, time and feed, and makes money for the farmer or dairyman every day in the year; it pays big profit on the investment.

The Porter steel stalls, cow stanchions, litter carriers, barn door hangers, hay carriers, and other fixtures are acknowledged leaders everywhere.

Write and tell us the size of barn you want and the number of cows to arrange for, and we will send print with information promptly.

The Porter Barn Plan Service is free whether you expect to build now or later. Send for catalogue of Perfect Barn Equipment.

PETALUMA poultry district, the most densely hen-populated section in the world, seems to have only recently realized the great benefit to be gained by making a combined exhibit of Fancy and Utility poultry at the Exposition, Nov. 18 to 28. If the plans under consideration are carried out, a view of the display from this district alone will be worth a long journey.

Hatch Chicks This Fall.

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n. of California.]

Our articles advocating fall hatching of chicks have created a great deal of interest among poultry keepers in various parts of the State and a number have responded to our request for reports or suggestions.

Simon Hansen writes a short bit of instructive history as follows: "Your letters in the Pacific Rural Press pertaining to fall hatching of chicks have been very entertaining, particularly since I am a mining man and was acquainted with Mr. Mast mentioned in one of the series of letters. While I have never hatched chicks in the late fall, I have raised some that were hatched in July or August; these chicks, after the age of four months, were raised under the snow on the Sierra Nevada Mountains about fifteen miles from Grass Valley, Nevada county; and what may also appear impossible, the pullets were laying before the snow disappeared in the spring. However, persons who have had experience with the conditions in that section of deep snows will not be surprised. In that neighborhood, the snow is frequently from ten to thirty feet deep, depending on the weather and conditions favorable for drifting.

"We had an arbor reaching from the cabin to the barn and when the snow began to gather each year, we covered this arbor with panels, thus converting it into a tunnel which was the passageway from cabin to barn. During the winter that I refer to, the barn was used only to store fuel and such bulky things that could not be kept in the cabin, and the chickens. A large skylight furnished light and more or less sunshine. During or after a storm or snow fall, it was necessary to clear the snow off this light. When the snow became deep enough and the accumulation on the light became heavy, it was necessary to 'snow shoe it' as near as possible and work the snow off from the outside. Those chickens were as happy and contented in their winter quarters as any flock I have seen anywhere.

"Perhaps some of your readers may have known a noted poultry breeder, a James Quick of Badger Hill, who also wintered his fowls in a similar manner. His place was only a few miles from the location at which I had my fowls. I remember that some fifteen or twenty years ago he showed me the fowls he had selected to send to a poultry show somewhere on the Coast. This must have been in the early part of the winter, probably December. One of the fowls was a young Brahma rooster less than a year old and the largest I ever saw; I distinctly remember that he afterward said it attracted much attention at the show, where it was weighed in at sixteen pounds. To be less than a year old at the time of winter poultry shows this fowl must have been hatched and partly raised in the winter quarters while they were either entirely covered with snow or completely surrounded by it.

"The point I wish to make is this: If chicks can be hatched and raised in the Sierras under such conditions, it surely should be easily done in the valleys and on the Coast."

PETALUMA WILL SHOW.

Contented because Petaluma is considered the greatest poultry district in the world, the individual fanciers and poultry farmers have until now made no concentrated effort to make a display at the Universal Poultry Show to be held at the Exposition Nov. 18 to 28; they seemed to be indifferent to the mutual advantage to be gained by working together for a good display of both fancy and utility fowls. Apparently this was due to the lack of an energetic leader, who has now appeared in the person of Vincent B. Huntley. From a letter received from F. L. Hall, an expert poultry breeder well known to the poultry keepers of California, we learn of the present get-together movement. Mr. Hall states, in substance, that during a recent visit to Petaluma, Mr. Huntley called him into consultation over the tentative plans. Omitting the many details contained in the letter, we briefly state that the conference resulted in the co-operation of the Chamber of Commerce, merchants, real estate dealers, and bankers. It is quite likely that these interests will subscribe to a liberal fund to assist in paying for an exhibit that will maintain Petaluma's reputation and bring added profit to the district.

KEEPING EGGS FRESH.

[Written for Pacific Rural Press by Geo. H. Croley.]

The State and Federal authorities are devoting much time and attention to the methods used in handling and storing eggs; there is much difference of opinion as to the proper temperature for preserving them for future use, and in regard to other conditions surrounding them while held in storage.

As an illustration of the keeping qualities of perfect eggs, let us notice what was accomplished many years ago without the use of ice. At that time cold storage had not yet become an important factor in the preservation of eggs.

As an experiment, during March, I selected a lot of thirty fertile, fresh eggs, loosely wrapped them in papers, and placed the wrapped eggs in a large splint basket. This basket I put in the back of the store among a lot of merchandise of various sorts, but clean and odorless. This location was also within ten feet of a steam boiler and furnace, but separated from them by a very thick brick wall. This, together with the other existing conditions, was responsible for a uniform temperature night and day, which seldom varied far from fifty-one degrees. The eggs

California Poultry Practice

Written to Teach Better Poultry Methods on the Farm.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

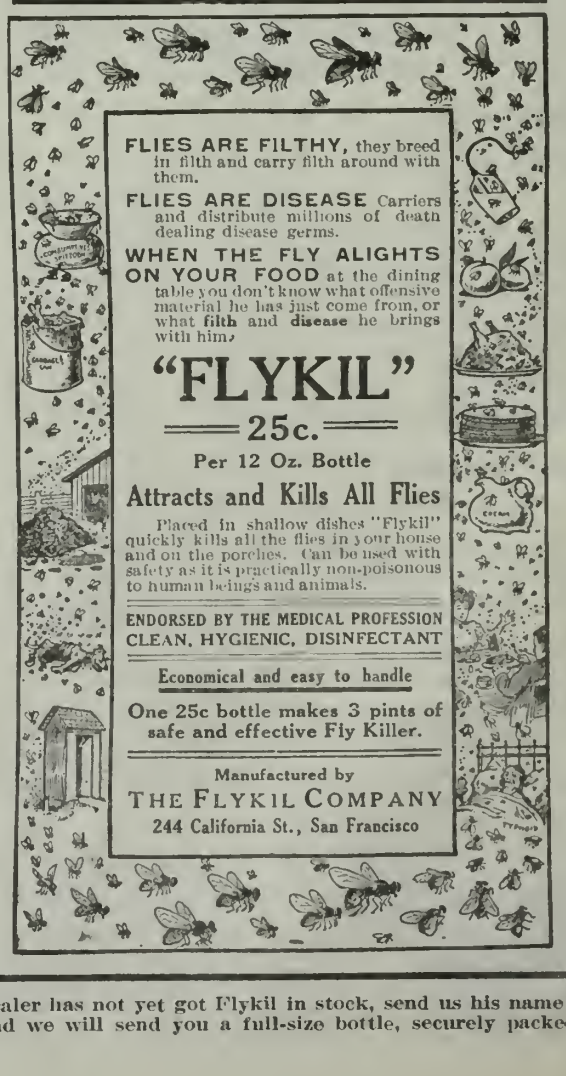
With forty-five years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you thinks so?

There are boks, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.



Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers

525 Market Street, San Francisco.

were turned occasionally, but otherwise nothing was done to preserve them.

During the following October, in order to test the result of the experiment, these eggs were delivered as fresh ranch eggs to a family for ordinary table use. While handling and eating them, these folks not once suspected any deception, although they were repeatedly asked, "Are those eggs all right?" They pronounced them excellent and after they were all used it was difficult to convince them that these eggs were more than six months' old.

They were, of course, from vigorous, well-fed hens, provided with clean nests, and were practically perfect eggs that had been properly gathered and handled from the time they were laid.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

WOMEN SUCCEED BEST.

We are not going to cast any reflection on men as poultry breeders, but will try to show why women should make a better success than men, in a great many cases.

Not all women are so built that they would make as good success as some men, but the average woman can succeed if she starts out right. The poultry business is one of small details, even when run on a large scale; there are so many details to it that the average man does not think them important enough to bother with. He reasons some way like this: "Oh, well, that's such a small matter I will leave it for the present." If it is a little chick just starting with a cold, and it gives the cold to a dozen more, then it has assumed a good-sized problem and the man realizes it is time to be doing something.

Now a woman would chase that little chick up one alley and down another, if necessary, because her mother instinct would be aroused and she would want to help it; and the helping of one would most likely put an end to the cold in the flock, thus saving endless trouble.

This is typical of the difference in men and women. Men are built on a plan that fits them for grasping a large contract or problem better than a small one that requires watching. It is simply a matter of centuries of education that has drilled men for the larger things and left the smaller to women. In the old days before incubators came in fashion, raising poultry was a woman's work altogether.

In the raising of fancy poultry, too, women can be more successful because they have a better idea of what a chick can digest, and the quantity of feed that it needs to keep it growing. Our California women get considerable exercise in finance these modern days, so I see no reason why they can't come even on the financial side.

It does not require any great amount of learning to make a success in poultry, but it does require a person with good common sense. A breeder of poultry must have an eye as to the fitness of the stock. And, no matter what breed they engage to raise (mind, raising and breeding are two different things) the breeding comes first; and no matter what breed you have, you must know them like a book, before you can make a success with them. But it takes time to know a breed; you can raise them and gain the knowledge at the same time by observation and comparison.

So while it takes time to gain the knowledge that makes success as a breeder, the average woman can make a success right from the start as a raiser of chicks; and that is where most women shine.

From what I can learn, there are a goodly number of women going to try out the poultry business this year. As most of these women are either widows or women who have to struggle along for their own living, it is necessary that they make a success right from the start. They simply can't afford to experiment. To these and others who want to start but are afraid to venture, I want to say that though things do not appear to be very prosperous at present, if they will raise the stock right and not feed any drones, they will come out all right. There certainly is not any great wealth in any branch of the poultry business, but there is a living, provided we watch the leaks and keep in mind the details. There are quite a few leaks, even in raising chicks. For instance, you can throw down more feed at one time than the chicks need, thinking it will be there when they do need it. But perhaps before they need it the feed has become dirty or birds have had a fill out of it and the rest goes to waste. With chick feed as high as it is this year, all waste must be eliminated as nearly as possible. Another leak may be leaving brooder lamps burning during the day time when the chicks are out on grass. If the morning is bright turn the lamps out as soon as the chicks run out, then during the day you have time to refill the lamp, clean out the brooder and fix things for the night. In filling lamps always leave a little space at the top; an overfull lamp is very likely to make trouble.

If you are just a beginner, get a few hens of any breed to practice with and get an understanding of the needs of poultry, for they all have general needs and all require treatment that may be classed as general; though between the small breeds and the large there is quite a difference.

The large breeds must be fed more sparingly of fat-forming feed and must be force to exercise for what they do get. The small breeds will get exercise without any forcing and they can stand a much richer kind of feed. But even here it is not wise to feed all the fat-forming feed they will eat. Even Leghorns get overfat sometimes. Breeders of all kinds are better for being underfed rather than overfed. The chicks are also more likely to be strong than if the hens have been overfed.

Some young women who have been in the poultry business about two years wrote me that they cannot get their pullets, no matter when they are hatched, to lay without stopping to molt. The pullets mature seemingly, lay a few eggs, then go into molt. Now my experience is that this is caused from feeding the pullets too much forcing food, such as dry mash, before the proper time for them to mature. So many writers urge people to feed, feed and make the pullets come through. Nature says, "Hold on, I have a say in this," and just when the pullets should really be commencing to lay for keeps, they are laying off to molt.

What can be done? Why, it is all right to keep the pullets growing. I hold with that, but don't force maturity by too strong a feed. Coarse food, plenty of it, and green feed in plenty with exercise, will keep them growing. For Leghorns, the pullets should be fed this way until five or five and a half months old, then feed them all good rich food you like and they will use it to advantage. Most all of the commercial mashes have labels advising the free use of this mash from chickhood to maturity. Well, I say don't do it; let them grow and use their gizzard on something coarser than mash.

TURKEYS HAVE COLDS.

To the Editor: What is the matter with our little turkeys. Their heads swell, and eyes are sore; they run at the nose, and their throats are sore.—H. McK., Fair Oaks.

[We believe they are suffering with Avian Diphtheritic Roup which appears in the first stages as a mild cold or it may be the cold that provides the opportunity for the disease to become active. This disease is very contagious and affects chickens, turkeys, ducks and a number of other fowls. You should separate the sick birds at once and disinfect the premises by spraying or painting houses or yards with some strong disinfectant. However we may not be correct and to be certain write at once to the Poultry Division, State Farm, Davis, Cal. and also send one or more of the sick birds (according to whether you have a small or large flock) to the same place. They may be sent either dead or alive. While waiting for a reply put in the drinking water for all the fowls, both sick and well, ten drops of carbolic acid to a gallon of water, or liquid sheep dip may be substituted if you have no acid. Even coal oil, a teaspoonful may help. You might also put Epsom Salts in some moist mash food.]

THE MOO-COW-MOO.

My pa held me up to the moo-cow-moo
So clost I could almost touch,
En I fed bim a couple of times, or two,
En I wasn't a fraid-cat — much.

But ef my papa goes into the house,
En mamma, she goes in, too,
I just keep still, like a little mouse,
Fer the moo-cow-moo might moo.

The moo-cow-moo's got a tail like a rope
En it's raveled down where it grows;
En it's just like feeling a piece of soap
All over the moo-cow's nose.

En the moo-cow-moo has lots of fun
Just swinging his tail about;
En he opens his mouth and then I run
'Cause that's where the moo comes out.

En the moo-cow-moo's got deers on his head
En his eyes stick out o' their place,
En the nose o' the moo-cow-moo is spread
All over the end of his face.

En his feet is nothing but finger-nails,
En his mamma don't keep them cut;
En he gives folks milk in water-pails,
Ef he don't keep his handles shut.

'Cause ef you or me pulls the handles, why
The moo-cow-moo says it hurts,
But the hired man he sits down clost by
En squirts, en squirts, en squirts!
—Edmund Vance Cooke.

POLLY PUTOFF.

Her real name was Polly Putnam, but everybody called her Polly Putoff. Of course, you can guess how she came to have such a name. It was because she put off everything as long as she possibly could.

"Oh! You can depend on Polly for one thing," Uncle Will would say. "You can depend on her putting off everything, but that is all you can depend on." And I am sorry to say he spoke the truth.

"Polly, Polly," mother would say in despair, "how shall I ever break you of this dreadful habit?"

It was just three days to Polly's birthday, and she had been wondering very much what her mother and father intended to give her. She thought a music-box would be the best thing, but she was almost afraid to hope for that. A man who went about selling them had brought some to the house, and Polly had gone wild with delight over their pretty musical tinkle.

"Polly," mother said that morning, "here is a letter that I want you to post before school."

"Yes, mother," answered Polly, putting the letter in her pocket.

As she reached the school-house, she saw the girls playing; and she stopped "just a moment." Then the bell rang, so she could not post the letter then. She looked at the address. It was directed to a man in the next town. "Oh, it hasn't very far to go. I will post it after school."

After school she forgot all about it.

"Did you post my letter, Polly?" asked mother, when Polly was studying her lessons that evening.

Polly's face grew very red, and she put her hand in her pocket. "I will post it in the morning," she said faintly.

"It is too late," answered mother. "The man to whom the letter is directed went away this evening and I haven't his address. It really only matters to yourself, for it was an order for a music-box for your birthday."

"O mother," exclaimed Polly, "is it really too late?"

"I don't know where he is now," said mother. "If you had not put off posting the letter, he would have received it before he started, and sent the music box. It is too late now."

Wasn't that a hard lesson? It cured Polly, though; and she has nearly lost her old name.—Christian Uplook.

HOME MADE "LOGAN" JUICE

Take clean, fresh ripe loganberries and heat to the boiling point with just enough water to keep from burning; remove from the fire at once and strain through a coarse sack. Take the juice, sweeten with three pounds of sugar to each gallon, set back on the stove and again heat to the boiling point, not letting it boil. Pour into ready cleaned and heated bottles and seal immediately. Common soda or pop bottles are good for this purpose to be corked and sealed with paraffine; or, glass fruit jars sealed in the usual way. The bottled juice is then set away in a cool and dry place, where it will keep for a long time. When wanted for use it is simply poured from the bottles, diluted to taste, and it is then a fit drink for a prince. Don't let your surplus berries go to waste if you like a good soft drink. Make some of them into juice for table use.

TO MAKE BARLEY WATER.

Barley water is a fancy of the moment and a famous brew is made at a New York club. Not many people know this recipe, but here it is: Put a breakfast cup of well-washed barley into a dome-shaped strainer. Put this over a two-gallon jug and then add eight lumps of sugar and the rind of eight lemons.

The boiling water must be allowed to drip on to this from a boiler. It ought to drip very slowly and the barley water should have two hours to brew if it is to be a success. Before setting it on ice to cool off add the juice of half a lemon. When cold it should be quite clear. This of course makes a large allowance.

SMALL ECONOMIES.

A small economy, requiring only a little thought and care, is to save the liquor after boiling corned beef. When cold, a cake of grease will have formed over the top. Remove this cake and place in a dish on the stove, melting and simmering slowly until it stops bubbling, then strain through a cloth. With very little butter this shortening will make excellent plain cakes, gingersnaps or cookies. It is nice and brown, and will make a very good brown gravy

A strong character, whether its influence is good or bad, dominates the atmosphere in which it is placed. If it is your boy who is that strong character, dominating it with his ill tempered or sullen ways, it is your duty as a mother, and as a mother with dignity, to find a way to put a stop to the injustice to the others.—Louise Mitchell.

"George," said Hilda, looking up from the morning newspaper which she was reading "it says here that another octogenarian is dead. What is an octogenarian?" "Well, I don't know what they are, but they must be very sickly creatures. You never hear of them but they are dying."—Dallas News.

Ants Cannot Exist

Where the Following Simple Method of Extermination Is Pursued.

Ants are persevering insects. They persist in living long after you think you have put the quietus on them forever. A cat may have nine lives, but he has got nothing on an ant in this respect.

Many remedies have been tried on ants without result, but one has at last been discovered which will absolutely put them out of business. A baker and candy-maker in Los Angeles, driven to distraction by this pest, prepared a paste which drove every ant out of his shop in one day. Ants cannot exist where this remedy is used. Thousands of testimonials from all over the country bear witness to its efficacy.

It is put up for general use under the name of Kellogg's Ant Paste, and can be obtained at all good druggists. Try a package today and end your ant troubles for all time.

WEDDING PRESENTS.

Table linen should never be given to a bride except by her immediate relatives, who occasionally make it a joint present to the young people. It falls into the category of house furnishings, and this it is the business of the bridegroom to attend to.

The question when to send wedding presents is a very moot point. It is not expected that anyone should send until the date of the marriage is settled, and the fixture of the event is the time-honored privilege of the bride. The usual course followed is to send a present, with a note of good wishes, a few days after the receipt of the invitation to the wedding.

It is the bride's duty to acknowledge each present—to fail to do so is an almost inexcusable offense against the laws of courtesy and good taste.

The letter should be dispatched immediately on receipt of the present, and the wording should be simple and to the point, though, of course, this will vary much according to the relationship existing between the bride and the donor.

FOR THE DINNER TABLE.

Silk and satin decorations have had their day. They are seldom seen now and jar on good taste, because we instinctively feel that all table ornaments should be of washable materials, since they are liable to become soiled.

Tea experts tell you that 90 per cent of the desirable stimulating quality and 10 per cent of tannin is extracted the first four minutes. If tea steeps longer the extraction of tannin predominates, destroying the delicious aroma and giving tea an acrid taste.

When buying bacon choose that with a thin rind and with firm fat of a pinkish white.

If milk is used instead of water when mixing mustard for the table, it will look fresh for several days.

PACKING SUMMER CLOTHES.

I am sure you all dread packing clothes in a trunk or suitcase, and yet it is not an unpleasant task if it is done properly. To fold a skirt for packing lay it on a flat surface, and even the lengths at top and bottom edges, keeping the exact back of the belt to the center front of the waist belt; then turn the sides of the skirt, folding toward the back; lay tissue paper between the folds, in this way narrowing the skirt to the necessary width for packing. Fold over the top of the skirt to shorten the length for a short tray and put a thick roll of tissue paper under the fold to prevent the skirt from creasing crosswise. In packing a waist, button or hook it, and then fill the sleeves and the body portion with crumpled up tissue paper. If it is necessary to narrow the waist for a small space, fold it also toward the back, and lay tissue paper between the folds. Coats should be laid out flat and the sleeves and front portion at the bust line filled with wads of tissue paper.—Mrs. Ralston.

"No wonder the Scotch get rich," said a man, laying down a magazine about the multimillionaires of Scottish blood. "No wonder." He puffed his Havana thoughtfully. "An Irishman and a Scotchman went into a bar one day," he said. "But the Irishman had no money." He blew a fragrant cloud towards the ceiling. "So they came out," he said, "without a drink."—London Opinion.

KEEPING FLOWERS FRESH.

An authority on flowers has this o say in regard to their preservation: "Place the flowers in a vase filled with fresh water to which a little charcoal or a small piece of camphor has been added. The vase should be set upon a plate or dish and covered with a bell-shape glass. Around the edge of the glass a little water should be poured, so that air will be excluded.

"If fresh cut flowers need reviving, place the stems in boiling water, and by the time the water is cold the flowers will have revived. Cut the ends of the stems anew and place in fresh cold water."

A MATTER OF CONDUCT.

The girl who is proud of her "Bohemian" tendencies will always find men ready to meet her more than half way.

The girl who carefully keeps her feet from straying into lax by-ways and occupies her time in useful activities will not find mankind totally depraved.

DON'TS FOR MARRYING.

A recent periodical has given the following sensible don'ts for the consideration of girls contemplating matrimony:

Don't marry to reform a man. He who would not reform before marriage is not likely to do so afterward.

Don't marry a man to whom you have said "yes" in a moment of sympathy or sentimental ecstasy.

Don't marry a man who has only his love to recommend him; there are other qualities in a husband quite as important as love.

Don't marry a man for livelihood; there are better, safer and more honorable ways in which a woman may earn a livelihood nowadays.

Don't marry a man who threatens to go straight to the bad if you refuse him.

Don't marry a man because he is handsome or because he wears his clothes well.

Mr. Williams: Wha' yo' doin' dat fo', Mr. Jo'son—puttin' mosquito nets up dis time in de year? Mr. Johnson: Waal, yo' see de doctor tole me de air war full of dis yer grip microbes; so I's takin' precotions agin gittin' 'em into de house. —Harper's Bazar.

July 31 will be San Joaquin Valley day at the Panama-Pacific Exposition.

READY BUILT HOUSES

Build YOUR Home—Eliminate Builder's Profit.

Build it yourself. The plans that accompany one of our "knock down" houses are so explicit and simple, that you or any member of your family can build your home by spending their spare time fitting the numbered pieces of material together. And that's all there is to it.

In buying one of our houses you save on initial cost—on labor—and there is no waste material—just enough to build a complete home. Satisfaction guaranteed. COMPLETE homes for as low as $205.

READY BUILT HOUSE CO.

973 Broadway. Portland, Ore.

The Markets.

Unless otherwise noted prices are f. o. b., San Francisco.

San Francisco, July 7, 1915.

WHEAT.

The local grain exchange closed Friday, and on opening Tuesday there was practically no trading in any description of grain. Wheat prices, however, show a firmer tendency, with reports of some large sales for export and indications of a better movement.

Cal. Club, ctl.	$1.70	@1.72½
Forty-fold	1.75	@1.80
Northern Bluestem	1.80	@1.85
Northern Club	1.70	@1.72½
Northern Red	1.70	@1.80

BARLEY.

No further change is noted, and locally the market shows little strength, as offerings are liberal and include a good deal of poor grain, while the demand so far has been limited. Growers in the Valley, however, are inclined to hold their grain.

Choice Feed, ctl. ....$1.02½@1.05

OATS.

There has been no business of any consequence here for the last week, and values stand nominally as before.

Red Feed	$1.35@1.45
White	1.45@1.50

CORN.

Business is limited to small jobbing operations to meet current needs for feed, which are not especially heavy at the moment. Values are unchanged.

California Yellow	$1.75@1.80
Eastern Yellow	1.80@1.85
Milo Maize	1.75@1.80
Manchurian	1.40@1.60

BEANS.

The local market has eased off again, bayos and cranberry beans, pinks and large whites all showing a slight decline, while horse beans have dropped sharply. Business here has been very quiet, and there is an ample supply of most varieties on hand. Some large sales are reported in the country, however, shipment being delayed until a cut of eastern freight rates takes effect; and if there is a fair renewal of buying after that it is believed that the old crop will be pretty well off the market before new beans are shipped. A large acreage is going in, and with favorable weather conditions the crop will be large.

(On Wharf.)

Bayos, Cal., per ctl.	$3.50@3.75
Blackeyes	5.50@5.65
Cranberry Beans	3.50@4.00
Horse Beans	2.25@2.75
Small Whites	4.00@4.15
Large Whites	3.75@3.90
Pink	3.15@3.40
Limas	4.00@4.15
Red Kidney	4.90@5.00
Mexican Reds	4.90@5.00

SEEDS.

There is practically no business in any line at present, and prices stand nominally at the same level as for some time past.

(Wholesale prices, San Francisco.)

Alfalfa	17½@18½c
Brown Mustard, per lb	Nominal
Canary	10 @12½c
Hemp	3 @ 3½c
Millet	2½@ 3 c
Timothy	7½@ 8 c

HAY.

Arrivals continue large, and there has been very little life to the market for local consumption. Dealers, in fact, see little in conditions here to lead one to expect improvement, as it is estimated that the number of horses kept in the Bay cities is decreasing in number; and the recent departure from business of a large stable is cited as a discouraging factor. The situation in the country, however, tends to improve a little, mainly on account of the development of export markets, which have facilitated a cleanup of old stock and are now aiding in the movement of the new crop. Australia has taken a heavy tonnage, and reports come from the country of large purchases of alfalfa for the Atlantic States and even for Europe. The quality of new wheat and oat hay is very good. Volunteer hay is plentiful, but rather slow to move.

(Prices per ton, carload lots, on track, San Francisco.)

No. 1 Wheat, per ton.	$11.00@11.50
do. No. 2	8.00@ 9.00
Barley	5.00@ 8.00
Tame Oats	7.50@12.50
Wild Oats	6.00@ 8.00
Alfalfa	6.00@ 9.00
Stock Hay	4.50@ 5.00
Straw, per bale	.40@ .45

FEEDSTUFFS.

Prices show no change whatever, and business for the last week has been only of a small routine jobbing nature.

(Wholesale prices per ton, carload lots, San Francisco.)

Alfalfa Meal, ton	$14.00@15.00
Alfalfa Molasses Meal per ton	18.00@19.00
Bran, per ton	29.00@30.00
Oilcake Meal	None here
Cocoanut Cake or Meal	25.00@26.00
Cracked Corn	40.00@41.00
Middlings	34.00@36.00
Rolled Barley	23.00@24.00
Rolled Oats	33.00@34.00

VEGETABLES.

Business was rather quiet early in the week, and with somewhat heavy offerings in nearly all lines prices show some easiness, though comparatively few changes in quotations are noted. String beans have been in rather heavy supply, and ordinary stock is lower. Offerings of asparagus have been in excess of requirements, and $1.25 is the outside price, while canners are taking the surplus at about 75c. Merced potatoes stand about as before, but Los Angeles lugs find better sale, bringing up to $1.10. Rhubarb is a little lower, being hard to clean up. Cucumbers are considerably lower, with liberal shipments from several districts, while eggplant has stiffened up. Green corn holds up fairly well, but the top price is lower.

(Wholesale prices, San Francisco.)

String Beans, lb	1½@ 3½c
Lima Beans	5 @ 8 c
Celery, crate	.50@1.25
Lettuce, crate	.75@1.00
Asparagus, box	$1.00@1.25
Peas, sack	.75@2.00
Peppers, bell, lb.	10@12½c
Tomatoes, crate, Merced	.35 @50c

Summer Squash, lug	.20 @50c
Green Corn, sack	1.00@2.50
Okra, crate	.75@1.25

POTATOES AND ONIONS.

There is little change in this market. River potatoes are a little steadier, but still show no great strength, while onions stand as before, with a very fair demand for new red stock.

New River Potatoes, ctl.	.85@1.15
Onions, yellow, ck	60@65c
Red, sk.	60@65c
Bermudas, crate	.90@1.00
Garlic, per lb. new	5@6c

POULTRY.

The last few days have brought in very little California stock, and with rather light arrivals from the east the market is in a much stronger position than for about a fortnight past, supplies being now rather light. Price changes are not important, but broilers and fryers are a little higher.

(Wholesale Prices, San Francisco)

Live Turkeys, lb	15 @17 c
Broilers	20 @21 c
Fryers	21 @23 c
Hens, extra, per lb	16 @17 c
Small Hens, per lb	13 @14 c

Squahs, per doz	$2.00@3.50
Geese, per pair	2.00@2.50
Ducks, young, lb	14 @15 c
Old	13 @14 c
Belgian Hares	6 @ 7 c

BUTTER.

Extras show another slight advance, though prime firsts are lower. The local demand is fair, and the market is helped out materially by the Australian business, which took about 700,000 lbs. the first of the week, with more to follow about July 20. Liberal shipments are coming in from the north.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25½	26	26½	—	26½	26½
Prime Firsts	25	25	25	—	25	25

EGGS.

Extras have stiffened up materially since the first of the week, and other grades also show a slight advance. The firmness is due in part to light arrivals after the holidays, while the local demand is keeping up in good shape.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	23½	24	24	—	25	26
Firsts	21	21	21	—	21	21½

DECIDUOUS FRUITS.

A few seedless grapes are coming in, and clean up readily at high prices. A few lots of huckleberries have also appeared, bringing over 20c per lb. Other berries are firmer, with comparatively light arrivals, red logans, strawberries and blackberries all being higher. Satsuma plums bring rather higher prices, other varieties being easy. Figs are considerably lower. Cherries have eased off a little, as there are still a good many coming in. Apricots in lugs are quite easy, with a good deal of ripe stock offered, but choice lots in small packages are steady. Crated peaches show some firmness, but Delta basket stock sells down to 50c, and weak at that. Some new Gravenstein apples are appearing, selling up to $1.75. Melons are unchanged, but cantaloupes are very easy. Casabas are expected earlier than usual.

Loganberries, hlk, chest.	$1.50@2.50
Loganberries, red	3.00@3.50

DRIED FRUITS.

Considerable business is being done on new crop fruit in the country, but the local packers do not seem to be taking hold very readily, and from all that can be learned the trade everywhere shows the same apathy that has characterized trading for the past year. The outlook is decidedly uncertain, and all buying interests are anxious to avoid loading up until assured of a market. There is also the seasonable desire to exert a bearish influence in the country, and with this in mind growers are not disposed to stampede. According to some packers, the market is going to be very sick in the next few months; but it seems unsafe to venture definite predictions one way or the other, and England is said to be out with large inquiries. At present, new white figs are quoted a little lower, 3c seems to be the top price for prunes, and peaches show a decline. The only especially interesting feature is the strong English demand for spot prunes, good sized purchases of which have been made for prompt shipment from New York. The New York Journal of Commerce says:

"A sale of 4,000 boxes of prunes at the full quoted price was made in the New York spot market July 2 for immediate shipment to Europe. England is increasing her inquiries and it is said constant shipments are being provided for by factors here. According to one large holder, it looks like a big business soon and there will undoubtedly be more sales made in the near future. London brokers are showing an interest and are asking for samples daily from the market here.

"Supplies of all sizes, both California and Oregon, are becoming very scarce on the local market here.

"Demand for local needs is only being made in small quantities owing, it is said, to the limited supply which is available. No new shipments from the Coast of any size are expected to be received until the new crop begins to arrive about the middle of October. Until then what is now on hand will have to satisfy the immediate needs of the factors here. Prices are being maintained and in some quarters it is said that higher figures are expected soon. At least the tendency of the market is toward a higher level.

"A very satisfactory demand is being shown for raisins, it is said, upon the basis of the prices which have been quoted by the Associated Company for shipments of old crop during August and September. The call for spot stocks is good. The supplies of fine quality raisins in the market is not found to be large, much of the fruit being of an inferior quality. With European buyers asking for bids the trade in raisins is increasing, according to brokers who are in a position to know."

(Prices to Growers.)

CITRUS FRUITS.

The eastern auction points have eased off a little in the prices paid for Valencia oranges, but good figures are still being paid for the fruit, averaging from $2.40 to $4.60 per box. Lemons are beginning to attract more attention now that the hot season is on and it is expected that better prices will soon be realized. Shipments from California are averaging nearly 100 cars per day.

Notwithstanding the abundance and cheapness of deciduous goods, Valencia oranges find very ready sale in the San Francisco market, and prices have been marked up. Grapefruit also is somewhat higher, with quite a lively demand locally.

(Wholesale Prices, San Francisco.)

WOOL.

Sales have been reported recently in the Ukiah district at 25c or better, but there is not much offering now that would bring such prices. Some large sales have recently been made in Oregon, and a good many clips are still being picked up by local buyers, who report a good demand in the east.

HORSES.

The market locally shows the effects of the holiday, with buyers entirely apathetic and nothing of an especially attractive nature coming in. While, according to reports from some well informed parties, the number of horses used in San Francisco and vicinity is decreasing, desirable drafters still find fairly good sale here, and good stock of nearly any weight brings comparatively good prices. Buying for Europe is cleaning up a great amount of stock in the country, though practically none of it is of a type desired in the San Francisco market.

(Approximate values at San Francisco, based on auction sales.)

FRUIT MARKET AND CROP CONDITIONS IN THE SANTA CLARA VALLEY.

A well known grower of the San Jose district sends us the following:

"The fruit market in the Santa Clara Valley is suffering from general apathy, or perhaps from something worse than that. The drying season has begun and the bulk of the apricots and prunes is still in the hands of the growers, in just what proportion cannot of course be accurately known. Estimates of the quantities of these two fruits still held by the producers vary from 75 to 90 per cent. Probably more prunes than apricots have been sold and the prune market is now stronger than the apricot. Offers of 3½ to 3⅞ cents per pound are made for prunes with but few sales. The range on apricots is from 6½ to 7¼ cents per pound with little business done. Both packer and grower are watchfully waiting.

"Canners have bought a few apricots at $25 per ton from San Francisco commuters in the Los Altos-Mountain View district, and $30 per ton have been paid for choice lots in other sections. There are also reports of sales at $20-$22 per ton. Many growers have refused offers of $25 per ton and have made arrangements to dry their fruit. Apricot pits are now sought for at $24-$27 per ton, the higher price being paid for the larger lots. Many pits were sold early in the season for $18-$20 per ton.

"Neither apricot nor prune crop prospects are as good as they were a few weeks ago. In some orchards cots have fallen badly and the best informed growers estimate this year's crop at not over 60 per cent of last. The prune aphis continues to spread and in many cases crop damage will result unless the pest is checked through hot weather or other natural causes."

Publisher's Dept.

Read our book announcement in another column. Everyone of these books are of the greatest practical value in your farm operations. We are prepared to take care of your orders.

Since printing our last issue the office of the Rural Press has been moved from the third floor to the second floor of the Underwood Building, 525 Market St. In our new quarters we have one-third more space than before. The extra room was necessary to accommodate our increasing business. Come and see us when you are in San Francisco.

The Hinman Milking Machine Company, with offices and factory at Oneida, N. Y., received international prestige by being awarded the gold medal for its machine at the Panama-Pacific Exposition. The medal is the highest given for this branch of exhibits. The Hinman Company received ten points credit toward the medal early in the year by having its exhibit in place on time. The Hinmans have secured three other gold medals for their machine. One was won at the Waterloo (Ia.) Dairy Cattle Congress and two others at State fairs in Mississippi.

AMERICAN DRIED FRUITS POPULAR.

The Bristol, England, Chamber of Commerce reports that shipments of dried fruit from San Francisco to Bristol via the Panama Canal have arrived in excellent condition. This route has the advantage of giving a more certain date of arrival as well as a much lower freight rate than the overland route. The war has, however, had the natural result of causing uncertainty as to the requirements of the dried-fruit trade. Imports of currants from Greece for the season have fallen slightly below those of previous years, but the trade in raisins from Spain was practically normal. The importation of Smyrna sultanas was about half that of the preceding year owing to the closing of that port after Turkey entered the war.

The business done during the Christmas season was beyond expectations, and there was a very general demand for all classes of dried fruits. California fruits continue in good demand, prunes making $12.65 to $13.38; dried apricots, choice Royal $13.38, fancy $15.09; apple rings, prime $9.73, choice $10.22. California evaporated fruits are meeting growing popularity, and local importers express the opinion that with the improved shipping facilities now available the consumption of this fruit is likely to increase year by year.—"Commerce Reports."

When a Certain San Francisco Shipper

announces to the trade that he will cut the Exchange's net or lowest price on new crop almonds, regardless of what that price may be, it serves as an object lesson to every grower who has been indifferent to the necessity of co-operative marketing.

Agriculture Horticulture Floriculture

By

E. J. WICKSON, A. M.

Professor of Horticulture in the College of Agriculture of the University of California; Horticulturist of the Agricultural Experiment Station; Member of the National Council of Horticulture, Etc., Etc., and Editor of the PACIFIC RURAL PRESS.

CALIFORNIA FRUITS AND HOW TO GROW THEM.

Price, $3.00, postpaid.

A Manual of Methods, which have yielded greatest success, with the list of varieties best adapted to the different districts of the State. Seventh Edition—Fully revised.

CALIFORNIA VEGETABLES IN GARDEN AND FIELD.

Price, $2.00, postpaid.

A Manual of Practice, with and without irrigation, for semi-tropical countries. Third edition—Revised and Extended.

CALIFORNIA GARDEN-FLOWERS, SHRUBS, TREES AND VINES.

Price, $1.50, postpaid.

Written with the hope of assisting flower lovers to attain greater joy and satisfaction in the common growing of flowers. The writer gathers suggestions from his own experience and enriches them with his observations and study of the work of others; but studiously avoids the perilous heights and the academic phraseology of the botanist as he does the devious methods of the commercial florist. A valuable and instructive book for the amateur flower gardener. First Edition.

ONE THOUSAND QUESTIONS IN CALIFORNIA AGRICULTURE ANSWERED.

Price $1.50, postpaid.

Consists of 1000 of the most important questions on every subject that have perplexed the farmer and which have been submitted to the editor. The problem appears with its solution by Prof. Wickson immediately following; a comprehensive index enabling the reader to find the subject which interests him without delay. The 1000 questions and answers cover Fruit Growing, Vegetable Growing, Grain and Forage Crops, Soils, Fertilizing, Irrigation, Live Stock and Dairy, Diseases of Animals, Feeding Farm Animals, Poultry-keeping and Pests and Diseases of Plants.

This is a book of reference that every farmer, no matter in what branch of farming he is engaged, should have on his shelf. First Edition.

These four works are written by a Californian who, for forty years, has made a study of Californian conditions, and who is recognized as the highest authority in the State on the subjects treated. They should be in the library of every California Farmer.

What Thinking is Doing for Beef.

[Written for Pacific Rural Press.]

THE statisticians who have been so busily engaged telling us about the world-wide meat shortage should certainly be complimented for at least one thing: they have got everybody from producer to consumer thinking of "more meat"; thinking is a pretty good thing for progress in any line of business.

Before the statistician started on his crusade, the California beef grower began to see that his area for maturing and fattening cattle was fast being diminished by diversified farming. He knew that much of the range land is so rough that it is only adapted to cattle breeding and that he could, therefore always expect to breed cattle. But how to mature and fatten them economically — that was and still is the question.

Now it has so happened that the range owner is not the only one who pricked up his ears when we began to hear about the immense shortage and the high prices of beef. The fellow who purchased the range man's maturing and finishing land began to think, then to theorize, and finally in some few cases to act.

The result of this combined thinking on the part of the range man and the man who bought his land is gradually shaping itself into concrete form, although the whole proposition is so new that both parties are afraid to draw their breaths for fear their paper house will fall down.

A Scene Which Should Be More Common. Good Herefords on a Diversified Ranch in Yolo County.

The Range Waste and Cure.—First let us see how the situation now appears from a range man's standpoint. One of the largest cattle owners in the State puts it this way: "We have been wasting too much range in our efforts to breed, raise, and finish our cattle on range suitable only for breeding; also we have not utilized as much rough land as would be possible if less maturing and fattening were done on the ranges, and more breeding were practiced. We are annually bringing from other States over 200,000 head of cattle for maturing, feeding, and slaughter; the larger part for fattening purposes. The feed these cattle consume on the range should be used to raise more calves of our own to seven or eight months old, when they should be taken in hand by men better qualified both in land holdings and disposition to properly mature and fatten for the market."

Toward the practical working out of this theory, he strongly urges the use of only good beef bulls—never dairy types—used only between the ages of two and six years. Heifers, he thinks, should not be bred under two years of age, or cows after eight years old. He would replenish his herd by reserving 20 heifers for every 100 cows and sell for feeders each year all dry and old cows above the desired number. He would have his calf crop come during the first three months of the year, February preferably, if climatic conditions warranted it; and would sell his crop of weanlings and yearlings in the fall in time to go into the feed lots of his friends with alfalfa lands. Remember that this is not the writer's personal theory, but that of one of our most successful and extensive range men; and while his mode of procedure may be somewhat different from that of others, it shows the way the wind is blowing among the range owners.

Feeding Has Advanced.—Fine enough for the range men, but where does the small farmer get off? Fortunately, there have been enough venturesome persons among that class to go over the head of theory and get down to actual accomplishment.

Those of our readers who have followed the livestock pages in this journal will remember various articles dealing in detail with results obtained in finishing cattle on alfalfa, supplemented with silage and other feeds. In every instance it has been shown that while most of them were carried out as an experiment, and as a consequence under adverse conditions, the financial returns were satisfactory. But in each case there was a stumbling block that is beyond the feeder; namely, not a large enough supply of well-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau, at San Francisco, for the week ending at 5 p. m. July 13, 1915.

STATIONS	Rainfall Data: Week Past	To Date Seasonal	to Date Normal	Temperature Data: Max'm	Min'm
Eureka	0	.20	.09	66	54
Red Bluff	0	0	0	98	60
Sacramento	0	0	0	92	56
San Francisco	0	.01	0	71	52
San Jose	0	0	0	84	52
Fresno	0	0	0	98	60
Independence	0	0	0	94	56
San Luis Obispo	0	.01	.01	82	50
Los Angeles	0	0	0	84	58
San Diego	0	0	0	78	56

THE WEEK.

Inasmuch as it is practically impossible for anything to happen to the California weather until the September rain clouds heave into sight, it is eminently fitting that the weather-prophets should do up their season's scrapping. And they do not seem averse to it. The great spotlight weather-projector, Father Ricard, of the Santa Clara University, smites hip and thigh his former assistant, Father Albert Porta, who has recently been doing a little storm and earthquake prophecy on his own account. It seems, from remarks credited by the associated press to Father Ricard, that Father Porta's scientific career is itself somewhat over-spotted. These are the quoted words: "The meteorological and seismic forecasts of Prof. Albert Porta, a former instructor in Turin University, are a delusion and a snare. It is a matter of serious doubt whether he knows the difference between a magnet and a cow's horn."—which is as good a metaphorical presentation of a draw-and-thrust fight as one can easily think of. Reading the controversy gives us an impression that Father Porta is something of an improvement on the leopard because he can change his spots and by so doing modify his prophecy, and that gives him rather more freedom than Father Ricard's scientific conscience will allow him to enjoy. And yet Father Ricard's statement itself indicates that spots are not enough, for he says: "Forecasting is not simply a matter of abstract principle, but, above all, one of long experience, and such an experience, too, as is founded on the records of natural facts, showing how to apply principle to a concrete case. Prof. Porta is not, therefore, in any sense a duplicate of the observatory of the University of Santa Clara." This strikes us as very reasonable and it leads as irresistibly to the Macbethian system of forecasting of which the first rule is "out, damned spot!" The less Father Ricard has to do with sunspots and the more he relies upon records of storms and current observations, the nearer he will come to hitting off prophecy aright.

Which Kind of a Cow?

Since readers of this journal (page 12, Pacific Rural Press of July 3) have exalted this writer to the semblance of a cow-prophet, we have ourselves to enter the war-zone of prophecy with as stout a heart as we can muster. A reader, whose note shows that he knows cows and is staking his money on them, and cruelly knowing also what mortal risks we run by answering in the public ear, asks us which kind of a tie he shall tie to, in these words:

To the Editor: I wish to put this question up to you. It may be rather a delicate one, for I realize you are strictly a neutral and may not care to give me just the straight-from-the-shoulder answer that I want. If that is the case I will thank you just the same.

The question of taking up the breeding of Guernseys has been debated by me for some time. I have handled Jerseys for the past six years, having been a beef breeder in Colorado previously to that, and have made considerable by selling bulls. At this time it is almost impossible to sell a Jersey bull calf, and they are rather too small to veal. Will the Jersey likely came back to its popularity, or will the Guernseys supplant them largely? I have sold out my Jerseys except eight head, and I have thought it might be wise to buy a few registered Guernsey cows and a registered bull, and that I would lose nothing by breeding my Jerseys to the Guernsey bull. While I admire the Jerseys, yet the Guernsey has pleased my eye more, but have had no opportunity to learn of their actual merits first hand.—Reader, San Joaquin County.

If we were wise as a judge we would look through this case, find a single point on which a decison could be based, and ignore all other issues which are involved. But prophets are not judges now-a-days, and cannot get out of their troubles so easily. And yet, like a judge, we would say, if you like Guernseys best, breed Guernseys: they are the cattle for you. They are like Jerseys in their distinctively good characters; they are larger and coarser than Jerseys; they have perhaps rather a cooler temperament, the cows less flighty and the bulls better natured. Historically they have similar origin, but the Jersey caught favor first and enjoyed it almost overwhelmingly. Afterwards, however, the Guernsey entered the race for popularity and has made commendable progress, though it is still on a stern-chase. Therefore, if you go into Guernsey breeding for the sale of the stock, you will have to undertake vigorous promotion and constant exhibition to secure the popular recognition of desirability which Guernseys need and which Jerseys already possess. If you are simply growing cows for their dairy product, and you like Guernseys and their grades, by all means indulge your taste. Guernsey sires on Jersey cows may be expected to enlarge the offspring and possibly improve their constitutional strength, if you select your Guernseys for size and vigor and not for pedigree alone, and you will not sacrifice Jersey quality and characters, for the Guernsey shares them. Therefore, as a judge, we hand down a decision that you buy Guernseys—the clerk will kindly see that all fees are paid.

What Kind of a Cow?

But, as stated above, the judge's function is to leave as many things as possible unpassed upon, as we have in the foregoing paragraph. There is a broader aspect of the inquiry, which, as a constituted prophet, we cannot neglect. What kind of a cow does the State need? There is only one kind and that is—a better cow. Everyone who has paid any attention at all to the records of the cow-testing associations which appear from time to time in our columns, must know that California cows are getting better in every neighborhood where testing and rejection are practiced, and that the cows which earn the right to live are pure-breds or grades of the dairy breeds. And this will more and more clearly appear as cow-testing is continued and extended. It ought to be more fully realized that any and all good bulls of the dairy breeds can and do lift their female offspring into the profit-yielding, right-to-live class of milkers—therefore, all the dairy breeds can make of all common stock that "better cow" which the State and the owner need. These dairy breeds are all good to use if you wish to rise from a scrub basis. They differ somewhat in size and capacity, in amounts of milk and fat-content thereof, in economical and efficient use of feed, in adaptation to different kinds of land, and all these points should be considered. The conclusion will be that under certain conditions one breed will be better than another, and, as conditions differ, each breed will be preeminently best and to be preferred for something. Therefore, it is rational that we should have insistent advocates of all good breeds and contention that each of them is best. This is the way progress is made. But when it comes to giving the offspring of common cows the profit-right to live, every dairy breed has done it, is doing it, and will always do it in dairy experience. The owner of scrub dairy cows should be like the lonely spinster who went to the woods to pray for a husband. As she closed her petition a great owl cried, "Hoo, hoo?" "Anybody, good Lord," was her meek reply. So every man who owns a bunch of common cows from which he wishes to grow heifers worth having, should watch his chance to get whatever vigorous individuals of pure dairy breeding his money will secure.

The Relation of the Jerseys to the Question.

What our correspondent says about the slack demand for Jersey bulls is true, and in a way it is the most fortunate thing that could happen for those who wish to make better cows. Just at present fashion has run away from the Jerseys as fast as it ran toward them a few years ago. Both fashions were irrational in their excesses. Although there has been much talk about Jerseys being too finely bred and too strongly fed for record connections, rather than for health and production, we doubt if that charge applies at all to the open-air Jerseys of this State. Besides, the Jersey breeders are not the only transgressors along that line—everybody has been doing it and all will recover. The useful fact in this connection is that the present temporary cheapness of Jersey sires is the best thing that ever happened for better cows in California, if owners of common stock will only seize their chances to get into a good game. The Jersey really laid the foundation of dairy cow improvement in California, because it was the Jersey that first and most widely crossed dairy quality upon the common stock of thirty or forty years ago, which was chiefly Spanish crossed on Shorthorn—tending of course toward beef. It would be hard to estimate the value which the Jersey cross has yielded in this State. One can hardly go afield without seeing it. In two counties, which are leading in California dairying, viz.: Humboldt and Stanislaus, Jersey and Jersey

grades predominate, and their owners are convinced that for economical use of feed in the output of butter-fat and for ability to keep busy eating and secreting the Jersey grades are the cows to bank profits from. We believe that bulls of other dairy breeds are worth the high prices they are bringing and their popularity is earned and deserved, but just now the market for Jersey bulls is such that a buyer can almost get in at his own price, and for those who earnestly desire to have better cows but lack means for large investment, the present condition holds out the chance of a lifetime.

A Trick in the Almond Trade.

A trick which is un-Californian in its spirit and unworthy in its motives has just been sprung upon the almond trade, and the ultimate effect of such action should be in some way retributive upon the transgressor. A San Francisco dealing firm has widely circularized the Eastern trade that it will accept orders for almonds at one-half cent per pound less than the price to be fixed by the Almond Growers' Association, whatever that price may be. The offer has a good stout string tied to it, of course, for notice is given that it may be withdrawn and such orders declined whenever the firm sees fit. The purpose is not price-cutting —which is a legitimate enough recourse when a dealer can stack up things to be advantaged by it. The purpose is to throw discredit upon the growers' association, to demoralize the trade and interfere with the honorable and needful effort of the growers to extend the distribution of their rapidly increasing production. In a way it is a token of the success of the growers' association in their distributive work, which is placing almonds in car-load lots in many markets which have heretofore taken only sack-lots from jobbers in larger cities. This is, of course, not to the advantage of the old-line-dealing trade, but it is essential to success in handling the larger product which the increased acreage is beginning to put forth. But, as we understand it, it is not at all the purpose of the association to interfere with dealers or middlemen, but to make them more busy selling almonds by working for greater popular demand which dealers cannot or will not undertake so widely. The object of the association is to sell more almonds—each year more almonds, so that our largely increased acreage may not produce an over-supply. To serve the purpose of this growing industry, both in the prosperity of the individual grower and the upbuilding of the State, these almonds must be sold at a fair profit above the cost of production. This is no necessary part of a dealer's attitude; he is out to sell almonds at a profit, when he is following his legitimate business, and it is no concern of his as a dealer what it costs to produce them, although as a man he may be as patriotic as any other. The association of growers undertakes to supply dealers all they can handle and help them to handle more and more, and continuously to get more dealers to handle more almonds, but the price must be fair to the grower under the conditions prevailing. When, then, a dealer tries to place a bomb under this beneficent institution, in the form of a sensational gambling announcement, merely for the purpose of discrediting the growers and demoralizing the trade, so that he may run away with something from the wreck which he tries to create, he is bringing disgrace upon legitimate trade and is trying to betray the State. The lesson to growers in the working of the disgraceful trade trick to which we allude, is very clear. It should convince them that it is essential for them to enter more widely and strongly into the support of an organization of men of their own producing class, which is working constantly and successfully to open new outlets and multiply demands for their product, at prices which will fairly reward them for their investment and labor. If growers are to realize anything from their rapidly increasing output, they should stand solidly against all dealers' tricks and not be upset by them. They need not fear legitimate dealers' interests; they can all be advantageously used, probably, in the distribution of the product. But when a dealer circularizes the trade with a stringed offer to cut a price before any price has been fixed, and before he can possibly know whether such a price is warranted by conditions or not, it is not even fair gambling or speculation; it is a trick to befuddle and destroy, which even its originator should be ashamed of.

Queries and Replies.

Querists must give name and address.

Roots of Swiss Chard.

To the Editor: We planted some Swiss chard and it has grown like a house on fire, and is wonderfully pretty to look at. I have cooked it like spinach, in its own juice, also with pork, and both are nice, but what can I do with the roots? They taste splendid raw. I am cooking for ten people, and have tried lots of recipes out of your paper, and they are good.—The Cook, Lemoore.

It has been one of the supreme efforts of our life to keep on good terms with the cook and we are grateful for this token of success. Swiss chard is simply a beet which has been developed for esculent foliage and leaf-ribs and stems instead of for esculent roots, as other varieties of the same plant have been. Naturally a plant is best in those uses for which it has been developed by generations of selection and effort. Therefore if you get top growth good for eating in a chard you should be content to throw the root away—just as in a beet you throw the top away when you use the root. The chard root is manifestly inferior to the beet root. Still if your conscience pricks you for throwing it away, just boil up a lot of the roots in your beetingest style and watch through the crack of the door what your ten boarders do with it. Cooks have done that before: it is perfectly legitimate research work in cookery. In our records from countries where chard is most largely grown we do not find mention of the culinary use of the root. It is just possible that superior growing conditions in California may cause the plant to make a better root here than elsewhere.

Treatment of Walnut Grafts.

To the Editor: I have some black walnut trees which were grafted to English walnuts this last March. The grafts are growing so rapidly that I find it impossible to keep them staked. Would you advise cutting them back? If so, how much?—J. E. B., Durham.

It is of course better to top-off the graft than to have it blown out, and in grafting on old stumps it may be desirable to cut back the growth for two years or more until the healing tissue at the graft has a chance to harden and strengthen well. Where the growth is not very heavy it can often be sufficiently supported by nailing two or three laths around the old stump, allowing these to extend say two-thirds of their length along the grafts and tying around laths and grafts with bale rope. In supporting tall growth from grafts in young stocks, both stock and graft can be tied to a good stiff stake. It is not necessary to have the stake chase the new growth. If you can get one strong tie around the stock and two ties around the graft, it will sustain the joint well and the newer growth above can take care of itself, if all is stiff and strong below. Young grafted trees should be allowed to run out long growth to get sufficiently high heading. Laterals usually appear plentifully the second year and can be used in shaping the tree. If, however, such treatment seems to be too much trouble or expense, protect the joint by cutting back above to check the run-out. This must be according to judgment: there cannot be any particular rule about it.

Bermuda on Reservoir Bottom.

To the Editor: I have a reservoir covering an acre which has a complete sod of Bermuda grass in the bottom. What would your idea be of the most practical way to get rid of it? Could it be done with distillate?—Subscriber. Kern county.

Do you wish to remove the Bermuda so that you can work the soil bottom to make the reservoir hold water? If so, under-cut the sod with a weed-knife or flat-tooth cultivator, dry-rake into windrows and burn and then get on with your harrows, clay, sheep, etc.—whichever you choose to use to puddle the bottom. If you wish to kill the top-growth, distillate will do that but it will not get to the bottom of the Bermuda. It will come up again when it gets ready, providing the surface has air and light. But if it is simply a question of killing the Bermuda on the reservoir bottom, why do you worry? Fill the reservoir and that will settle it. Bermuda is not an aquatic plant. It will probably climb out over the banks but that will not be a bad idea: it will keep the banks from washing.

Olives on Check Borders.

To the Editor: Do you think it would be practical to plant olives on alfalfa borders here? The soil is gunshot-sand and seeps freely. Borders are 2 rods apart.—A. T., McFarland.

If the soil is deep and open so that surplus water will sink and not stand and the levees are not high enough to dry out too much, the olives will be all right. If they have to grow in mud puddles or to be stranded on high, dry and weedy levees, they may not amount to much. It all depends upon whether the trees get enough and not too much water.

White Gnat on Beans.

To the Editor: For two years I have been annoyed with a sort of small white gnat with wings, that completely destroy the bean vines, and so far have been unable to kill them in any way. Would you kindly advise me of some way to destroy them.—Subscriber, St. Helena.

We can only make a rough guess at what you have. Why did you not send specimens? There is a "white fly" (Aleyrodes) which often attacks beans, and it can be killed by good spraying with kerosene emulsion or tobacco extract. But how can we tell whether you have this pest or some other?—Editors.

Fruit Crop Prospects Reduced.

[Written for Pacific Rural Press.]

Fruit blossom estimates of crops have been considerably lowered, as usual and as expected, by the various agents such as frost, wind, wetness, disease, and insects. The season is ten days or two weeks behind, on account of the late rains and cool weather in general all over the State. This was responsible for much injury due to fungi and aphids of all kinds which have been general and are not yet out of the way in some districts.

The shot-hole fungus of which so much was said in regard to the southern Sacramento valley and foothills, has been of general injury to most deciduous fruits, apricots and almonds in particular, with more or less damage to prunes, plums, and cherries. In the southern part of the State they are beginning to think that the so-called shot-hole fungus of apricots was in reality another fungus which causes a thick scab on the fruit.

Black scale has been generally bad throughout the State, though many orchards of southern California where it was especially bad last year, are clean this season, seeming to indicate a natural control. Such natural control has not been found in San Joaquin county, though spraying is effective.

Locusts or grasshoppers are very bad in many parts of the State, especially Imperial valley and north Sacramento valley.

In California, the almonds have been somewhat injured by wind, but in the central part especially by the shot-hole fungus. Red spider has hurt them in the north Sacramento valley, but not enough to seriously reduce the crop.

The production of apricots in California is decreasing, especially those for shipment East, largely on account of the damage due to shot-hole fungus, which a few years ago was found only on light, sandy soil or higher ground, but it has now spread over the lowlands as well. Very little of the injured fruit is shipped, so it has not affected the markets, but it has reduced the amount that could be shipped. A high authority claims this is a good thing because when a great deal over 100 cars per year are shipped East, the prices are lowered beyond the profit line. The same fungus is likely to appear next year if weather is favorable because spores may be seen even now on the trees.

The citrus gray scale which was discovered about seven years ago by Mr. Essig, then a student at Pomona College, and which was fought under county auspices in Tulare county last season against vigorous protests of the growers, is now serious in practically all of the citrus sections of the State, and the growers who protested against fumigation last year are eagerly asking for it now.

In San Joaquin county, the gray fungus which is affecting grapes is also found on their citrus trees. Sacramento county reports a full setting of oranges.

The Tokay and Malaga grape crops for the State are estimated at about 65 per cent. Phylloxera has been spreading very slowly and has not much to do with the reduction; nor has mildew gotten ahead of the growers very much, though in many cases several sulphurings have been applied. Many of the Tokay and Malaga shoots which ordinarily put forth two bunches, this year have only one bunch, and the crop on the old vines is only about 50 per cent of last year; young vines bearing more heavily, bring up the estimate. Emperors are about a three-quarter crop, which is better than the short crop of last year. It is expected that all table grapes will show fine quality. Two troubles in San Joaquin county are responsible for much of the Tokay reduction. One is the gray fungus which weakened the buds early in the season, and it is noticeable that the heavier crops are where a fungicide was applied early in the season. The beetle of the grape root worm has become serious this year for the first time, especially in San Joaquin county.

The 100 per cent olive prospects reported to us at the blossoming time about a month ago are now greatly reduced by non-setting, partly due to starving of the buds by the black scale and partly, as reported from Tehama county, where one-half crop remains, by the damp cold spring followed by three weeks of dry north wind. Sacramento county reports 80 per cent.

Of peaches there is practically a full crop throughout the State. In Placer county the early peaches ripened quickly when the weather warmed up while they were still immature; thus below normal sweetness and size.

The pear crop seems to be less than three-quarters for the State, though early Bartletts are a heavy crop and have been shipepd for nearly two weeks from the Sacramento river section.

Many of the orchards still show "burnt" twigs as the result of neglect of blight, or careless cutting. One large orchardist has had three men busy cutting out blight all winter and now he has one man doing nothing all the time except to keep the newly infected twigs cut out. On account of his care in this respect he has a tremendous crop. Blight, which was alarming in Solano county early in the season, has been well cut out and the situation is well in hand. Thrips were not so bad as feared on account of persistent spraying, but are likely to be bad next year, as larvae are even now to be seen in the trees. Many pears are russetted in Contra Costa, Sacramento, and Solano counties, being worst where the thrips were most numerous. Pear blister mite has done some damage in El Dorado county, while Mendocino reports injury by rain while the fruit was in bloom.

For the State in general, plums are about a 90 per cent crop, Tragedys being rather short but mostly already shipped. Late varieties are a full crop most everywhere. The early ones in Placer county were immature when the warm weather forced their ripening under-size and under-quality.

Prunes in Santa Clara county are beginning to show up to some extent, but even the best crops are lighter than last year. Aphids are still serious. In Tulare and Solano counties, prunes are reported not over 60 or 65 per cent.

Southern California claims full crops of walnuts in spite of the blight being "awful bad" especially in Santa Barbara and Ventura counties. This is possible on account of the tremendous setting. New Humboldt plantings are doing well.

BEARING ACREAGE IN PER CENT OF STATE TOTAL AND PRESENT CONDITION.

Special Reports to Pacific Rural Press from County Horticultural Commissioners, Subscribers, and Our Men in the Field.

Spraying Time

and there is no better spray than

Scalefoe

Not only for scale but nearly all insects, worms and bugs that infest plant life. It has been killing them for 15 years, giving the greatest satisfaction without injury, but positive benefit, to the plant. Send for our circular of testimonials or better, try it.

Gallon can, 50c;
5-gal. can, freight prepaid, $2.00.

Must be mixed 20 parts water to one Scalefoe before using, making it very cheap. Write for prices in barrels delivered at your freight station.

Program State Fruit Growers' Convention

The 46th California State Fruit Growers' Convention will be held at Stanford University, Palo Alto, July 27 to 30, and at the Exposition July 31. It will include the first annual meeting of the West Coast Potato Association July 26 and 27, and a conference of County Horticultural Commissioners July 26 and 27 at Stanford University.

Tues., July 27.—7:30 p. m. The outlook of: Pomelo, R. S. Vaile; Prune, E. N. Richmond; Walnut, J. B. Neff; Apple, J. B. Hickman; Apricot, F. B. McKevitt; Peach, F. P. Roullard; Grape, F. T. Swett.

Wed., 9 a. m.—Pear Culture, R. H. Parsons; Control of Pear Blight, E. A. Gammon; Blight Resistant Roots, A. L. Wisker; Pear Outlook, Percy Gammon; Bee Culture, Mrs. H. C. Acklin; Growing Nursery Stock as a Business for Women, Mrs. L. E. Sexton; Developing an Apple Ranch, Miss Vida R. French.

Wed. 1:30 p. m.—Codling Moth, A. L. Melander; Blight Resistant Pears and Pear Stock, F. C. Reimer; Sub-Tropical Fruits of Promise in California, Prof. L. D. Crawford; Grower as Experimenter, E. S. Thacher; Women as Florists, Mrs. Myrtle Shepard Francis; Farming for Women, Mrs. Emily Hoppin.

Wed., 7:30 p. m.—Plant Quarantine Service, C. Gordon Hewitt; Experiment Station Movement in America, S. B. Doten; The Lure of the Garden, Mrs. Myrtle Shepard Francis.

Thurs., 9 a. m.—Almond Outlook, G. W. Pierce; Why I Planted an Almond Orchard, Miss C. A. Whelan; Cover Crops in Citrus Culture, C. S. Vaile; The Interrelation of Soils and Crops, J. G. Lipman.

Thurs., 1:30 p. m. — Automobile trip through Santa Clara Valley.

Thurs., 7:30 p. m. — Birds and Mammals Injurious and Beneficial to the Farmers' Interests (Lantern), H. C. Bryant; The Olive, W. F. Oglesby; Olive Outlook, B. B. Meek

Fri., 9 a. m. — Orange Outlook, J. H. Reed; Lemon Outlook, G. W. Hosford; Composition of California Oranges, E. M. Chace; Co-operation in Fruit Marketing, H. G. Johnson; Careful Handling of Fruit, C. S. Milliken.

Fri., 1:30 p. m.—Uses and Misuses of Infectious Diseases and Insect enemies for the control of Insect Pests, A. W. Morrill; How a Farm Woman Found Herself, Mrs. Emily Hoppin; Proportion Between Hunger and Food Supply, Prof. G. J. Pierce; Eel Worm Parasites on Plants, Prof. Peter Frandsen; Canning and Selling Fruits and Vegetables, Mrs. Sara Roberts; Canning Poultry and Meats, Mrs. Belle S. Corey; Scientific Jelly Making, Mrs. Hilda B. Neilsen.

Fri. 7:30 p. m.—The Railroad and the Potato Industry, W. H. Olin; Citrus Culture, Dean H. J. Webber; Maintenance of Soil Fertility, Prof. W. E. Kelley.

Sat., 7:30 p. m., at Exposition.—Mutual Indebtedness of Science and Agriculture, John M. Coulter; Present and Future Supplies of Commercial Plant Foods, J. G. Lipman.

On the Potato Association program are the following which are open to all interested:

Mon. July 26, 1:30 p. m.—The Tuber Moth in Relation to the West Coast Potato Industry, E. O. Essig; Discussion by representatives from various states; Associations and the Potato Industry, R. W. Faulkner; A New Thrips Enemy of the Potato, D. L. Crawford.

Tues., 9 a. m.—Value of Potatoes as Food, Miss Lillian D. Clark; Seed Potatoes, W. V. Shear; Varieties of Potatoes, Mrs. Hilda B. Nielsen.

Tues., 1:30 p. m.—Need for Experimental Work with Potatoes, E. H. Phreaner; Fertilizing Potatoes, W. Q. Fitch; Fundamentals of Success in Potato Growing, E. H. Grubb.

Tues., 5 p. m.—Discussion of interstate quarantine, for the prevention of the spread of potato diseases, the seed potato problem and the poisoning of the soil by the planting of diseased potatoes. All interested are earnestly invited to be present and take part in the discussion.

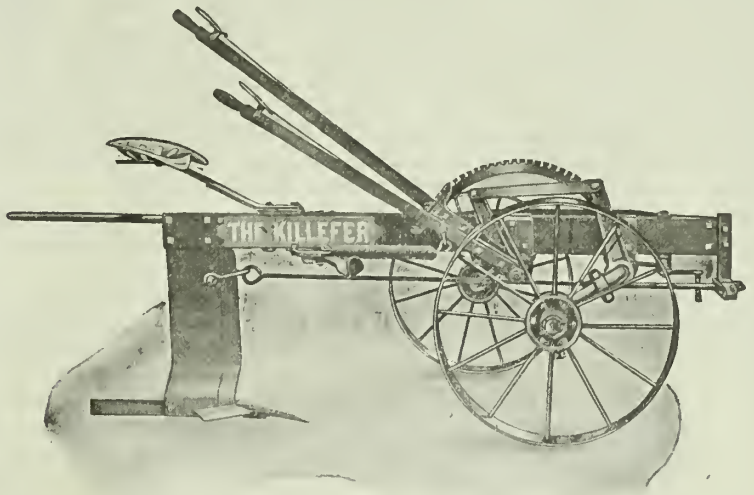
Special Meeting, Wed., 5 p. m.—The proposed new State quarantine order, which will set aside the county quarantine ordinances now in force, will be read and discussed. Every nurseryman, county horticultural commissioner, fruit grower, etc., whose work is affected by this order, should certainly be present.

OPTIMISTIC FRESH FRUIT SHIPPERS.

[Written for Pacific Rural Press.]

"We'll all smile when the fresh fruit season is over," says a big fruit shipper. "Good quality fruit has sold as high as ever. California is too big and too diversified to go through any season without some discouraging crops or prices, but she is also too big to suffer severely by whatever low prices or small crops exist this year. There never was a poorer quality of fresh fruit of all kinds shipped East than has been so far this year. It has contained very little sugar and color, and as a consequence has kept rather poorly; but we expect the grapes and late pears to be of fine quality and good price. The trade in the East is looking forward to the appearance of the standardization law when they can depend more on honesty of pack than before, thus reducing risk, uncertainty, and high margin of charges for handling the fruit. Late peaches will not be so low priced as anticipated because the season is 10 days late and Texas peaches will be out of the way when the earliest Elbertas come in. Georgia peaches will be out of the way before our north Elbertas come in."

"Prospects for good prices are poor until along in August," says another shipper. "The East has had the biggest crop ever and it has been good quality, while at the same time the weather has been discouraging to fruit consumption."



"We have no bumper crops and are shipping little or no bad fruit," suggests another, "so that prices will be better later on. Grapes especially will benefit by the standardization law."

"By our new system of distribution, we hope to have a broker in every small city and spread California fruit more widely than ever before," says another. "If we can sell 75 per cent of our fruit to districts outside the auction cities and thus send only 25 per cent to auction, we will certainly raise the prices there and thus furnish the basis for higher prices f. o. b. In regard to shipping plums, the time is sure to come when the Japanese varieties must drop out. They have a characteristic flavor which is not pleasing to eastern consumers. The East likes European varieties, but cannot grow them very largely on account of curculio which causes the fruit to drop."

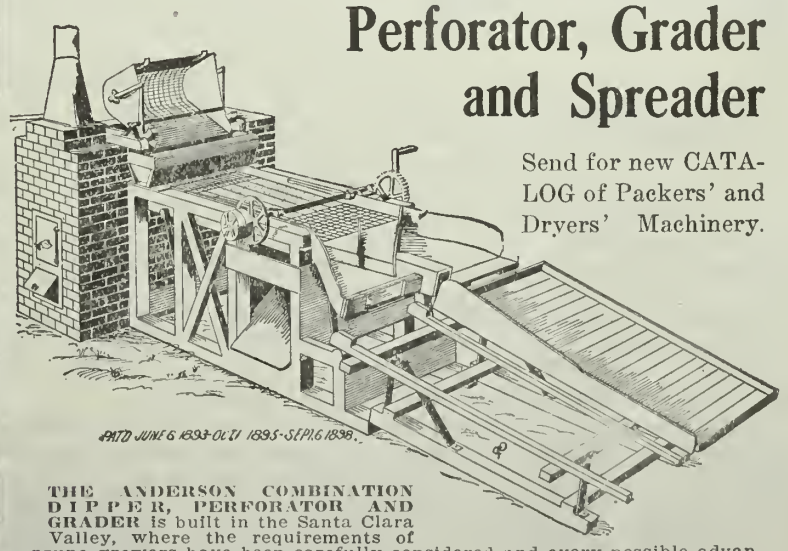
One Row Beet Plow

KILLEFER QUALITY

KILLEFER EFFICIENCY

Was designed for the smaller grower where horse power was not available for handling the larger two-row plow. The draft is very light and no more weight has been used than was necessary to give the proper strength.

The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.



We build this plow with either straight, sloping or bent standards and with any style of wing or point required.

The Killefer Manufacturing Company

Meeting Foreign Walnut Competition.

[Written for Pacific Rural Press by Carlyle Thorpe, Mgr. California Walnut Growers' Ass'n.]

Many of the California growers have the impression that good walnuts cannot be raised in any other section of the world than here at home. It is possible to raise just as good walnuts in France or Italy as in California.

Our people have perhaps been more progressive in the line of developing new and better varieties of walnuts and of placing them on the market in better condition than do our foreign competitors. In recent years the importers of walnuts have realized the advisability of securing a better pack. They have prevailed upon foreign exporters to ship a more carefully selected grade and the average quality of deliveries of foreign nuts has been improved each season.

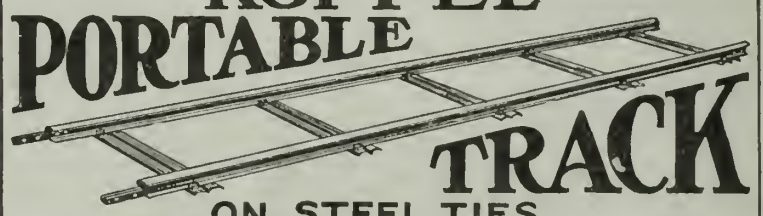
The trade generally consider the California walnut the best on the market and are even willing to pay a premium over all foreign varieties for our best grades. This condition will prevail only so long as our growers continue to be leaders in their producing and packing methods, and thus deliver a grade of nuts which our foreign neighbors cannot equal. Being firmly convinced that in the maintenance of the highest possible quality lies the success of the California walnut industry, the California Walnut Growers' Association is spending thousands of dollars annually in the development of better methods in grading and packing its product; and is lending every encouragement to the further development of better varieties of walnuts. We believe that high quality pays better dividends than any other feature of the business.

Growers' Advertised Brand.—The California Walnut Growers' Association, early realizing the importance of maintaining a uniform high quality, adopted the Diamond Brand, under which only selected goods would be shipped. Owing to our rigid insistence that only the best nuts be packed under the Diamond Brand, we have developed a demand for our goods far in excess of our expectations.

Our shipments have now become completely standardized. We can and do guarantee to our customers a high quality by naming a fixed cracking standard each season; we guarantee against shrinkage on arrival; we guarantee the sizes of the various grades; and have adopted many other uniform provisions—thus eliminating the hazardous risks formerly prevalent in the business. We employ a corps of inspectors who carefully examine and make a cracking test of each shipment before it is permitted to go forward; and the grading and other equipment in the nineteen packing houses from which we ship has been made as near uniform as possible.

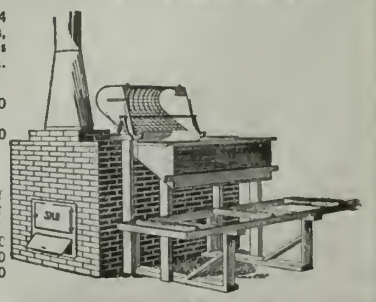
Holiday Advantage.—The average consumption of walnuts in America during the holiday period, October, November, and December, is thirty-seven to forty million pounds. The strongest demand for walnuts is for early October shipment. The trade in this country insist on securing their deliveries in ample time for distribution for the Thanksgiving trade. Even in normal times, few, if any, foreign walnuts can possibly reach America for the Thanksgiving trade. This year, the European countries producing walnuts being at war, with much of their labor fighting, their railroads in the hands of the military, and trans-Atlantic steamship service more or less demoralized, it can hardly be expected that walnuts in quantity from Europe will arrive even in time for the Christmas trade. Seldom do over 20 per cent of the so-called Manchurian walnuts reach America in time for the Christmas trade. It can readily be seen that the California growers have a decided advantage in being the first on the market with their product.

It should not be inferred from this that record-breaking prices will prevail. If the crop develops in harmony with present indications and with the present almost unanimous sentiment of the growers in favor of an immediate cleanup without a carry-over, prices must necessarily rule at a figure which will show all handlers of our product a reasonable profit and one commensurate with their efforts to push a larger-than-usual volume of walnuts into the hands of the consumers during the two or three months around the holidays.



The trade in this country well know the comparative value between California walnuts and the various foreign varieties. With the annual consumption of walnuts in this country averaging about sixty million pounds, there will always be a good market for every pound of high-class walnuts grown in California. The principal competition is the French and Italian and the so-called Manchurian walnuts in the order named. The Italian walnut known as the Sorrento variety is undoubtedly our strongest competitor in quality, but the available quantity is comparatively small. France ships by far the largest quantity of any foreign country, their imports usually about equaling the total California crop. There are no walnuts grown in Manchuria, the so-called Manchurian walnut being produced mainly in the Shantung province of China proper. The better varieties of these are cultivated, but the poorer qualities grow in a semi-wild condition. As a general rule the Manchurian walnut does not displace to any perceptible extent the better grades of California walnuts, the market for the Manchurians usually finding an outlet which it would be impossible to develop for our line.

Excessive Prices Curtail Consumption.—Summing the whole foreign competitive situation up, it is safe to say that as long as the California growers continue to develop their quality and pack to the extent that they can maintain the leadership in quality, there will always be a ready market at fair prices for the entire California production, but let us not forget that excessively high prices certainly curtail consumption as is evidenced by the decrease in consumption of about 33 per cent during the season 1914-1915 over the few preceding years. Growers will therefore do well, in forming their idea of prices, to consider carefully the probable outturn of the California crop, the competition to be reasonably expected from abroad and the purchasing power of the ultimate consumer.



BORAX FOR LEMONS.

Answering several inquiries, no one in our office has ever heard of using borax to cure lemons. C. C. Teague of the Limoneira Ranch writes he has never heard of curing lemons with borax.

Lemon Shipments Increased.

[From Citrus Protective League, Los Angeles.]

The remark is sometimes made that the consumption of lemons has been nearly stationary during recent years. The data below, however, show that the 1914-15 estimated supply of 156,889 tons exceeded the average supply during the five years 1900-1904 by 49,519 tons, or 46.1 per cent. This increase in the supply during about fifteen years is equal to about 3,300 carloads of 30,000 lbs. each. The proportion out of the total supply which was shipped from California increased from 26.7 per cent in 1900-04 to 48.5 per cent in 1914-15.

For the information of our members we have brought together the following data showing the supply of lemons in the United States for three 5-year periods and estimated supply for 1914-15. The years end June 30.

5-year avge.	Imports tons	Calif. shipments tons	Total tons	Pct. increase over last 5 years
1900-04	78,750	28,620	107,370	
1905-09	74,531	52,963	127,494	18.8
1910-14	80,942	63,812	144,754	13.5
Year 1915-15	80,803	76,086	156,889	8.4

PRUNE GROWERS' COMMITTEE.

The inability of some growers of apricots to dry their products has led a few of them to sell green at prices lower than seems justified. Indications are that when the crop is harvested there will be an active and continued demand for good quality dried apricots. One member of the committee already has inquiries for many carloads of dried apricots for France, although those interested in bearing the market insist on Germany being the only available outlet.

In regard to prunes we can see no reason for changing our previous estimates of production. As to prices and market conditions we desire to reiterate our previous statements as to short selling by certain packing interests and the need there is for the growers, as a whole, to continue to hold firm for a living price. It is with pleasure we note the almost universal determination of the growers to hold for the 5c basis which they feel to be the lowest price at which this season's crop should be sold.

We desire to state that inquiries are coming in from buying sources for prices and terms for shipment to England and France to such an extent as to show that the claim as to inability to export is false.

Do you realize, growers, that it would take only 4 or 5 ships of ordinary cargo capacity to carry to Europe the entire share of our prune crop which it is advisable to sell to Europe? This seems to rather turn the light of ridicule on the statements as to inability to export.

I. H. BONE, Chairman,
H. H. SHELLEY, Sec'y.

ORANGE TREES UNTHRIFTY.

To the Editor: The new leaves on my orange trees that came out in the spring are curled. Does the fruit drop more when the trees are young? My trees are five years old. I have not gotten any fruit worth speaking of from them so far. I have two trees that did not put a new growth. One had quite a bit of bloom, but they did not mature and now both trees look as if they are going to die. Do you think nitrate of soda would bring them out?—Subscriber, Exeter.

[Dig two or three holes close to your trees about 3 feet deep and if you find much marly or limey substance, that is probably the trouble. If not, and if the soil is well drained but not dry, we would try nitrate of soda or stable manure. Notice whether there are scales or other insects on the twigs or leaves. The drop is not heavier on young trees than older.—Editors.]

WANTED!

Myrobolan or Cherry Plums

Will buy in large or small quantities. The Plums to be used for seed and can be accepted in any condition just so the seeds are intact. Reasonable prices offered. Communicate at once with **Box 91, Loomis, Cal.**

WESTERN CITRUS AUCTION.

In regard to selling citrus fruits at auction in the West, C. C. Teague of Ventura county mentions the following points: It is largely the greatly increased production that has taxed the marketing facilities for citrus fruits and has, therefore, stirred up more or less dissatisfaction with the existing market facilities.

It is this same large production that would prevent the eastern buyers of citrus fruits from going to the expense of maintaining agencies in California to buy the fruit and then undertake all the risk of transportation, and eastern weather which might discourage the consumption of fruit. Rather than undertake such expense and risk, they would sit back, and pretty soon independent shippers would be shipping their fruit to them on commission and then the market would be broken.

Moreover, under conditions of such heavy production, it is vital to the industry to use every available means of placing the fruit in the consumers' hands and stimulating consumption. The organized growers to whom the increased consumption of oranges and lemons is vital, must put out the necessary efforts to distribute the fruit economically to every available market and to stimulate the consumption. It doesn't make so much difference to the dealers, and they naturally would not push oranges into consumption with enough vigor and persistence.

AVOCADO OR AHUACATE?

Avocado growers have organized into the "California Ahuacate Association." In answer to our question reagrding the name, Acting Secretary H. W. Hazzard of Los Angeles writes:

"Aguacate is the Spanish Royal Academy's adoption. Our word is nearer the original Aztec in spelling and gives us the same pronunciation as the inhabitants of the countries in which the fruit is now of such vast importance as a food.

"Ah-ua-ca-te is the phonetic spelling of a name that has a legitimate ancestry. Avocado is not a name but the past participle of the verb 'Avocar,' not applicable as the name of the most valuable food product of the soil."

A well known fruit grower of the San Joaquin writes us in this very appreciative way: "I venture to say that I consider the Rural Press the best edited agricultural paper in the United States. Your advice and suggestions from time to time are timely, practical and sound."

INSURE YOUR SEED

Get a "catch", a good stand, and a big yield of ALFALFA, BEANS, Peas, Vetch, and *all other Legumes*—inoculate with

DEEP WELL ORCHARD PUMPING.

[Written for Pacific Rural Press.]

Jos. Wolf of Santa Clara Valley irrigates 27 acres of fruit twice a season and supplies water for several of his neighbors, some once and some twice per season, with a 12 h.p. gasoline engine and a Pomona deep well "10 h.p. head" pump. The well is 206 feet deep and 12 inches in diameter, having a casing all the way down which is perforated at the different water-bearing strata. The pump reaches down 168 feet, but the water level is so constant that only an 83-foot lift is required at any time. Mr. Wolf has run the outfit a week, day and night, without stopping, but there was no difference in the water level.

"If I had an electric motor instead of a gasoline engine, I could lie down and sleep by it, for the deep well pump makes no noise at all." Everything about the pump runs on wheels and the whole thing stands on a solid concrete foundation. When running full capacity, it delivers 300 gallons per minute; but it is usually run only about 260, because slow motion as a general rule is beter for machinery. When one of the plungers is rising slowly with a load of water, the other plunger is descending inside of it and enough faster so that it fills up again before the first plunger has reached the top, rising again while the other descends, thus delivering a practically continuous stream of water.

"When I was paying 8½ cents for distillate," says Mr. Wolf, "it cost 90 cents to run the engine and pump 10 hours, plus 35 cents for lubricating oil. I am getting distillate now at 6 cents. The pump complete and set up cost me $950. I would much prefer a 260-gallon stream to 800 or 1000 gallons. I observed one of my neighbors last year rushing through his irrigation because he thought it was too expensive to buy water, while another one divided a stream of 300 gallons a minute into two checks at a time to get a very slow stream and thus soak in lots of water. There is no use taking the trouble and time to check for irrigation and then get on only half enough water, just because it costs less."

TRACTOR POINTS TO LOOK FOR.

[Written for Pacific Rural Press.]

"No tractor so far as we know includes all the points mentioned below. However, each buyer will have to select the one that is most suitable to his particular class of work.

Gearing. — "The most common method of transferring the power from the engine to the draw-bar is through a clutch and a set of gears and differential to the wheels. In order to start your tractor, you pull out your clutch and put the proper gears in mesh and then gradually pull the clutch back and you start off slowly. In this type, the change gears either slide on a shaft or else are operated by means of a cam.

"With the sliding transmission you simply release your clutch and slide the proper gears into mesh and when you let the clutch back you start off at the proper speed. To facilitate the meshing of the gears the teeth of the gears are beveled so that they will mesh easily. This is the most suitable type where you require a large range of speed. Bear in mind that in all tractors the engines run at nearly a constant speed.

"With the planetary type the gears are always in mesh and you obtain your change of speeds by simply stopping one unit of the transmission. No gears to change and you avoid the chance of breaking gears that might happen in the other types if your clutch might be dragging. This type is the simplest of all to operate.

"For quick turning and handling heavy loads you can do away with the differential and in its stead use two extra clutches, one on either side. This enables you to stop one side of your tractor and let the other go ahead. There is one type that not only stops one side of the tractor as above but in addition can reverse one side, thus you are going ahead with one side and backward with the other. This requires a double planctary transmission, one on either side. These tractors can spin around like a top," says G. W. Gibson of Colusa county.

Most Direct Drive.—With a given horse power in the engine, a tractor delivers greater or less power at the drawbar according to the number of gearings used between the engine and the actual driving wheels. All machines must be high enough from the ground to ride over uneven surfaces and high ridges in the road, so it becomes necessary in many machines to transmit this power to the

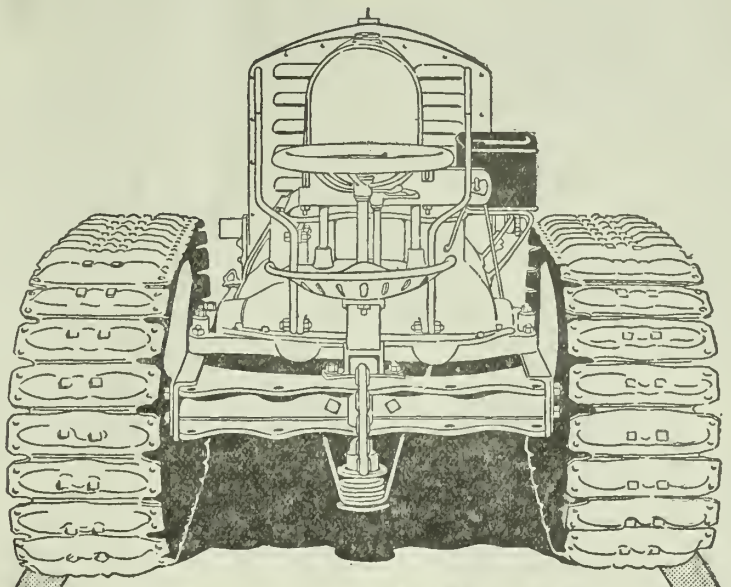
READ-MILLER CO.

wheels through a series of gears or chain sprocket wheels. One tractor minimizes this and claims to deliver 16 h.p. from a 30 h.p. engine by running the driver shaft direct to the track, raising the returning part of the track high enough to run over it without any secondary transmission. Another machine which uses a chain and sprocket in order to deliver the power from the engine down to a driver gear running close to the ground, is claimed to deliver only 14 h.p. from a 30 h.p. engine.

Soft Ground.—The amount of ground on which the weight of the machine actually rests determines largely its ability to plow soft land, patches of which are found on most any farm even when plowing in general is good. The weight of track types does not rest on the entire space on which the track rests, but mostly on the space directly under and between the wheels on which the weight of the machine rests, and which run on the track. In the round wheel types the bearing surface is increased by additions to the width of the wheels and by contrivances such as grousers or open work permitting the wheels to engage more dirt. The more surface the engine rests on, the less pressure per square inch.



A machine in which the power is delivered to the tracks by means of a driver of large diameter delivers less of its engine horsepower to the drawbar than one whose power is delivered by means of a driver of smaller diameter; on the same principle that it is easier to lift a shovelful of dirt by taking hold of the handle close to the shovel than it is by taking hold of the end of the handle.

Oiling, Vibration, and Highway Damage.—Oiling systems also must be considered when selecting a tractor. A machine whose working parts are open to dirt or are so tightly closed that inspection and reoiling are difficult and are likely to be neglected when needed, would be an unsatisfactory type unless other points in its favor are included. One machine puts all of its transmission into an oil-tight steel box and fills that box with 185 pounds of cup grease and 10 gallons of good lubricating oil. The transmission churns this mixture into a thick, creamy fluid which retains its lubricating ability for about a year. Such an arrangement avoids the necessity of worrying about dirt getting into it or about its getting dry. Annual cleaning and refilling are not likely to be neglected. Force feeds of various kinds are to be commended.

The absence of vibration when the engine is running but the machine is standing still is pointed out as a distinct advantage by C. J. Johanson of Madera county, because excessive vibration loosens bolts, causes extra wear on revolving parts and when anything becomes loose, hastens destruction.

Use of a machine on a highway is sometimes forbidden because of its cutting them so badly. It is desirable to provide against this contingency also when purchasing a machine if it is likely to be used that way.

The total arivals of hay at San Francisco for the week ending July 10 were only 3100 tons as against about 4500 tons each week for the last few weeks.

simplified control

Simplified control—everything at the operator's finger-tips—so easy that a twelve-year-old boy can handle a Yuba Ball Tread Tractor as effectively as a man.

No need to throw all your weight onto a lever to shift gears or throw in the clutch. No snap and bang as the lever goes over. Every operation is performed quickly, quietly and easily as in a high-grade automobile.

Either the hand or foot throttle is used to regulate the speed of the motor. A set spark is used.

THE YUBA BALL TREAD TRACTOR

Only two sets of gears are used for speed—high and low. Gears are shifted by a handle on the transmission case directly in front of the seat.

Each tread is controlled independently. The levers on either side of the steering wheel send the tractor ahead when shoved forward. Pull them to the rear and the tractor is sent backward.

The Yuba Ball Tread Tractor steers as easily as an automobile. No worm gear is used.

It takes but a few minutes to learn how to operate it.

There is a booklet describing the rest of The Yuba Ball Tread Tractor.

General Agricultural Review.

GRAPES AND SMALL FRUITS.

On July 7 Brawley shipped the first Thompson Seedless grapes to the Chicago market.

Large shipments of Himalaya berries are being made from Greenfield, Monterey county.

It is now unlawful for any one to sell raisins unless the variety of grapes from which the raisins are produced is marked conspicuously on the package.

That the demand for ralsins this fall will equal that of previous years is the opinion of Wylie M. Giffen, president of the California Raisin Company, as a result of investigations on a recent trip East.

DECIDUOUS FRUITS.

A shipment of 8 cars of canned fruit was made by Libby, McNeil and Libby from Selma July 10.

The first full carload of fruit from Auburn was shipped by the Producers' Fruit Company July 3.

The first Bartlett pears this season shipped from Loomis by the Earl Fruit Company, left there on July 1.

Canned prunes and canned olives are being quoted this year for the first time in the standard list of the California Fruit Canners' Association.

Civil service examinations for packed-apple inspector at Watsonville in accordance with the apple standardization law recently approved, have been called for July 21.

A fruit grower of the Berryessa district in Santa Clara valley says that two-thirds of the apricot growers in his section are holding apricots for 8 cents in spite of the fact that they have gone down recently.

A tax of ¼ cent will be levied by the California Green Fruit Association on each package of green fruit sent out by its members this season. The money obtained will be used to promote their common interests.

To devise means of enforcing the new standardization law, which becomes effective Aug. 9, horticultural commissioners from four counties adjoining Fresno have been asked to meet at Fresno to confer with the green fruit packers.

Bartlett pears have been shipped from the Sacramento River district since early July. They were going forward surprisingly green, but will probably at least soften on the way, though development of flavor and sweetness is rather unlikely.

On account of the prevailing cool summer delaying ripening, green fruit packing houses are having a most peculiar season. The Visalia canneries were scheduled to open July 15, but the date has been postponed to July 20 or 21, the latest date of opening in the history or the county. The Stockton cannery will soon begin canning peaches.

"There is absolutely no sense in selling dried fruit before it is dried." said a fresh-fruit shipper recently. "The dried fruit operators could and ought to co-operate to the extent of holding up the prices on dried fruit to a level where the growers would get a fair return, the packers would get a fair profit, and the consumers would not be called on to pay enough extra price to influence the consumption. It is a certainty that consumers' prices will go up; if not in this way, then because producers will drop out of the game until scarcity raises the prices; so shippers might better co-operate and hold the prices up before such disaster happens to many of the producers."

OLIVES AND NUTS.

An official statement has been made that the total olive crop in Spain was 1,302,500 tons, or about 200,000 tons less than 1913.

J. B. Neff of Anaheim was a caller this week. He reported the blight as being very bad in the walnut groves; but in spite of that, the crop would be much larger than last year.

Fifty-five thousand olive trees is the estimated planting done in Butte county this year, according to County Horticultural Commissioner, Earle Mills.

The organization of a state-wide Olive Association has been completed and now a far-reaching campaign for membership will be launched. Officers are: President, John J. Avis of San Francisco; Directors, A. B. Miller of Fontana, W. P. Hammon of Oroville and F. B. McKevitt of Sacramento; Director of Exploitation, Geo. C. Mansfield of Oroville; and Secretary, E. L. Underhill of San Francisco.

MISCELLANEOUS.

On June 6 the earnings of tolls for the use of the Panama Canal passed the $4,000,000 mark.

A farm bureau with thirty members was recently established in the Buena Vista district of Nevada county.

Placer county will have a farm adviser within a very short time, the necessary appropriation having been voted by the Supervisors.

A shipment of about 3000 cases of canned fruits and vegetables was made last week by the Central Califoria Canneries Company of Sacramento to London.

Sacramento will shortly be visited by Roy M. Hagen, agent of the U. S. Dept. Agr., who is here in the interest of the movement to establish boys' agricultural clubs in the schools.

Twenty-eight hundred dollars has already been subscribed by the citizens of Redding for the Northern California Exposition to be held in September. Lassen and Modoc counties may join.

Governor Johnson recently signed a bill which appropriates $4000 for the construction of buildings on the lands of the agricultural experiment

ATTENTION! ALMOND GROWERS

Trainload shipment of No. 2 Read "Sure Pop" almond hullers leaving plant of Schmeiser Mfg. Co., Davis, Cal.

Reports show excellent prospects for a better than normal crop of almonds this year and we are already feeling the effects of this news on our sales of

READ "SURE POP" ALMOND HULLERS

which we manufacture. At the last minute there will be a rush as usual and every one will want immediate shipment.

ARE YOU GOING TO BUY A NEW HULLER?

There is so much money tied up in complete machines that we will not finish them except on order, but we are in a position to assemble on reasonably short notice. WRITE AT ONCE for our terms and your letter will be given prompt attention. Our suggestion is that your order be placed early so that you may be sure of delivery on the date you need the machine.

PRICE LIST AND CAPACITY.

No. 1—2-3 tons capacity, $1250.00 f. o. b. Davis.
No. 2—1½-2 tons capacity, $750.00 f. o. b. Davis.
(Special picking arrangement in tailing spout, $50.00 extra.)
No. 3—¾-1½ tons capacity $100.00 f. o. b. Davis.
(Note: No. 3 is a hand machine but can be operated by motive power. It has no separating attachment, consequently the sorting must be done by hand.)

SEND FOR PARTICULARS AND ANY OTHER INFORMATION.

SCHMEISER MANUFACTURING CO., Davis, Cal.

station of the University of California in Imperial county.

The University of California has appointed C. J. Williams to assist Farm Adviser Lyons of San Joaquin county. Attention to the boys' clubs, three of which are organized in that county, will be the particular work of the assistant.

Three boys' agricultural clubs are now flourishing in San Joaquin county; one at Lodi is raising potatoes, using the best methods, one at Stockton is doing likewise; and experiments in popcorn raising are being made by the Ripon club. The University of California will pay all the expense for a trip East shortly before Christmas for the boy in each club getting the best results.

John Westall of Riverside has been appointed Sales Manager of the newly organized Turlock Merchants' and Growers' Corporation. He is president of the Interstate Fruit Company of Riverside, handling citrus fruits. The fact that the navel season is now over makes it possible for him to take up his new duties of handling the cantaloupe sales for the Turlock growers.

GRAIN AND FIELD CROPS.

Merced is reported to be sending out 25 carloads of tomatoes weekly.

The grain and hay crops of the Salinas valley are larger this season than any previous year.

That the Yuba county rice crop will have a gross valuation of $240,000 is the estimate made by County Horticultural Commissioner G. W. Harney.

The first watermelons left the Alta district of Tulare county on July 9. The acreage is under the average, but with prices good, growers expect a good season.

The acreage planted to sugar beets around Salinas this season is very large, and a record-breaking tonnage is expected. Harvesting, will commence two weeks earlier than usual.

Grain crops are almost all harvested and reported generally as being nearly full crops. In Kern the wheat was light on account of rust, and some other counties report short crops on account of short acreage. Much grain has been cut for hay.

Wire worms have damaged beans greatly in districts around Davis, Oxnard, and elsewhere. An extra acreage of beans has been planted in Yuba and Sutter counties, but in Colusa the slow receding of the floods has prevented as much as usual. Humboldt has a small acreage doing well as inter-crop with the walnuts.

Cantaloupe shipments from Brawley are being made under the supervision of a representative of the Office of Markets of the U. S. Dept. Agr. in co-operation with the distributors of the Imperial Valley. Systematic distribution is being made by the Government representative and his 40 assistants who keep in direct touch with all markets by means of daily telegraphic reports, thus preventing the shipment of melons to markets already sufficiently supplied.

EXPOSITION EPITOMES.

How the Panama Canal will help our trade with Central and South America and Europe will be discussed at the Convention of the American Economic Association to be held at the Exposition August 11-13.

The 69th annual convention of the Delta Kappa Epsilon Fraternity will be held in San Francisco July 12 to 20. Admiral Robert E. Peary will tell why he planted the D. K. E. flag at the North Pole.

The Pan-American Road Congress will be held in San Francisco and Oakland September 13-17.

On August 11 the Woodmen of the World will celebrate their day at the Panama-Pacific Exposition.

The Ninth International Purity Congress will be held at San Francisco July 18 to 24, the white slave traffic and public vice being the main topics to be discussed.

The wonderfully artistic Exposition, with its many magnificent buildings and palaces, and its extensive gardens and lawns, has never been more beautiful than now. The advancement of summer has given added brilliance to the great flower beds; new flags and banners stream gaily in the wind, and the weather is ideal for the full enjoyment of this greatest achievement of man's genius.

It is estimated that nearly 200,000 people attended the Fair on July 5. This is the greatest attendance since Opening Day, Feb. 20. The Fair is half past, and over 8,000,000 have passed through the gates. Average daily attendance since opening has been 56,240.

Colonel Roosevelt will be at the Exposition on July 21, which will be "Roosevelt Day."

VITICULTURAL CONGRESS.

The International Congress of Viticulture met at the World's Fair Grounds this week, having a small attendance, largely of wine makers, to whom the program was especially addressed.

Among the subjects other than wine-making were those of insects and diseases of vines. Following are some of the points brought out:

Lime sulphur used in vineyards must be used alone on account of injurious chemical combination, which does not occur when paste sulphur or other forms are mixed with other spray materials.

The quarantine in California against grape cuttings on account of phylloxera is unnecessary because only the root forms propagate themselves, and the spread has been very gradual. The pest has been working in the State for twenty years.

Grape-leaf hoppers thrive where dry winter quarters are provided in the shape of leaves, dried grass, and weeds. They live on many other common plants besides grapes, when grape leaves have fallen or have not yet appeared in the spring.

A mixture of atomic sulphur with nicotine sulphate, using some whale-oil soap as a spreader and a 45 degree nozzle with a spray-tank pressure of at least 200 pounds, controls leaf-hoppers in Fresno county when applied once early in the season before much damage has been done, but before many hoppers have passed the fourth molt. The atomic sulphur sticks to the leaves and destroys the hoppers which hatch within ten days after application, but is primarily used to prevent mildew because it sticks much better than any other forms, especially when a little glue and whale-oil soap are used in the spray.

"Dubbins is a singularly unfortunate man." "What makes you think so?" "He's the sort of person who is always caught with his mouth open when a photographer takes a group picture."—Birmingham Age-Herald.

New York Belting & Packing Co.,
San Francisco, Calif.

Gentlemen:- "Attention Mr. Gregory"

Your last shipment of Teet Special belting came duly to hand. Please accept our thanks for promptness in filling this order.

We are now using thie brand of belting on a good part of our plant and have found it so satisfactory that we are replacing all worn out belts with "Teet Special" We have placed thie belt on high speed machines and in places where severe strains and overloads are carried and our experience is that it carries the loads and lasts longer than the best grades of leather or Balata belting.

We find that it is not affected by heat or moisture, will not tear out at the lacing and will last twice as long on a run that wears out the best grade of leather belt. We do not hesitate to recommend "Teet Special" belting for use for any purpose for which a belt is used.

Very truly yours,
Petaluma Box Co.

White Hogs on a Fruit Ranch.

[Written for Pacific Rural Press.]

When C. B. Cunningham of Sacramento county decided to raise hogs in connection with fruit on his 50-acre ranch near Mills, Sacramento county, six years ago, he selected the O. I. C. breed as his best bet. Since then, through persistent effort, he has come to be recognized as the leading grower of that breed in the State and is often called the "father of the O. I. C.'s in California."

Considering that Mr. Cunningham has not only grown fruit extensively in those six years, but has also been associated with the selling end as well, his success as a hog breeder is out of the ordinary, and his methods could be profitably used by many fruit raisers who have more time for details.

His herd as seen today comprises 15 aged sows and three herd boars, Iowa Boy, Woodview Earl, and Missouri Lad, all of which have been carefully selected, the sows for their size, prolificacy, and motherly qualities; and the boars for heaviness of bone, size, and finish. It is the intention to increase the herd to 25 sows and three boars in the immediate future.

Not only was Mr. Cunningham the first breeder in the State to immunize his entire herd against cholera with the serum-virus treatment, but he has been a firm believer in sanitary quarters. The yards and runs were built on the brow of a low hill, the houses being six feet high and nine feet wide. These houses are movable and are used for farrowing purposes. The yards in which they are placed are 18 feet wide and 80 feet long, each equipped with concrete wallows supplied with clean water containing disinfectant to prevent lice and vermin on the hogs. Concrete flooring and iron troughs for feeding and watering are also used for sanitary reasons.

Sanitary Hog Quarters on the Cunningham Ranch in Sacramento County.

The entire ranch is fenced with hog-tight fence and during the winter months the hogs have the entire run of the place. At other times of the year, alfalfa, both green and dry, is fed liberally, together with beet pulp, ground grain, ripe fruit, and vegetables. Sugar beets, turnips, carrots, corn, summer squash, and pumpkins are raised for the hogs also.

Soft coal, lime, sulphur, wood ashes, and salt are kept before the hogs; and air-slacked lime is used freely in the bedding and runs to keep down foul odors.

Exhibitions Help Build Trade.—Being located close to Sacramento, and realizing the importance of showing, Mr. Cunningham began exhibiting three years ago; and through his efforts along this line has been able to familiarize many State Fair visitors with the white hog, as well as to supply them with foundation herds.

Due to prejudice, which Mr. Cunningham considers unfounded, it required a good deal of missionary work to advance the breed as it should be, and in this respect a statement of Mr. Cunningham's is of interest. He said, "Some breeders of dark-colored hogs claim that the white hog will not stand the heat. This is absolutely not true. For the past six years, I have been raising this breed here in Sacramento county and have yet to see a single individual that will not stand the heat as well as the other breeds. The O. I. C. of today is no more like he was twenty years ago than the other breeds are like their predecessors of that time."

Mr. Cunningham's experience with hogs clearly demonstrates that hog raising on a fruit ranch is entirely practicable, especially when alfalfa can be grown.

As a result of the work done in Oregon and Washington by the Portland Union Stock Yards in advancing the swine industry of these two states, California packing concerns are now able to purchase hogs from these states instead of from the Middle West as in previous years. It has only been four or five years since Oregon was importing hogs from the Middle West, and the present condition is more noticeable on that account.

SWEET WATER TRAPS WASPS.

To the Editor: As the wasps were destroying the ripening fruit, I suggested to my brother that he get some fruit jars, and fill them half full of molasses and water, to trap the wasps. He trapped not only the wasps, but also innumerable moths, millers, colored (but no white) butterflies, and the so-called blue-bottle flies. He hung one jar in every fourth tree and they were generally pretty well filled in three days and had to be emptied and refilled with the sweetened water.

Beginning With Sheep.

With the increasing interest that is being manifested by smaller farmers in the sheep raising business, it would seem that advice to the beginner in the selection of breeding stock is timely. H. S. Arkell, of the Department of Agriculture of Canada, says:

"It is strict attention to the little things in sheep raising that so generally leads to a great success. No one should enter extensively into the business without having had a thorough practical experience. It is best for him to commence in a smaller fashion. As his flock increases in size so will his experience and he will learn for himself the proper methods to apply to every condition that may arise.

"Too many beginners become prey to the salesman who sees no need of correcting mistakes that the beginner may make in the purchase of his breeding stock. Generally the novice wishes to make personal selection of the animals and, if his ideals respecting type are somewhat astray, he gets many sheep which he would be better without. Had he been sensibly disposed and confessed his ignorance of many points of breed type, the salesman, unless he were most unscrupulous, would have aided him in choosing animals that would prove valuable to him. Few breeders who have any sort of reputation at all to sustain will take a rank advantage of a man who ingenuously leaves the selection of his purchase with them. In fact, many breeders state that they much prefer a buyer to make a personal choice than sell by description through the mail, since in the latter case they feel compelled, in order to uphold their reputation, to send a better animal than the price really calls for. With personal selection the seller's liability is limited, since he does not feel himself responsible for what the purchaser does.

Selection of Breed or Type.—The selection of breed depends largely upon the individual taste of the shepherd and the object he has in view in raising them. Success can be attained with any of the popular breeds produced here, but no person should ever commence raising a breed for which he knows he cannot obtain a ready sale. Perhaps his means and conditions do not warrant him to enter into the production of purebreds. If he is breeding sheep merely for mutton purposes, high-class grades will suffice, yet even in buying grades he should take care to select only those possessing a good mutton conformation. Many farmers think that, since they own simply grades, 'any old sheep' at all will produce good enough results in the flock, and, therefore, the more cheaply they can buy the better. This is false economy, for very frequently they obtain in their flock animals that do not pay for the expense of their keep.

Uniformity of Type. — Unity of type in the flock should be the direct aim of every breeder. This applies to grades as well as purebreds. With purebreds this feature is especially important. In a flock of sheep where several types obtain, choice of a suitable ram is most difficult. Disparity in this respect detracts from the general appearance of the flock and gives the buyer or casual observer an unfavorable opinion. Every breeder should aspire to produce a distinctive type. He should endeavor to breed a class of sheep possessing characteristics that wherever the animals are, they will be recognized as his breeding. But to attain this he should never uphold some fancy character in preference to utility features. No features should be given undue prominence beyond another, especially one that is purely ornamental. The establishment of an ultra form of some fashionable character has at times become an obsession with many breeders; and this sin (for it cannot be called anything else) must be avoided. The ultimate destination of most purebred rams is at the head of grade flocks, and their utility features only should be taken into consideration.

The beginner should study well and become familiar with the type or breed he has selected. He must be able to recognize undesirable features and disqualifications. These he should endeavor to preclude from his flock, and to this end he should practice a rigorous culling every year. Individuals which do not possess the merits that his ideal calls for should be banished from the flock. Sheep having grave defects of character or type should not be used for breeding purposes.

CALIFORNIA'S PERCHERON STANDING.

California stands 17th in the United States in Percheron breeding, according to Wayne Dinsmore, Sect'y of the Percheron Society of America. During the fiscal year ending October 31, 1914, California breeders recorded 77 American bred colts in the Percheron Society of America. This number was recorded by 24 members who registered 76 head and by one non-member who recorded one animal.

The majority of the animals registered during the time specified were colts foaled in 1913, although the figures include some produced in 1912 and some in 1914.

Inasmuch as names, addresses, and number of animals recorded are matters of extreme interest to all horsemen located within the State and in adjoining states, specific details are given.

Wm. Bond, Alameda county, recorded three animals; Friesleben Est., Butte county, recorded 1; J. J. Shrock, Fresno Co., 1; Cal. Mexico Land & Cattle Co., Imperial county, 1; Oral C. Thompson, Lake county, 6; Wm. Brockman & Son, Lassen county, 1; Elliott-Brant Rancho, Los Angeles county, 1; August Freese, Los Angeles county, 1; Ed. R. Maier, Los Angeles county, 2; J. C. Johnson, Mendocino county, 1; J. L. McCracken, Mendocino county, 3 and 1 imported; J. L. Harvey, Modoc county, 3; T. M. Harvey Modoc county, 2; F. L. Hall, Riverside county, 1; A. J. Stalder, Riverside county, 9; Revel Lindsay English, San Bernardino county, 4 and 4 imported; Whitehall Est. Co., San Francisco county, 4; Francis I. Hodgkins, San Joaquin county, 1; H. G. Learned, San Joaquin county, 3; Edmund Miller, San Joaquin county, 1; C. A. Peninger, San Joaquin county, 7; Cal. Polytechnic School, San Luis Obispo county, 6; Oliver Jenkins, Santa Clara county, 6; Geo. J. Read, Ventura county, 7; and H. P. Eakle, Jr., Yolo county, 2.

HOT WEATHER

the season a

DE LAVAL SEPARATOR

saves most over any other separator or skimming system

IT'S A GREAT MISTAKE FOR any dairy farmer without a separator or using an inferior machine to put off the purchase of a De Laval Cream Separator in the summer months

GREAT AS ARE THE ADvantages of the De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the midsummer season than at any other time.

THIS IS BECAUSE HOT weather conditions occasion greatest butter-fat losses with gravity setting and render it most difficult to maintain quality of product with any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

THEN THERE IS THE GREAT saving in time and labor with the simple, easy running, easily cleaned, large capacity De Laval machines over all other methods or separators, which naturally counts for most at this time of the year.

HENCE THE GREAT MISTAKE of putting off the purchase of a De Laval Cream Spearator in summer, whether you already have a poor machine or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itself by next spring but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

EVERY CLAIM THUS MADE IS subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you, in your own dairy, without cost or obligation on your part.

IF YOU DON'T KNOW THE nearest De Laval agent please simply write the nearest main office as below.

With the Live Stock Men.

DAIRYING.

An 80-acre dairy ranch has recently been purchased in Biola, Fresno county, by C. L. Paine of Fowler.

The San Joaquin Cow Testing Association now has 1100 cows. This association was organized about three months ago, at which time it had only 600 cows.

Seventeen carloads of butter were shipped in 15 days in June from Salt Lake City to Chicago markets, indicating the growth of the dairy industry in that section.

Shipments of Formaggio pecorino di stagione (sheep milk cheese after curing) were made from Rome to the United States during 1914 to the value of $1,297,893.

Two carloads of Holstein cattle were recently received by the Churchill Creamery of Fallon, Nev., from Idaho. These were purchased by the Creamery for the farmers of that section and will be distributed among them.

That Winton, Merced county, is making rapid progress as a dairy section is shown by the amount of butterfat being shipped from there. There were 5480 pounds shipped in April; 6281 in May; and 3241 for the first half of June.

A complaint has been recently filed by the Montague Creamery of Siskiyou county with the railroad commission, urging that the express companies reduce the charge on shipments of butter from Montague to San Francisco.

As an incentive to greater efficiency in dairying, the Development Committee of Butte county have decided to award a loving cup to the owner of the cow in the Gridley Cow Testing Association, producing the largest quantity of butter fat.

A pamphlet, neatly bound, of convenient size, and well illustrated, has just been issued by the American Guernsey Cattle Club, containing a fund of general information in regard to what the Guernsey breed has accomplished and is doing at the present time.

Many Brown Swiss dairy cows are being brought into the Toro district of Monterey county from eastern states and will be placed on the mountain dairies, for which purpose this breed of dairy cow is particularly adapted. Although popular in New York state, the Brown Swiss cows are not found to any extent in California.

The farmers of Carson Valley, Nevada, are making great headway in improving their herds. As a result of the testing being done there, large numbers of useless animals or those not coming up to the standard, are being sold to stock buyers and replaced by a better grade of cows. A number of tests are being carried on by students of the agricultural department of the University.

After the war is over, it is proposed that the United States shall turn the tables on Europe and ship dairy cattle to the dairy centers there. For this purpose, the National Dairy Council has announced that they will open headquarters at Chicago, which is to become the center of the exporting trade. A campaign is about to be started by that organization for the prevention of cattle plagues and for co-operation with state legislatures to obtain perfect dairy sanitation everywhere.

MISCELLANEOUS.

A distributing plant to handle two cars a week of meat will shortly be established in Sacramento by Miller & Lux.

Among the bills recently approved by Governor Johnson is one which will appropriate $2500 for the purchase of livestock for the State Prison at San Quentin.

An effort is being made by the Dairymen's Association and the Humboldt County Farm Bureau to secure the appointment of a county veterinarian for Humboldt.

The $3,000,000 packing plant of Armour & Co. in Argentine has just been completed. It is expected that most of the meat shipments will go to Europe, mostly to England.

A small herd of blooded cattle, consisting of a bull and three cows, were recently purchased in Sacramento county by a committee of members of the Board of Supervisors of Nevada county and the superintendent of the county farm. These will be placed on the county farm with the intention of making it a model for private farmers.

Nearly one hundred dollars for one day's sport isn't so bad, especially when the fun proved a boon to many stockmen. Last week two hunters trailed and killed an enormous mountain lion which has been devouring an average of two to ten calves a month for years in Kern county. Rewards to the amount of $75 were paid to the hunters and it is expected that the skin will bring them about $20.

Receipts at the Portland Union Stock Yards for the week ending July 3 were: Cattle, 1707; hogs, 6313; and Sheep, 3404. On account of the holidays, the receipts in all lines were small. Steers of high quality sold at $6.75; cows and heifers in proportion. Top hogs went for $7.60. Sheep receipts appear to be on an unsteady footing. Lambs, unless they show quality, have a downward tendency.

HORSES AND SWINE.

The National Duroc-Jersey Swine Record Association will shortly make Peoria, Ill., their headquarters.

A carload of horses recently left Fallon, Nev., for the East, whence it is presumed they will be shipped for use by the French army.

On July 7 two carloads of horses left Riverdale for New York, from which point they will be shipped to France.

Six Duroc-Jersey hogs were recently shipped to I. G. Lacey of Grant Falls, Colo., by the firm of Ross & Weisbaum of Kings county.

A trainload of 200 horses gathered from various points in the San Joaquin valley recently left Tulare for Fort Worth, Tex., for use by the French army.

A representative of the British government will make Sacramento his headquarters while engaged in securing all the available mules in the State for pack train purposes by his government.

Twenty-five thousand horses are reported to have been purchased in

LIVESTOCK DIRECTORY.

FOR SALE—Young calves from good mixed dairy cows. P. O. Box 213, Antioch, Cal

the United States by Italy during the past few months, and it is said that there are agents in the country looking for as many more.

In Shasta county, it is reported that two agents of the French government are seeking acceptable horses for war purposes. They desire animals over 5 years of age, weighing 900 to 1300 pounds.

Bryce Sherman scored 85.8 points and was declared the winner in the pig-feeding contest conducted by the agricultural department of the Tulare High School, under the direction of the University of California.

A swine breeders' association is under consideration for Chowchilla.

Four carloads of horses were shipped out of Stockton last week, having been secured in San Joaquin and Calaveras counties. It is said that four agents of the British government are scouring that part of the State for horses and mules for army purposes.

CATTLE AND SHEEP.

Great Britain has placed an embargo on the exportation of all wool, except Merino, to the United States or to the Allies.

The Chicago steer market is advancing rapidly, and it is expected that choice animals will shortly bring $10 there.

The sale of about 100,000 bales of Merino and a like amount of crossbred wool is reported to have been made to London recently.

A 21-pound fleece from one Cotswold sheep has been sent to the Panama-Pacific Exposition by Armand Perkins of Baker City, Ore.

An agreement has been made between the English Board of Trade and members of the Textile Alliance, Inc., that the United States may soon export to England a large quantity of tops and yarns.

Several of the Basque sheep men of Monterey county are adding beef stock to their farming. Recently several cars of purebred Shorthorn and Hereford cattle from other parts of the State were received by them.

Heavy shipments of cattle are being made weekly by stockmen in the southern part of Monterey county, among the shippers being John and Sam Matthews of Kings City; Redmond and Cahill, Parkfield; and John Conley of San Lucas.

An organization is proposed for Monterey county which will protect cattlemen against estrays and rustling. It is expected that the association will publish a book containing facsimiles of cattle owners' brands and earmarks.

The fancy prices offered for beef in the British Isles is said to be causing the farmers to dispose of their blooded breeding cattle, thus robbing the country of its fine stock. The Board of Agriculture has issued circulars condemning the practice.

A bill has recently been passed by the French chamber of deputies authorizing the purchase of 100,000 cattle on the hoof. This is in addition to the 30,000 head already secured in this country and the 240,000 tons of refrigerator meat contracted for.

A large amount of American-made serge has been sold to London for use by the civilian population. It would seem then that the English mills are so occupied at the present time with war equipment, that a new field may be opened for American manufacturers.

The sale of 2094 acres in Alexander Valley, Sonoma county, is reported to have been made by Joe Alexander to H. C. Lawrence of Fullerton. The property is considered one of the best stock ranges in the State, and it is the intention of the new owner to raise blooded stock.

Hereafter beef consumed in the Panama Canal Zone will be secured from cattle slaughtered there instead of dressed beef from this country. The killing of local cattle to test its quality has already begun; and agents will shortly be sent to Central and South America to secure animals which will be sent to the Canal Zone to be fattened and then sent to the block. The Canal supply department figures a saving of 10 to 20 per cent can be made in this way.

A DAIRYMEN'S ASSOCIATION WORTH WHILE.

[Written for Pacific Rural Press.]

On the assumption that when farmers want a thing they go after it as a whole rather than as a unit, the dairymen of Humboldt county have been the only farmers of that class in the State to organize and maintain a dairymen's association for any considerable length of time.

Most associations are started for the accomplishment of some specific thing and so it was with the Humboldt County Dairymen's Association. When started several years ago it was the intention of the organizers to advance community breeding, the members deeming such a work entirely practicable in view of the large number of Jersey cattle which are in the county, and considering such steps the surest and quickest way of getting and keeping good bulls in the county.

Almost immediately after organizing, however, the work of the association was switched from the original purpose to things returning a quick direct profit, the buying of seeds being one.

At the start opopsition to this plan was strong among the local merchants, who naturally objected to losing the seed trade of the county; but the saving to the farmer as well as the increased quality of their seed was so apparent that this line of work on the part of the association has continued and at present the annual business done by the Association in seeds amounts to between $3,000 and $4,000. Being the wholesale rather than the retail price as before, this does not represent the total cash business that would ordinarily be credited to the seed business of the members, but it does represent a big saving each year to the farmers.

Soon after its organization, legislation matters pertaining to the dairy industry came up; and since then a legislative committee of the association has kept in close touch with the proposed laws, both State and local, with the result that politicians have learned to consult the association before passing any dairy legislation.

Ass'n Stops Turnip Feeding.—Some years ago the butter from Humboldt county became poor on account of excessive feeding of turnips, which would not allow of the creameries turning out a good product.

Seeing that a poor reputation for their chief product meant an actual loss to them through cheaper butterfat quotations, the Association, through co-operation with the local creameries, put a ban on turnip feeding, the creameries refusing to accept milk or cream from those dairies where turnips were fed, and the Association giving their moral support of the movement. As a result of their stand the creameries have been enabled to enforce this rule with the result that their butter is again up to a high standard, and commands top prices, which in turn allow the dairymen to command top prices for their milk and cream.

The Association's approval has such strength that as a rule all matters affecting, or apt to affect, the dairy industry are taken up at its monthly meeting, and every side of the issue thoroughly discussed before action is started.

While they have strayed a long ways from their original purpose of community breeding, there is still much talk among the dairymen on this subject and several members expressed their belief that some time in the future the work in that direction would be pushed. In the meantime they are doing an immense amount of good for the dairy industry, and setting an example which should be more frequently followed by other dairy sections of the State.

Pocket handkerchiefs and laces will whiten if soaked over night in a bath of toilet carbolic soap.

Veterinary Queries and Replies.

[Answered by Dr. H. R. Wintringham, Petaluma, Cal.]

WHITISH SPREADING ERUPTION.

To the Editor: There is some kind of a breaking out on my cows. It starts about the size of a bean and then grows larger, the hair comes off; it is a rough whitish looking color, coming principally around the head and ears.—A Subscriber, Corning.

[This is ringworm. Wash affected parts well with warm soap and water, then apply tincture iodine daily for one week, after which apply vaseline to the part once or twice to keep the skin soft.]

LUNG WORMS IN CALVES.

To the Editor: Please give me a remedy for lung-worms in calves. Last year I lost a number, and I have some now that have commenced to cough. Have been particular about keeping things clean and do not know what causes it.—J. W. D., Rhonerville.

[There is no absolutely certain remedy for this trouble. Two of the best treatments are as follows: Get a hypodermic syringe which will hold two drachms. Force the needle into the interior of the trachea or wind pipe, and inject two drachms of the following: ether, 2 oz.; oil of turpentine, 1 drachm; or use benzine in 2 drachm doses. Continue this treatment daily until symptoms are relieved.]

RIDDING BITCH OF PUPS.

To the Editor: We have a very fine female bull terrier; accidentally she got with pup with astray about two weeks ago. Please tell us how to get rid of them; what we can give her that will cause her to lose them, as we don't want her to lose her shape.—F. V. A., Modesto.

[The only certain way to rid your bitch of her pups is to have a competent veterinarian operate and remove them, including the uterus and ovaries. No medicinal treatment is certain. However, you may give her two grains of potassium permanganate daily for four days and try to abort them in this way.]

WHAT THINKING IS DOING FOR BEEF.

(Continued from page 49.)

bred yearlings. This was a disadvantage for two reasons: the poorly bred steer does not put on flesh as economically as the well bred one, and the butcher demand is not usually for a heavy finished animal, but rather for the small one in the spring when finishing is completed. Thus the gain in weight was not so large as it should be and the spread in price between the fall, when feeding was started, and the spring when finished, was not so great as it should have been. As we have seen by the above statement of the range man, this condition will not exist when the range man finally settles down into his new method.

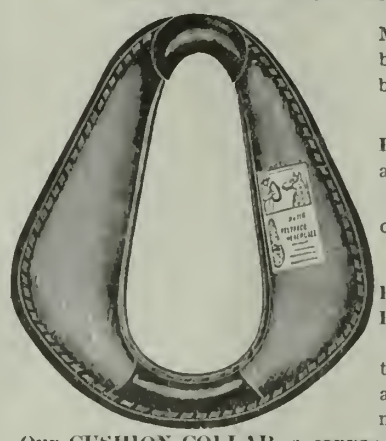
Finances.—So far in the new scheme of things, so good. We have shown that the range man and the feeder are beginning to see the light through the same deep hole, and were their lands adjacent to each other the trip from range to feed lots, and then to market would be fine sailing. Such is not generally the case, so two other factors must be theorized on before the chain is completed. First, a means of exchange which will allow the breeder and the feeder to locate each other for barter and trade in the fall; and, second, a system of financing which will permit the banker or money lender to make loans on cattle as he would on other property.

Few farmers who are prospective feeders have the capital to purchase cattle outright from the range man, in such quantities as they would require. The range man, on the other hand, wants and quite often needs his money for the cattle as soon as he sells them. The situation is met in the East by loan companies; and it is suggested that such an organization is necessary here to handle the loans before the breeder and feeder can co-operate.

Another theory is that the local merchant who deals with the prospective feeder sign a note with him, upon which the local banker could loan the required amount. This has been found satisfactory in Texas with dairy cattle.

Buying and Selling.—With unlimited capital, however, and granting for the sake of argument that both range owner and farmer are agreed on the new order, a system of distribution between breeder and feeder and again between feeder and packer is still lacking.

Suppose, for example, a range man has a thousand steers to sell. Before he leaves home, he wants to be sure of his customers. Unlike his present system, he cannot sell them in a lump, but must scatter them out in small parcels. Finding the feeder, therefore, means an added selling expense; and for that reason he figures, and justly so, that he can sell to better advantage direct, even though his cattle are still unfinished for the market.



Turning the tables round to the small feeder seeking stock, we find he also is at a disadvantage in buying. He is unable to locate the kind of stock he is looking for in the right quantities for his purposes. He can perhaps find, after much time and expense in travel, the desired quality, but in too large a quantity and vice versa.

Considering that the object of fattening cattle is to sell the feed at a fair market price, and also to conserve fertility, it is evident that the farmer cannot well afford to go to the above-mentioned expense of buying. Perhaps the cattle loan company could also aid in this respect.

On top of this, however, is the problem of marketing in small lots. Were the cattle finishing system above outlined generally practiced, the packer could afford to send his buyers into a field, but when such feeders are badly scattered, the additional cost to the packer excludes him from the plan and throws the feeder onto the mercy of either the local commission merchant or the local butcher, whose demand is limited.

Getting our theories and facts all into one hat, then, we find that while it appears entirely feasible to suppose that our beef raising scheme will ultimately be much different from our present wasteful one, it is going to take time to couple up the links in a satisfactory manner to all concerned. In the meantime, thinking will continue and with it some progress.

BEWARE OF CHEAP, EASTERN MADE HORSE COLLARS

More shoulders are being ruined by poorly-constructed collars than by the work the animals are doing.

W. DAVIS & SONS' FELTFACE COLLARS are guaranteed to prevent sore shoulders.

Look for the felt at the edge of the stitching.

Made to sell as follows:

FELTFACE, medium draft, $5.00
FELTFACE, heavy draft... 6.00

If your dealer does not have them, we will tell you where they are to be had, or send direct if no dealer is within reach.

Our CUSHION COLLAR, a canvas and leather Boston Team Collar, is now to be had for $3.00.

Corn for Napa County Hogs.

[Written for Pacific Rural Press.]

Napa county farmers are fast being converted into purebred livestock breeders, as is evidenced by the number of purebred herds which have been founded there in the past two or three years.

Hogs seem to predominate numerically, due perhaps to the convenience with which they may be fitted into a diversified scheme of farming.

One of the late additions to the purebred hog population there is the herd of registered Duroc-Jerseys owned by Scott S. Southworth.

Four sows and a boar were purchased by Mr. Southworth in the East about a year ago, and, as is customary with swine, this number has been greatly increased since then.

After considerable study of the feeding problem, a combination of corn, tankage, and alfalfa pasture has been decided upon, with the addition of middlings for the brood sows and young pigs.

Corn is preferred to barley; and as it is practicable to raise good corn in Napa county, Mr. Southworth expects to continue to raise and feed that grain. The corn possibilities there are an asset to the hog grower, which is rather uncommon in California.

CORN WORM AND GREEN LADYBUG.

To the Editor: I would like to know what to do for grub that crawls in through silk of corn and bores a path on outside of cob. Also would like to find a spray that will kill off "green ladybugs" from string beans.—A. K. T., Sacramento.

[Though much effort has been put forth to save the corn from the "earworm," no satisfactory prescription has yet been announced. If the corn is silking when the moths are flying the ears will be more or less affected. Corn planted very early or late, which does not come into condition while the moth is active is likely to have little trouble. Green ladybugs (diabroticas) can be poisoned by spraying with lead arsenate, but we would not dare to use it on a vegetable of which the outside is eaten, as is the case with string beans, for fear of poisoning the eater. There is no good treatment for diabroticas. Fortunately they are not usually abundant every year. —Editors.]

SMALL BLACK-SPOTTED BEETLES IN GARDENS.

We have been deluged with the beetles described above, and we have answered innumerable queries on the subject. They are the Diabrotica soror, 12-spotted cucumber beetle. Probably the best way to control them is by spraying 8 pounds neutral arsenate of lead per 100 gallons of water thoroughly on the upper and under surfaces of the plants affected. Apply this whenever the bugs become numerous. If the plants seem to be dying without cause, and the beetles are numerous, their larvae are probably eating the roots, and may be killed as recommended below by Wm. Moore of the Minnesota Experiment Station. Mix 1 teaspoonful of "blackleaf 40" in a gallon of water. When larvae are suspected, pour some of this onto all sides of the stalk of the plant so it will run down and touch the larvae which are not far below the surface.

GROWING TIMOTHY.

To the Editor: What is the best way to sow Timothy for hay in Sierra Valley? Does it need irrigation, and how much? We have frosts here most every night. Also what is best time to plant dry crop alfalfa.—J. B.,

[Timothy is only grown in mountain valleys in the extreme north of the state, where it does exceedingly well. A correspondent of the Rural Press who recently went through that part of the State writes us that nearly every one in Sierraville that grows timothy plants it in the fall. And after the snow melts off in the spring they have an early start on timothy. It grows there from 3 to 4 feet high and does well. About 150 lbs. of seed are usually sown to the acre.

We cannot advise you about growing alfalfa where you have frost nearly every night. The common alfalfa would probably do little or nothing under such conditions and only the kinds which the seedsmen offer as extra hardy would promise much. Sowing should be done early in the season, when the ground gets warm after the snow melting.—Editor.]

POISON GOPHERS AND RATS.

To the Editor: Gophers are unusually numerous and wary this season. They spring or bury the traps without being caught, and refuse all ordinary poisoned baits, such as Gophergo, etc. I got a few by taking a small beet, slicing off a piece of the root and inserting a little strychnine in the root, which I pushed down their burrows as far as I could. But they got too cunning at last to touch beets. I therefore thought I would try a new bait. I picked some green unripe Windsor (horse) beans, punched a small hole in each, inserted a little strychnine, put a bean in an iron spoon, and poured a little sirup over it. I then cleaned out the runways so that I could push the spoons in the full length, and closed the holes up with a lump of earth. This gets them 9 times out of 10, as they can't resist the sirup. They are as cunning as rats, but even rats can be caught or driven away if you know their weak point, and that is eggs. They will take an egg every time, no matter how much you may handle it, and by punching a small hole in the egg and putting in a little strychnine I have cleared them out, and have not seen a rat for nearly 3 years, although my neighbors have lots of them. If every one in town and country would give them poisoned eggs the rats would soon be exterminated. Sam'l Haigh.
San Jose.

BLUE-JAYS EAT COCOONS

To the Editor: As I was cultivating in my prune orchard, I noticed a good many jay birds hopping from limb to limb, looking for the cocoons of the caterpillar, which they eat. They pick them off, stand on them, pull them to pieces with their bills, and devour the contents. I advocate saving the jay birds; they are one of the best friends of the ranchers. Would they not get rid of the tussock moth? Wm. Strelow.

H. SEVERENCE, poultry superintendent of Stag's Leap Ranch, Napa county, recently visited this office while on a trip he was making for the purpose of selecting some breeding stock for use in fall hatching of chicks. Mr. Severence has had years of experience in this line, at times hatching two thousand or more chicks during August, September, or October. He has promised that he will soon write us an article describing some of his experiences with fall chicks, in which he will endeavor to give beginners some instructions that should be helpful.

Hatch Chicks This Fall.

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n. of California.]

Since we have been running the series of articles on fall hatching of chicks, we have, until the past week received only letters of endorsement from experienced poultry keepers who have made it profitable to hatch fall chicks, or from interested enquirers seeking advice; but now we have two carrying more or less of the opposite flavor. Only one, however, from Mrs. Swaysgood, contains anything of an educational nature, the other is practically a simple display of contrariness without any advice or suggestion, which renders it unworthy of attention. We mention this because we urgently wish to hear from those who do not favor fall hatching or who may have been unsuccessful. There are, no doubt, locations where it may be unwise to undertake fall hatching. By discussing both sides of the question, all may be benefited; even those who have failed in the past.

Susan Swaysgood states: "Mr. Hull, of Mill Valley, asks Mr. Croley why breeders do not advertise fall chicks for sale. I think perhaps I can answer that question as well, if not better, than Mr. Croley, so I am 'butting in.' In the first place, eggs are usually higher in August, September, and October; then again, most hens are usually molting at that time, which interferes with fertility and hatchability. Now these three causes run the value of fall chicks up to a higher mark than most people are willing to pay. That is why the breeder makes no outcry about selling fall chicks. His would-be customers would expect to get them at summer prices and he can get more money with less labor out of his eggs."

Henry Johns writes: "I am now thoroughly interested and determined to try out the fall hatching plan, but I must acknowledge that when I read your first article in the Pacific Rural Press I was surprised at its contents, for the reason that it did not seem natural for the baby chicks to thrive in fall and winter. I have recently talked with several people who had formerly at one time or another hatched chicks in the fall in a limited way, and all stated that it was not difficult and that the results were satisfactory. In looking through the various journals with a view of buying either eggs or chicks this fall, I noticed an item in the Petaluma Weekly Poultry Journal of July 7 which you might wish to reproduce. The pullets mentioned were evidently hatched about October 10, 1914. This is the item:

"'Alex Lanoir, a successful poultry raiser who resides near Petaluma, has twelve White Leghorn pullets which are making a good showing in the way of egg production. Beginning Feb. 26, they laid 836 eggs up to July 4. They started to lay when about four and a half months old; and if they keep up as they have done, they will be some good birds. These pullets have not been forced for egg production, but have merely been kept separate from the rest of the flock and a record kept of their laying.'"

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

From all quarters of the country word is coming in that the season of 1914-15 has been the poorest in many years for poultrymen of all kinds, but worse for the fancier than the rest.

Improvement Depends on Fancy.—When the fancy is driven to the wall, what have you left for the rest? The fancy is the backbone of poultry husbandry and until we had a good showing of fanciers—men and women who are willing to spend money and give time to try things out that promise better things for the whole—it was not a business.

There is a mistaken idea as to what are "utility" fowls. Of twenty inquiries I have received from average people, all want "utility," not show stock. This is because, as a rule, they are misinformed as to what utility and show stock means. They do really want good stock; if they did not, they would inquire about stock from the man who keeps any and all kinds, and can sell cheap accordingly.

Now my opinion of "utility" is a fowl that answers every purpose. If you have a hen that trapnested gives you 240 eggs in a year, then goes into the show room and scores 95¼ under a well known judge, you come pretty near having an all around utility hen. Then if nobody feels like giving a decent price for such a hen to breed from and after keeping her long enough to get all useful service out of her you can turn her off as ten pounds of chicken at 19 or 20 cents a pound, then you have a utility hen in very truth, a hen that has looked handsome all her life, thus giving her owner pride in the ownership and aspiration to breed more like her, and a hen that brings a fair price when the last touch comes.

When a person tells me that to him "a chicken is simply a chicken and nothing more," I tell him honestly that we can't make a deal, and that I have no desire to take his money.

Pay for California Stock.—The past season I have sold chickens at "utility" prices that could hold their own in almost any show on this coast, and whose sires cost me big money that no Californian would pay to me, yet if they sent east for the same quality they would pay it and think they had a bargain. This is one feature of the business that is not adjusted right. No easterners send money here for either eggs or stock, yet all eastern judges say we "have the goods" on the East because of our climate.

If it were not for the fancy, the poultry shows, poultry papers, and progressive farm papers, there would be very little interest in the poultry business, and it would fall back into the old groove when farmers kept a few dunghill fowls and let them scratch for a living. As a matter of fact the fanciers can't stand the racket: and a lot will have to go out of business if things do not change.

Score Cards Interest Amateurs.—Harry Collier, in "American Poultry Journal," says the blame for the hard times with fanciers lies in the style of judging. Score card judging, says Mr. Collier, is the only way by which the amateur can be kept interested in the game, and it is the amateur that is the backbone of the fancy. "Comparison shows end with the winners, they get all the glory." the amateur gets nothing, not even knowledge.

The amateur brought his birds to the show, not because he expected to win the blue, but because he hoped to gain the knowledge of his birds' weaknesses and failures. He does not come any more; because he knows he can't compete with the winners, and he gets no information by looking at the birds as they are cooped before him. And from experience I know he is right. One can't tell by looking at a bird just what he lacks to make him a winner, unless one knows the inside. I once had a beautiful Buff Orpington bird at Petaluma show; and when I went into the show room the old fanciers commenced to congratulate me on having "first" cock in Buffs. I asked if the judging was done and they said, "No, but there is nothing here that can touch your bird." I said "Well, I won't get the swell head till the judge says so." I knew what that bird would get when the judge handled him, and he got exactly what I expected. Some of the folks wanted me to protest, but I knew where the bird was weak and they did not. To all appearance he was perfect, but was imperfect in one thing, and that defeated him.

The comparison judge does not instruct the exhibitor as fully as the score card judge; the score card is there to refer to when the amateur is mating up his flock and if one of his birds shows a weak point he can put a male in that is strong where

BELGIAN HARES—Young stock for sale. Hurd Bros St. Helena, Cal.

the hen is weak. In that way, of course, the score card show is helpful, and with Mr. Collier I think it creates more interest in the amateurs, those who are just bordering on the fancy and need some encouragement. Every human being who is trying to do things better is worthy of encouragement and should have it.

Hens Molting.—My flock of hens had run of large alfalfa field; they are now confined to large, well-shaded yards, and in spite of increased feed the egg yield has dropped and the hens are beginning to molt. Am told that shutting hens up at this time of year is unnatural, and that hens will molt again this fall.

As far as that goes, the shutting up at any time of year is unnatural, and I fail to see any difference in time. The molt is most likely the result of a combination of causes, one of them being the change from bugs to bloodmeal. The hens will molt again, but not likely in the fall; it will be most likely to occur about late December or January and if they molt thoroughly now the other will only be a partial molt. The best thing you can do is to feed them well. Give plenty of green feed and get them through the molt as quickly as possible. Then you will have eggs just about the time they are worth collecting and keep them at it as long as possible.

Selecting Layers.—Can good laying hens be picked out, with any degree of certainty, from three-months-old pullets, or at any time, by the system of measuring between the pelvic bones? If not, which is the only reliable system?

No; the best you can do is with pullets near five months old, and pelvic bones is only a small part of the knowledge needed to pick out the layers. Get the Hogan system. It was advertised in the Press; don't know if it is yet, but write to Walter Hogan, Petaluma. He is the originator of the system which has been put in book form, and is perfectly reliable.

POULTRY NEWS NOTES.

T. E. Quisenberry, Sup't. of Poultry at the Exposition, is on a trip to the eastern states. He is due to return about July 24.

A proclamation by the Governor July 1 removes the quarantine restrictions that have for some months prohibited the movement of poultry into California. Domestic fowls may now be shipped into this State from any other state without permit or special formality of any kind.

A pen of purebred Rhode Island Red fowls bred by J. L. Harrison of California, finished the Queensland, Australia, egg-laying contest with a yearly average of 229 eggs. This demonstrates that fowls may be strictly fancy or show birds and at the same time may be the highest type of utility fowls. This is as it should be, but it is up to the poultry show managers to furnish the buying public with some sort of certificate which includes the utility rating of prize-winning fowls if the interest in poultry shows is to be encouraged.

AMERICAN AUTOMOBILE BILL

On June 1, 1915, the number of automobiles in the United States for the first time reached 2,000,000. Figuring on an average of four persons to each car, which is very conservative, there are 8,000,000 people in this country in daily enjoyment of motoring. What it costs to follow this sport is of interest, because of the stupendous figures involved. To run 2,000,000 cars for one year requires at the very least 1,000,000,000 gallons of "gas," worth $130,000,000; 20,000,000 gallons of lubricating oil, worth $8,000,000; 12,000,000 tires, worth not less than $16 apiece, or $192,000,000; accessories and extra comforts, goggles, gloves, and caps, $50 per car, or $100,000,000; garage charges on short tours (exclusive of gas and oil), $100 per car per year, or $200,000,000; repairs made necessary by wear, tear, and accident (exclusive of tires), $50 per car per year, or $100,000,000. Total running expenses for all cars in use $730,000,000. Add thereto the value of the 600,000 new cars purchased during the year, at an average price of $750, or $450,000,000, and we get the immense total of $1,180,000,000 spent in a single year (1915) on the sport [and business] of motoring.—Scientific American.

GETTING BEES OUT OF HOUSE.

To the Editor: How can I get rid of bees that persist in occupying the inside of my house.—H. B., Penryn.

[Answered by J. D. Bixby, Western Honey Bee, Covina.]

[The worst possible plan is to attempt to stop up all holes, to confine them; it can rarely be done. I have known bees to crawl 30 feet through the frame-work of a house and find an exit. If the brood-nest can be gotten at without too much damage to the building, the best plan is to cut out all combs and honey, destroy the bees by spraying with gasoline or distillate, and paint all adjoining woodwork with crude oil before replacing the siding or shingles. If this is not feasible, get a "bee-escape" from the nearest bee-supply house. Bore a ¾-inch hole into the bee nest as near as possible to their natural entrance and tack the bee escape over it. Stop up all other holes near with rags or putty. This contrivance allows one bee to emerge at a time, but none can return. When a bunch of bees has gathered over the escape, spray them with gasoline which will kill every bee. You will need to repeat this several times the first day, after that with decreasing frequency. In about three weeks, all will be gone, the escape can be removed, and all crevices closed with putty. The honey and comb inside will soon be destroyed by moths. Bees in chimneys can be destroyed by making a small fire and throwing on a handful of sulphur.]

ARIZONA CLOD MULCH.

In one of the dry farming districts of Arizona, County Farm Adviser A. L. Paschall is making a special effort to get the farmers to plow and summer fallow a portion of their land to be planted in winter crops next fall. It is believed that by plowing the land deeply sometime in June considerable moisture will be caught and retained from the July and August rains. It is recommended that after the first rains a disk harrow be run over the land followed by a spike-tooth harrow. Thereafter, following every rain, it will be desirable to cultivate. A special attempt will be made to maintain a mulch containing small clods—not a dust mulch. It has been found by the U. of A. Agricultural Experiment Station that a dust mulch is soon beaten into a hard mass by the pelting rains of July and August and the balance of the rainfall runs off, whereas a clod mulch is broken into smaller pieces and readily receives and holds the moisture without losing it by run-off.

California Poultry Practice

Written to Teach Better Poultry Methods on the Farm.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poutry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers

The Home Circle.

THE FOUR-LEAF CLOVER.

A little maid in a gingham gown
Went hunting the meadows over;
Till the birds were tired, and the sun went down,
She sought for a four-leaf clover!

For four-leaf clovers bring luck, they say;
And patchwork "stints" and dishes
Were tiresome duties every day.
She wanted some fairy wishes!

With dishes unwashed and "stint" undone
She trampled back home in the gloaming;
No four-leaf clover — no, never a one—
Was there to be had for her roaming!

A little maid in a gingham gown
Had washed all the dinner dishes,
Had finished her "stint" ere the sun went down,
Undreaming of fairy wishes,

When just at her feet, as she raced in play
The blossoming meadows over,
She found what the other had sought all day—
She found, yes, a four-leaf clover!
—Mary Clarke Huntington.

MISS BARBARA'S RASPBERRIES.

"I do hope that boy over at the uext house won't be troublesone," Miss Barbara murmured as she and Miss Julia carefully carried in the parlor lamp. "I just can't have him running out and in here half a dozen times a day tracking in dirt."

Miss Julia's words and tone were assuring. "If we don't take any notice of him whatever, I don't believe he'll trouble us."

So Robbie watched and waited in vain for an opportunity to make the acquaintance of his new neighbors.

When the goods were unloaded, the truck man went away with his span of white borses and big wagon. Miss Barbara and Miss Julia went into the house and shut the door, and the boy, who had been standing on the steps of the next house, went in to talk with his mother.

"They don't look half so nice as Mrs. Royce," he told her.

"But you cannot always tell how good and kind a woman is by her looks," his mother counselled.

"Who do you suppose will have the raspberries now?" Robbie asked after a pause.

"I think the new neighbors will want the berries themselves," his mother replied.

Down on the bank at the back of the house where Mrs. Royce had lived was a thrifty black-raspberry bush, and, as Mr. and Mrs. Royce did not care for the berries. Mrs. Royce had given Robbie leave to pick them whenever he liked, which was a privilege that he greatly appreciated.

Brother Roger and father were talking about Godfrey de Bouillon, about whom Roger had been reading, and Robbie's attention was attracted, for he always liked to hear about great men

How grand the Crusaders must have looked, marching along, shouting their war-cry, "It is God's will," each man with a red cross embroidered on the right shoulder! Robbie and mother talked about Godfrey de Bouillon when father and Roger had gone to town. Robbie asked a good many questions about the great Crusader who was willing to forgive an injury to himself if good might come thereby.

"I think it's almost as hard to forgive people when they treat you badly as it is to fight battles," Robbie said thoughtfully.

Robbie spent that morning working in his flower-beds at the back of the house. There was a little strip of land at the back of Robbie's house and the house where Mrs. Royce had lived, where flowers grew luxuriantly. Mrs. Royce gave Robbie a little set of gardener's tools, divided her packages of flower seeds with him, and taught him how to plant the seeds the first year that she lived in the cottage; and since that time he had been an enthusiastic gardener. In the afternoon he thought he would go down on the bank just to see if the raspberries were ready to be picked. As Robbie stood looking at them he wondered if the new neighbors had noticed that the berries needed picking. Then he picked one and ate it; it was delicious. He picked another and ate that, and then another; and then—then some dreadful cold thing came dashing with such force as almost to knock him down. He screamed, and turned to meet Miss Barbara with an empty water-pail in her hand.

"Why, are you here?" Miss Barbara asked in well-feigned surprise. "You better keep right away from this raspberry bush, for I'm going to take the best of care of it. I presume I shall wet it every day this warm weather, and you'll be liable to get wet again if you're over here."

Robbie did not wait to hear more. He ran for home as though for his life. When he reached his mother's arms he cried as he had not cried for a long time, and between his sobs his mother could distinguish these words: "I hate the stingy old thing! Yes, I do!"

Miss Julia met Miss Barbara as she same in at the back door.

"What did he say? I saw you gave him a good wetting."

"He didn't say anything, but he made tracks for home, and I think he'll stay there now."

"But don't you suppose his folks will be dreadfully put out about it?" Miss Julia asked apprehensively.

"If they keep on their land, I shan't trouble them; but just as long as we pay our rent here we're going to have what belongs to us, and we're not going to be troubled by boys, either," Miss Barbara replied in a very decided tone.

Somewhat later the two ladies were greatly surprised to see the "troublesome boy" coming up the front walk.

"What on earth can he want now?" Miss Barbara ejaculated.

There was a timid knock at the door, and Miss Barbara answered the summons. There were still traces of tears on Robbie's face, but he spoke bravely.

"I didn't pick but just three of your berries, but of course I hadn't any right to touch one. Mrs. Royce didn't care for black raspberries, and she always gave them to me, so I guess I was so used to picking them I didn't think; but I won't never do so again. I thought you must be real busy, seeing you've just moved in; and won't you please let me pick the rest of them for you to make up for what I ate? I won't eat one single one of them," he added impressively.

228-238 Central Ave. SMITH-BOOTH-USHER CO. Los Angeles, Cal.

Miss Barbara stared in astonishment.

"We are pretty busy, but I guess we can find time to pick them ourselves," she said hesitatingly.

"But I want to make it right, and I can't think of any other way; and I wish you'd let me do it," Robbie pleaded.

And Miss Barbara surprised herself and her sister by saying, "Well, if you want to so bad, you may."

Then she brought a bright tin dish from her pantry for Robbie to pick the berries in. After Robbie left the house, the sisters looked wonderingly at each other. Then Miss Julia broke the silence.

"He's a perfect little gentleman! But I should think he would not have dared to come over here again. Don't you suppose he hated to?"

"I don't believe he enjoyed it very much," Miss Barbara said meditatively.

Oh, Miss Barbara, you never dreamed how hard it was to come.

When Robbie came in, the dish was heaping full of berries. "I picked every one that was ripe," he said smilingly.

"I think you must have," Miss Barbara replied. "I want you to take some of them home, for you have more than paid for the few you ate."

"Oh, I don't want to, indeed I don't!" Robbie protested earnestly.

Miss Barbara could see that he meant what he said, so she forebore to urge the matter; but as Robbie was about to go home she said apologetically,—and it was a very unusual thing for Miss Barbara to apologize,—"I guess you're a real good boy after all, and I'm afraid I was too hard on you; but I know we shall be friends hereafter."

"Here comes a conqueror, I am sure," mother said, with one of her brightest smiles, as she opened the door for Robbie when he returned.

"Yes, I conquered. It was awful hard to do, almost as hard as some of Godfrey de Bouillon's battles, I guess; but I'm so glad I did it, for she says we're going to be friends."
—Jessie L. Britton, in the Presbyterian Banner.

"Somebody said that it couldn't be done,
But he with a chuckle replied
That 'maybe it couldn't,' but he would be one
Who wouldn't say so till he'd tried.
So he buckled right in with the trace of a grin
On his face. If he worried, he hid it.
He started to sing as he tackled the thing
That couldn't be done, and he did it.

DESIRE UNBOUNDED.

Recruiting Officer — You want to enlist, eh?

Irish Recruit (enthusiastically)—Yes, sir—for the duration of the war, or longer if it lasts!—London Opinion.

"What are your plans for the summer?" "Further exploration, I suppose," answered Mr. Muvings. "I am going to keep on looking for some place that carries out the impressions I get from the pictures of the summer resort postcards."—Washington Star.

A cupful of liquid yeast is equivalent to half a compressed yeast cake or a whole dry yeast cake.

PROPER METHOD OF STEWING MEATS.

Select the tough pieces of meat for stews. One important fact that Miss Mary Sutherland of the Home Economics Department of Washington State College is endeavoring to impress upon the housewife is the fact that a cheap piece of meat which contains much refuse may be much less economical than a higher priced one, all of which is eatable. Cuts which may be used are usually selected from beef, lamb, mutton or veal; such as the plate, naval, neck, shoulder, lower part of the round skirt steak, aitchbone, etc. Stewing is a method of preparing meat by extracting juice to flavor gravy, and retaining the juice in the remainder by searing the meat. Wipe the meat and cut into suitable pieces for serving. Meanwhile, divide into two portions, add one portion to cold water and heat to the boiling point. Set the other portion by browning in a little fat in a frying pan. Then add it to the water and meat. The whole should be cooked slowly for three hours, or until the meat is tender. Meat with some bone and fat makes a richer stew than one made with lean meat. Onions, turnips, carrots, parsnips and potatoes are the vegetables commonly used in stews. The vegetables should be cut into half-inch cubes or quarter-inch slices and added the last hour of cooking. The potatoes should, however, be parboiled five minutes, then added to the stew, allowing twenty minutes for the cooking. Sweet herbs, parsley, a bit of bay leaf, one or two cloves, celery salt, or catsup may be added to give variety. Salt and pepper are the usual seasonings. A nice way is to cook the vegetables separately.

Beef Stew—2 lbs. beef, 3 tablespoonsful flour, water, 1 turnip, 1 carrot, 2 onions sliced, 4 potatoes, salt and pepper, half bay leaf. Prepare according to above directions.

Place of Meat in the Diet.—Authorities seem to agree in the estimate that in the United States about one-third of the total expenditure for food materials is for meat. They also agree that when the total expenditure is one-sixth for meat the dietary will be more economical and also better balanced.—A. A. C. Bulletin.

AN INVIDIOUS INQUIRY.

It is related of the president of a famous college that at one time he allowed his wife to persuade him of the uselessness of fire insurance on household goods, and he allowed his policy to lapse, says the Circle Magazine. But better judgment asserting itself, he finally renewed his insurance. The same day a fire in his wife's rooms destroyed some of her dresses, which the professor enjoyed as a good joke.

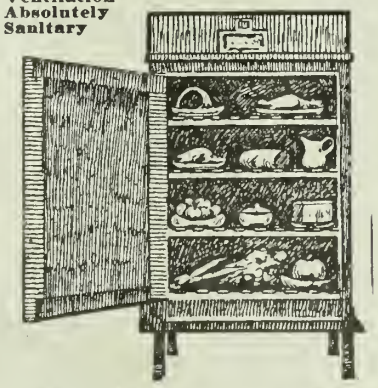
In due time the president of the insurance company wrote President Blank this letter:

"Dear Mr. Blank—We inclose check for $500, paying your fire claim under our policy B6007.

"I note in passing upon these papers that the policy went into effect at noon, December 10, and the fire did not occur until 3 p. m. Why the delay?"

When frying mush it improves the crispness if the mush is dipped in white of an egg before frying.

TWO ANGLERS.



A barefoot boy,
A white birch pole;
A can of worms,
A swimming hole.
A baited hook,
A tug and swish;
A steady haul,
A string of fish.

A white duck suit,
A canvas boat;
A costly rod,
A patent float,
A gaudy fly,
A cast and swish;
A pretty sight,
But nary fish!

Is Your House Over-run With Ants?

Read the Following Simple Method of Exterminating This Plague.

A house over-run with ants is not a pleasant proposition, but it is not the serious matter that it used to be. There was a time when it was practically impossible to rid a house of ants. Now, however, it is comparatively a simple matter.

This is due to the fact that a paste has been discovered which appears to have an almost supernatural power over ants. It not only drives them out of a house or store immediately, but keeps them out afterward. Thousands of enthusiastic testimonials bear evidence as to its efficiency.

This remedy is being put up for general use under the name of Kellogg's Ant Paste and can be obtained at all druggists. It is the little sentinel which will guard your house against ants. Try a package today and be convinced.

STANDARD OIL COMPANY
(California)
San Francisco

The Markets.

Unless otherwise noted prices are f. o. b., San Francisco.

San Francisco, July 14, 1915.

WHEAT.

The market has revived somewhat during the week. With improvement in the export outlook, eastern markets have advanced, and local milling interests have been buying. Locally practically everything is higher.

Cal. Club, ctl	1.72½ @ 1.75
Forty-fold	1.75 @ 1.80
Northern Bluestem	1.85 @ 1.90
Northern Club	1.72½ @ 1.75
Northern Red	1.75 @ 1.85

BARLEY.

There has been some inquiry for export, and from all indications the market has reached bottom. Offerings are coming out slowly, and fairly large spot sales have been made at a material advance over the last quotations.

Choice Feed, ctl	$1.10 @ 1.12½

OATS.

There is very little movement in oats at present, but there is a good deal of inquiry from Australia, which is expected to send the market up very soon. Old stocks are light, and there is little new stock offered yet.

Red Feed	$1.35 @ 1.45
White	1.45 @ 1.50

CORN.

The corn market is very quiet locally with light offerings of California stock and no heavy demand. Occasional shipments continue to appear in the Orient.

California Yellow	$1.75 @ 1.80
Eastern Yellow	1.80 @ 1.85
Milo Maize	1.75 @ 1.80
Manchurian	1.40 @ 1.60

BEANS.

No further change in local prices is noted, but the values are practically nominal, the price actually paid depending on the conditions surrouding each transaction. Business continues very quiet, and offerings appear sufficient for current needs, though any large inquiry would be likely to cause an advance. It is still too early to get much of a line on the new crop.

(On Wharf.)

Bayos, Cal., per ctl.	$3.50 @ 3.75
Blackeyes	5.50 @ 5.65
Cranberry Beans	3.50 @ 4.00
Horse Beans	2.25 @ 2.75
Small Whites	4.00 @ 4.15
Large Whites	3.75 @ 3.90
Pink	3.15 @ 3.40
Limas	4.00 @ 4.15
Red Kidney	4.90 @ 5.00
Mexican Reds	4.90 @ 5.00

SEEDS.

(Wholesale prices, San Francisco.)

Alfalfa	17½ @ 18½c
Brown Mustard, per lb	Nominal
Canary	10 @ 12½c
Hemp	3 @ 3½c
Millet	2½ @ 3 c
Timothy	7½ @ 8 c

HAY.

Arrivals here were light for a few days, but are now increasing again. They still consist mainly of old hay, most of it of rather poor grade, and does not move off very readily; though choice lots sell readily at somewhat better prices than have lately prevailed. Some new hay is moving at about the same price as old. It is reported that local consumers have not yet started to buy on a large scale, and a more active movement may accordingly be expected later on. Buying in the country is limited, buyers showing a disposition to hold off a little. Alfalfa from the river district is very fine in quality, and finds a good market.

(Prices per ton, carload lots, on track, San Francisco.)

No. 1 Wheat, per ton	$10.50 @ 12.00
do. No. 2	8.00 @ 9.00
Barley	6.00 @ 9.00
Tame Oats	7.50 @ 11.50
Wild Oats	6.00 @ 8.00
Alfalfa	6.50 @ 9.50
Stock Hay	5.00 @ 5.50
Straw, per bale	.40 @ .45

FEEDSTUFFS.

Rolled barley is slightly higher, corresponding with the advance in the whole grain. Other lines show no change, and current business in most lines is rather quiet.

(Wholesale prices per ton, carload lots, San Francisco.)

Alfalfa Meal, ton	$14.00 @ 15.00
Alfalfa Molasses Meal per ton	18.00 @ 19.00
Bran, per ton	29.00 @ 30.00
Oilcake Meal	None here
Cocoanut Cake or Meal	25.00 @ 26.00
Cracked Corn	40.00 @ 41.00
Middlings	34.00 @ 36.00
Rolled Barley	24.00 @ 25.00
Rolled Oats	33.00 @ 34.00

VEGETABLES.

The local demand for garden truck has picked up for the last few days, but large offerings in many lines have prevented any marked improvement in prices. The best offerings of string beans are doing a little better, though there is still plenty or ordinary stock. Celery is now coming in from the South, and brings higher prices; while lettuce from the river district is lower. Supplies of asparagus have been considerably in excess of requirements, selling down to 75c, with canners' prices even lower. Peppers have dropped sharply, with ample offerings from nearby districts, and eggplant is quite cheap, while cucumbers have stiffened up a little. Green corn is moving well, but the best will not bring over $2 per sack.

(Wholesale prices, San Francisco.)

String Beans, lb	1½ @ 4 c
Lima Beans	5 @ 8 c
Celery, So., doz	75c
Lettuce, crate	50 @ 1.00
Asparagus, box	75 @ 1.00
Peas, sack	1.00 @ 2.00
Peppers, bell, lb	4 @ 6 c
Tomatoes, crate, Merced	50 @ 75c
L. A., lugs	1.50 @ 2.00
Rhubarb, box	50 @ 65c
Cucumbers, lug	90 @ 1.25
Eggplant, lb	3 @ 6 c
Summer Squash, lug	20 @ 50c
Green Corn, sack	1.00 @ 2.00
Okra, crate	.75 @ 1.25

POTATOES AND ONIONS.

The Stockton potato market is developing some activity, with large shipments to northern markets, though prices show no improvement. Onions are moving slowly, but prices are a little better, as some growers have withdrawn their offerings from the market.

New River Potatoes, ctl	75 @ 1.10
Onions, yellow, sk	60 @ 70c
Red, sk	60 @ 70c
Bermudas, crate	85 @ 90c
Garlic, per lb. new	5 @ 6c

POULTRY.

Eastern stock is again rather plentiful, but local offerings are coming in slowly, and while the demand is nothing extra values are pretty well maintained. Broilers have been marked up a little, and extra hens are firm. Ducks are weak, while Belgian hares have been marked up a little.

(Wholesale Prices, San Francisco)

Live Turkeys, lb	15 @ 17 c
Broilers	21 @ 22 c
Fryers	21 @ 23 c
Hens, extra, per lb	16 @ 17 c
Small Hens, per lb	13 @ 14 c
Smooth Young Roosters, per lb.	24 @ 27 c
Squabs, per doz	$2.00 @ 3.50
Geese, per pair	2.00 @ 2.50
Ducks, young, lb	13 @ 14 c
Old	12 @ 13 c
Belgian Hares	7 @ 8 c

BUTTER.

Arrivals from the north continue very heavy, and caused a ½-cent decline in extras for a few days. With further export orders to be filled, however, no continued weakness is expected.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	26½	26	26	26	26½	26½
Prime Firsts	25	25	25	25	25½	25½

EGGS.

The firmness following the holiday has given way to a rather easy feeling, with lower prices on extras, as arrivals from nearby producing points have been very heavy.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	26	26	24½	24	25	25
Firsts	21½	21½	21½	21½	21½	21½
Sel. Pul.	22	22	22	21½	23	23

CHEESE.

Monterey cheese is lower again, with excessive offerings. Fancy flats show a ½-cent advance, the first change in some time.

S. F. Dairy Exchange prices on flats and Y. A.'S)

DECIDUOUS FRUITS.

Seedless grapes find a strong demand, and clean up readily at an advance, while malagas bring still higher prices. The berry market is off again for most lines, black logans being very cheap, while good reds are higher. Strawberries and blackberries are much lower, while currants have advanced sharply. Cherries are about cleaned up. Plums are steady as before, and figs have advanced sharply. Good apricots in lugs are lower, with large arrivals, and bulk peaches are also plentiful and fairly cheap. Offerings of cantaloupes dropped off somewhat, bringing higher prices, though larger supplies are expected. Watermelons still bring fairly high prices for this time of year.

Loganberrics, blk, chest.	$1.00 @ 2.00
Loganberries, red	3.00 @ 5.00
Strawberries, chest	3.00 @ 5.00
Raspberrles, chest	4.50 @ 7.00

Watermelons, lb	½ @ 1½c
Grapes, crate, Thompson Seedless	1.25 @ 1.75
Malaga	1.50 @ 1.75

DRIED FRUITS.

Local packers are still holding off in regard to new-crop purchases, taking only what they can pick up at low prices, and growers as a rule are not disposed to force the market. The distributive trade is operating conservatively, as for some two years past, and there is a lot of low-price talk going around. Current offers for new prunes are even lower than before, which seems strange in view of the heavy demand for spot goods for England. In fact, it is expected that considerable forcign business will develop for various lines of dried fruits. A steamer leaving for England the first of the month took about 133 tons of peaches, in addition to substantial lots of apricots, prunes and apples. New apricots are being shipped, and sell within the range quoted. The outlook for peaches is still very doubtful, with prospects of an unusually heavy dried pack and little demand. Seedless ralsins are in strong demand, and higher prices are offered in some quarters. The New York Journal of Commerce says:

"A strong market still prevails in spot prunes, hut there is little change in the conditions which have characterized the market since the first of the week. The advance in prices which was made by one of the principal holders of prunes both here and on the Coast yesterday still holds and the inside price of 10c for California 40s to 50s is probably very hard to find. The price on this size which the largest holders are asking of the buyers is 10¼c.

"European inquiry continues to come in and sales are in prospect. English brokers, it is said, have shown no inclination to lose their interest in this market and are expected to be buyers of the new crop when it arrives here about the middle of October. Until then the supplies which are sold must necessarily be of small quantities as the stocks here under the steady sales of the past week have been diminished considerably. California 40s are apparent in about as large quantities as any size in spite of the inroads which have been made in the last few days on this favorite size. The sizes below 60s are becoming very scarce and only minor trading is being done in them as a result.

"Fancy seeded raisins are strong and the tendency seems to be an upward one. The European demand has taken care of quite a share of the available spot stocks, and inquiries continue to come in, which brokers feel confident will develop into sales within a short time."

(Prices to Growers.)

1915 crop.

Apricots, per lb	5½ @ 7 c
Figs, white	3¼ @ 3½c
Black	2¼ @ 3 c

Prunes, subject to dist.	3¼ @ 3½c
Peaches	2½ @ 3 c
Pears	5 @ 8 c

CITRUS FRUITS.

The eastern auctions are paying good prices for Valencia oranges, though there has been a drop of 10 to 15 cents per box. Lemons are very low—the prices received on auction being below the cost of packing and transportation, in some cases.

At New York on Monday, July 12th, Valencias averaged from $2.80 up to $4.40 per box; Navels averaged $1.55 up to $2.20; St. Michaels $3.20. Lemons sold as low as 90 cents and up to $1.90 per box. A few days of hot weather in the East are needed to remedy the lemon situation.

Shipments from southern California for the season to July 11th, were, oranges 29,426 cars, and of lemons 4,900 cars, as against 31,817 cars of oranges and 2,251 cars of lemons to same date last year.

San Francisco prices are held as last quoted, Valencia oranges finding a very fair demand even at the advance, while grapefruit and lemons are moving freely.

(Wholesale Prices, San Francisco.)

Oranges, Valencias, bx.	$2.75 @ 3.50
Grapefruit, seedless, box	2.00 @ 2.25
Fancy	2.50 @ 3.00
Lemons, box	1.50 @ 3.50

NUTS.

Spot offerings of all lines are very closely cleaned up, and even occasional lots of rather unattractive appearance have been disposed of to advantage. It is too early to say much of the outlook.

(Prices f. o. b. San Francisco.)

Almonds, 1915 crop:

HORSES.

There is not much feature to the local horse market, perhaps owing to the vacation season. Little stock is coming in, and there is no urgent demand for anything here, though desirable heavy stock is disposed of without much difficulty.

(Approximate values at San Francisco, based on auction sales.)

Heavy drafters, 1700 lbs. and up	$275	@	300

SPECIAL DECIDUOUS MARKET REPORT.

By J. L. Nagle, Sacramento, July 13.

The expected slump in the Eastern markets occurred almost immediately after the Fourth of July. This slump was more noticeable east of the Missouri River, due principally to the fact that shipments from the Eastern states are now arriving in heavy supply, though the varieties are confined almost exclusively to white peaches. This slightly stimulated the demand for yellow peaches, but this demand was confined to the middle west markets.

Elberta peaches from Georgia, Texas, Oklahoma and Arkansas will be moving this week on account of California being two weeks late, the enormous tonnage the Eastern states will contribute will more seriously affect shipments from this state from now on for the next three weeks than any condition that has prevailed to date. We look for extremely low prices on California Elberta peaches. The same condition will govern other deciduous fruits more or less.

Blue plums seem to have the first call, and good-sized, well-packed Bartletts will meet with a ready demand, but we do not look for any relief from present conditions until after the 10th of August.

Our advice to growers is to pack nothing but the best quality of fruit and confine their grades to large sizes.

Reports are current that mildew is developing in some sections of the Tokay districts, but hardly enough damage is expected to further affect the crop.

Early Malagas and Thompson Seedless are now moving in car lots from the Coachella and Imperial Valleys. The berries are good-sized and well sugared. We look for an active demand on grapes throughout the season if shipments can be regulated.

The following prices have ruled for the week:

New York—Tragedy Plums averaged $1.18; Burbank Plums, 83c; Formosa Plums, 90c; Climax Plums, 80c; Simoni Plums, 86c; Santa Rosa Plums, 97c; Wickson Plums, $1.90; Kelsey Plums, $2.20; Bartlett Pears, $2.52; H. B. Comet Pears, $1.85.

Chicago—Royal Cots, 98c; Triumph Peaches, 71c; Climax Plums, 82c; Burbank Plums, 75c; Tragedy Plums, $1.38; Red June Plums, 73c; Formosa Plums, $1.00; Santa Rosa Plums, $1.06; Simoni Plums, 91c; Wickson Plums, $1.06; H. B. Comet Pears, $1.40; Bartlett Pears, $3.00.

Boston—Alexander Peaches, 74c; Climax Plums, $1.00; Tragedy Plums, $1.50; Burbank Plums, 95c; Santa Rosa Plums, $1.33; H. B. Comet Pears, $1.25; H. B. Wilder Pears, $1.08.

Total shipments to date, 2205 cars; total shipments same date, 1914, 2817 cars.

THE SANTA CLARA VALLEY DRIED FRUIT MARKET.

A little more life is apparent in the dried fruit market than at last writing although there is not any quotable change in prices, with the exception of the price for the best apricots. Certain brokers express a willingness to give 7½ cents for fancy lots of cots but practically no sales are being made. Canners have bought a few cots at $20-$25 per ton, but many growers who have sold to canners in the past are drying their fruit. The fact that export agencies have sought prices on fifty carloads of dried apricots for France and on large lots of both prunes and apricots for export to England indicate that the export market is not wholly dead or dormant. Many apricot growers report attacks of the brown rot; in some instances a 10 per cent loss is feared. There is no change to report in the apricot pit situation, in fact the bulk of the pits in this valley have been sold.

To quote prices on prunes is difficult as there are practically no sales going on. In attempting to buy the packer asks the grower to state his price. When told that it is five cents or better the buyer leaves without making an offer. Almost absolutely no buying seems to take place. The prune aphis is still in evidence.

When a Certain San Francisco Shipper

announces to the trade that he will cut the Exchange's net or lowest price on new crop almonds, regardless of what that price may be, it serves as an object lesson to every grower who has been indifferent to the necessity of co-operative marketing.

CALIFORNIA ALMOND GROWERS' EXCHANGE,
311 California Street, San Francisco, Cal.

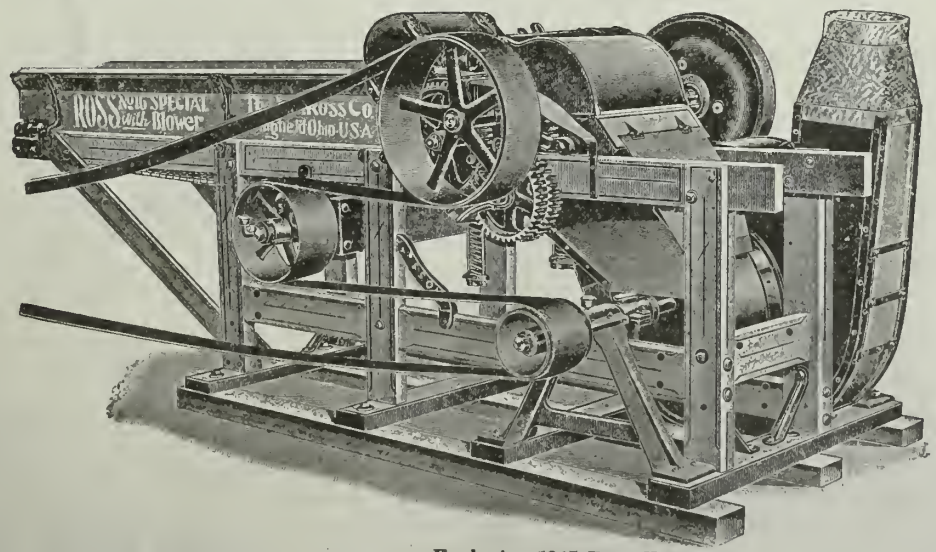
Publisher's Dept.

A letter received from G. W. Gibson of Willows states that: "Am selling a bull a week and sometimes two, and will change my ad. when times are worse."

One hundred and ninety-three new paid subscribers were added to our list during the past week, which is a fine record for the summer season. Our field is to be congratulated on doing fine work in all districts from Del Norte county to San Diego and from Santa Clara to the interior of Nevada.

Note the advertisement in this issue of the new book by Prof. Woll of the State Farm, on Feeds and Feeding of live stock. You ought to have a copy of this book.

Lieutenant G. S. Bryan, of the Naval Engineering Experiment Station, Annapolis, Maryland, in a paper published in the Journal of the American Society of Naval Engineers for February, 1915, says: "Oils made from asphalt-base crudes have shown themselves to be much better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are the paraffine base Pennsylvania oils. The carbon formed from the latter is, as a rule, extremely hard and clings to the metal surfaces, while that from the former is soft and can easily be wiped off any surface that it is deposited on. This would be expected from a consideration of the nature of the hydrocarbons composing the oil, and it has also been demonstrated in practice. The explanation lies in the fact that the paraffine-base oils are generally composed of the paraffine series of hydrocarbons, while the asphalt-base oils are composed mainly of the ethylene and napthene series. One of the characteristics of the latter two series as compared with the paraffine series is their tendency to distill without decomposition. Consequently, no gum will be formed on the cylinder walls, and the carbon liberated will be mostly discharged with the exhaust gases."



ONE VETCH AND ANOTHER.

To the Editor: I send you two specimens of forage. One is worthy vetch, the other is a cheat. Vetch here on our hill or orchard land is the most useful and valuable plant we can grow, making two good cuttings, and the last one can be used for the seed or it may be pastured all summer and grow every year as tall as six feet on hill land. It twines up grain sowed with it, fences, or young trees. If not cut or pastured, will raise a heavy crop of seed same as the second crop will and it should be sowed by every orchardist and farmer of Sonoma county. It has a bright pea-like bloom.

The other plant has been sold here the last few years for vetch. Whatever it is, it is not worth the name of vetch. It grows wild in many parts of the State and should stay wild and not be propagated as it is worthless. [illegible]loom of it, as you notice, all hangs on the under side of the stem and when it seeds it is very sparingly. For feed, my stock have run on it all summer and I cannot see that they have eaten a single stalk of it, and I am sure they will not. Many have been disgusted and have condemned vetch because they got the worthless stuff. While the seed resembles vetch seed, it is only half the size and has a very dull, doubtful apearance. The sale of it for vetch should be stopped.

Agriculture Horticulture Floriculture

By

E. J. WICKSON, A. M.

Professor of Horticulture in the College of Agriculture of the University of California; Horticulturist of the Agricultural Experiment Station; Member of the National Council of Horticulture, Etc., Etc., and Editor of the PACIFIC RURAL PRESS.

CALIFORNIA FRUITS AND HOW TO GROW THEM.

Price, $3.00, postpaid.

A Manual of Methods, which have yielded greatest success, with the list of varieties best adapted to the different districts of the State. Seventh Edition—Fully revised.

CALIFORNIA VEGETABLES IN GARDEN AND FIELD.

Price, $2.00, postpaid.

A Manual of Practice, with and without irrigation, for semi-tropical countries. Third edition—Revised and Extended.

CALIFORNIA GARDEN-FLOWERS, SHRUBS, TREES AND VINES.

Price, $1.50, postpaid.

Written with the hope of assisting flower lovers to attain greater joy and satisfaction in the common growing of flowers. The writer gathers suggestions from his own experience and enriches them with his observations and study of the work of others; but studiously avoids the perilous heights and the academic phraseology of the botanist as he does the devious methods of the commercial florist. A valuable and instructive book for the amateur flower gardener. First Edition.

ONE THOUSAND QUESTIONS IN CALIFORNIA AGRICULTURE ANSWERED.

Price $1.50, postpaid.

Consists of 1000 of the most important questions on every subject that have perplexed the farmer and which have been submitted to the editor. The problem appears with its solution by Prof. Wickson immediately following; a comprehensive index enabling the reader to find the subject which interests him without delay. The 1000 questions and answers cover Fruit Growing, Vegetable Growing, Grain and Forage Crops, Soils, Fertilizing, Irrigation, Live Stock and Dairy, Diseases of Animals, Feeding Farm Animals, Poultry-keeping and Pests and Diseases of Plants.

This is a book of reference that every farmer, no matter in what branch of farming he is engaged, should have on his shelf. First Edition.

These four works are written by a Californian who, for forty years, has made a study of Californian conditions, and who is recognized as the highest authority in the State on the subjects treated. They should be in the library of every California Farmer.

Growers Require Money on Delivery.

Proof That as Growers Really Co-operate Along Business Lines They Can Get What Money They Need.

[Written for Pacific Rural Press.]

MONEY makes the mare go.'' Money right now—not a month, three months, or six months from now. The falsified expression quoted may be due to the special need of spot cash by farmers, whose financial credit for borrowed money has been unnaturally restricted. Dilatory financing of members of co-operative associations, where crops could be sold to competitors for cash, is probably the greatest reason for lack of wider organization of farmers.

We were recently told by a dried-fruit packer about a large fruit-grower who is financially well off, could get any reasonable credit at his bank, has money loaned out to various parties all over the valley, but about the time the fruit is on the tray, he gets a fever, and helps along in the stampede to sell and get his money, though his stampede gets him less of it.

After investigating the failures of many co-operative organizations, R. E. Straborn, an Oregon railway president, told the Oregon State Horticultural Society: ''A tremendously strong reason for failure was found in the long period which usually elapsed between time of delivery of produce and the day of final settlement for the pool. Most farmers were not financially able to carry their expenses for the three to eight months' period which was usually required. They preferred to sell for cash at a less price, which often meant a losing price.''

Analysis of the systems of the State-wide co-operative associations of California shows that practically all of them pay more or less to their members on delivery of the crop, though there are still some whose members are compelled to wait until the closing of the pool, which may be a week, or three months, or six months.

Realizing the importance of this feature, after decades of co-operative organization funerals in the Fresno raisin district, a successful organization was evolved, having for its foundation, a crop contract whereby growers get a set price when the crop is delivered to the company. This is made possible by the very heavy capital stock.

It is of no use to raise good crops of any kind unless they can be marketed at a profit. Growers properly organized and well managed can and do regulate prices to a profitable level, in a better way than by pulling up the trees.

Walnut Growers Advance Money.—One of the most successful co-operative organizations of farmers in the West is the California Walnut Growers' Association, whose manager, Carlyle Thorpe, writes: ''I believe that the success of any growers' co-operative association depends to the greatest extent upon the association's ability to so finance its operations as to promptly pay the grower for the goods delivered.

''It is a peculiarity of the average California grower, but nevertheless a well-known fact, that he is very anxious for his money as soon as his crop or any part of it is delivered. All co-operative associations should endeavor to meet this requirement as nearly as possible. The value of public opinion should no more be overlooked by the management of a co-operative association than it should by the executive head of a government. With this important feature always in mind, the walnut association has so systematized its business as to enable it to pay its association members 90 per cent of the full association prices the minute each shipment of walnuts goes forward or is ready for shipment. Thus the grower secures a large per cent of the value of his walnuts within a week after he has delivered each load to the packing house.''

How Almond Growers Built Credit. — Another strong story of the growers' organization building up a remarkable bank credit in the face of persistent opposition, is told in Manager T. C. Tucker's own words:

''The California Almond Growers' Exchange was incorporated May 7, 1910, under the co-operative horticultural law of the State without capital stock.

''During 1910 the best financial arrangement that the Exchange could make was a loan of 50 per cent of the value of its drafts with shipping documents. The same arrangement was the best they could get for 1911. During 1912 the bank agreed to loan 75 per cent of the value of our documents. In 1913 this was increased 15 per cent; the bank agreed to loan 90 per cent. During 1914 the bank would loan not only 90 per cent against shipping documents, but agreed to loan 75 per cent against the goods in our warehouses, the value of the almonds being based on the

San Diego	0	0	0	80	60

THE WEEK.

Saturday, July 17, was the day fullest of emotions in the history of San Francisco—excepting, of course, the days of the great disaster. Not only were these emotions great in volume, but they were high in aspiration and sweet in quality—high and sweet, because they were the outflow of exalted patriotism from the American heart. All the lofty aims which actuated the founders of the republic, all the deep significances which have inhered in the motives and purposes of the preservers and promoters of the Nation for more than a century and a third, seemed to impress themselves most profoundly upon the thought of the million of Americans who gathered in the California metropolis on that day to honor the coming of Liberty Bell and to glorify the glorious things it stands for in the eyes of the world. It was a day of unparalleled enthusiasm and of unrestrained rejoicings—once seen, never to be forgotten. Three thousand miles from the birthplace of the republic, where in 1776 it rang out to the people the tidings that a nation was born upon the issue that "all men are created equal and that governments derive their just powers from the consent of the governed," Liberty Bell is now swinging beside the Pacific Ocean and announcing the same glad fact to all mankind. Probably all, who felt their hearts beat faster at the thought, realized that never before did the successful establishment of this nation mean so much to the world, and never did the token of the event impress the people so deeply. Hon. Champ Clark, Speaker of the House of Representatives, gave words to that fact when he declared, in his oration over the bell: "Now, thanks be to Almighty God! there are twenty-six republics in the world. In a large sense we made them, every one—not by the mailed hand, not by conquering armies, but by the wholesomeness of our example by teaching all creation the glorious fact that men can govern themselves." And of course every one thought of the sad state the eastern world has come into because of kingly and class domination, and therefore, how fortunate that the western world cast itself free from these oppressions when Liberty Bell rang out the Declaration for which it will be honored while brass endures. Every one thought also of the fact that the unspeakable miseries of the present war are due to people-trampling by ruling classes, and the cure for it is the same as that which Liberty Bell pealed forth in 1776. Dr. Jordan, speaking of the hopelessness of fighting the war to a finish, said this: "There is no such thing as crushing militarism out by militarism. The people only can save from militarism. Once militarism is out of the way there is nothing to hinder making a United States of Europe as firm as the United States of America."

And when that day shall come, as come it must if men are men, Liberty Bell will have its greatest pilgrimage to make. To that end the precious token will be most jealously guarded during its five months' sojourn at the Exposition.

Alfalfa, Raw and Manufactured.

Mention has been made in recent issues of large movement of alfalfa hay from California ports to Europe and to Australia. To the latter country we are glad to contribute help to save stock from the famine through drouth, and it is not to be discussed as an opening for California produce because Australia can usually grow all the hay she has any use for and more. The movement to Europe, which is being initiated this year with large shipments both by the Panama Canal and by rail for shipping from Galveston, is of alfalfa hay from the upper San Joaquin Valley. This is an outlet for California alfalfa which has been prophesied and anticipated to be a way by which over-supply of alfalfa can be avoided and prices steadied above the cost of production so that slumps like that of 1914 need not recur. The Atlantic seaboard and Europe can certainly use much California alfalfa, and now that cheap shipping by canal becomes possible, there is likely to be a good margin in it. Both as baled hay and as meal California alfalfa may be said to have a promising foreign field. But we should never forget that an agricultural country which ships out hay is on a toboggan toward loss of soil fertility. Some one may claim that this is not true with alfalfa, for alfalfa will make the soil richer no matter what you do with the top growth. Such a claim is a mistake. It is not so rapid in reducing fertility as when grains and grasses are cut for hay and sold off the ranch, is true; but land will become clover-sick and the alfalfa plant must have something else than atmospheric nitrogen and water to live upon. Selling alfalfa hay is therefore like selling other hay, except that it works on a slower schedule. It is a very easy, clean job to get rid of the stock and run the ranch for hay. It is so attractive that it has injured the land every time a great city has arisen and drawn its forage supply from the country. More than half a century ago Orange county was famous as the producing region of milk and butter for New York City, but the hay demand arose and the cows were chased out of Orange county Later, the same change struck the Mohawk Valley, and later still the cows were displaced in more remote parts of New York and New England. After the cows disappeared this nice, easy hay business ran for awhile, and then the "abandoned farms" sensation of the last decade appeared. Therefore, we say to those who are rejoicing over the expansion of a hay business, do not be too glad about it. It will be profitable for a time; perhaps for quite a long time on some lands, but the final result is sure, and when that comes energetic and expensive recuperative processes will be necessary to restore land which has been allowed to cheapen itself, until doubt comes in as to whether it is worth the taxes. The products to sell from an alfalfa ranch are breeding stock and meats of all kinds, wool, butter and eggs, etc, but not hay—except in moderate amounts. But if all the alfalfa goes into these products, and thus becomes manufactured and not raw, will there be a market for all that alfalfa should be made into? That is a question which we propose to discuss systematically in a series of special articles, by various writers who are especially informed; but in a word we say: "Yes—all the animals and animal products which California can produce will be well placed in the world." Why this is true will appear in later issues.

A Fundamental Reason.

Having thus referred the question we will not, of course, proceed to discuss it, but we can not help saying that the reason why all good animals will be better in California than elsewhere is because the growing conditions are better. All animals get quicker, more even and profitable development because, when properly handled, they go straight along without setbacks or handicaps. And we never say that without remembering a time when we were holding forth some years ago on that subject to a bunch of upper-class Germans, who were sent to California, by societies to which they belonged, to report to them whether what they were hearing in Europe about California was really true. It was on a stock farm near Stockton, and there happened to be a pigpen and a bullpen not far apart. Part of the visitors had their noses over the pigpen, looking at a fine boar, and the others were looking through the rails of the bullpen at a youngster who was charging around therein. The owner was between the two, shouting answers to each bunch as he could. It happened that a visitor on each side shouted out the same question at the same moment: "How much does he weigh?" The answer came loud and clear: "Twelve hundred pounds." The man who was looking at the pig straightened up, muttered under his breath: "Es macht nicht mehr als finf hunert pfund!" and marched away to an irrigation ditch, sticking his hand into it to see if the water was wet. All the rest of the day he was the most peeved German we ever saw. He could judge the weight of a pig; he had been lied to about it; probably he had been lied to all along; he would listen to nothing more.

But, fortunately, in this matter of superior growing conditions for animals in California there is testimony which cannot be controverted or misunderstood, for everybody will be looking at the same thing, and that the best in the world. At the Exposition, recently, the federal physicians in charge of the United States Children's Bureau made a thorough and comprehensive medical examination of sixty California babies, and after the last tot had been examined, Dr. Frances Sage Bradley of Washington, in charge of the bureau, paid her tribute to California as a baby-raising State in

these words: "We have kept careful records of all our examinations, and these show that in different parts of the country there is practically no difference in the average weight of babies at the time of birth. But the examinations we have made here show conclusively that the Western babies grow faster and get a quicker start toward robust health than the babies of the East. I am not surprised at what our examinations have shown, and it is only natural that the California babies should thrive wonderfully. Out here you have no tenement conditions to combat, and you have the best climate and food."

And the same conditions which make for the best baby men physically, make also for best domestic animals if they have artificial environment to match the natural conditions. This is California's first point of advantage in the animal industries as in world-beating manhood.

Another California Capability.

But while we contend that the same conditions make for the quick and ample growth of men, horses, horned cattle and swine, we are aware that we must put in a word to lessen the disgust of those who object to the grouping of babies with colts, calves and pigs. Our defense must be, of course, that the early physical development of a man fits him for his future work, just as the early growth of a domestic animal does, and it is the character of the future work which must involve the differentiation. The principles of early growth are the same, whether they enable the mature animal to haul a few tons of dead weight, to turn a few tons of forage into butcher's meat or dairy produce, or to make Californians greatest among mankind. And what do the philosophers say of possible attainments by those who are now, or may soon be, California babies? Professor Stockton Axson, brother-in-law of President Wilson and one of the foremost literary critics of the country, in his lectures at the Summer Session of the University of California, expressed this view of our approaching achievements: "Not because I am talking to a California audience, but because I really believe it, do I repeat a declaration I have made in the East, as well as here, that we may look to California for large things in literature. Western writers are free of the conventional restraints that I have found elsewhere. They have a daring that, though it may trouble effete critics, wins where it astounds. They are possessed of a simple forthrightness that combines well with a broad outlook upon men and things. I cannot help feeling that out of such fountains of literary creation as the Bohemian Grove, distinctly Western as it is, must come production worth while, sublimating the promising efforts which already your West has made." In fact, Professor Axson even acknowledges that he anticipates from Californians manifestation of that "epic quality" which has slumbered since the days of Dante, Goethe and Milton. And our contention is that, if Californians do attain such lofty heights in service of mankind, it will be not only because the California open-air life makes stature and breadth of physical frame fit to enclose daring freedom of thought and spirit, but because in the ancestry of California world-workers there has been stowed away great volumes of good foods—fruits, butter and cheese, fowl, fish and eggs, thick steaks and thin pork chops. It is therefore clear that not alone for triumphs at a baby show, but for the inspiration of the world, our leading forage product should not be hay for its own sake, but grass and hay for local manufacture into finished food products in great variety—foods which make men great for manly purposes in the world.

Queries and Replies.

Querists must give name and address.

Garden Training of Raspberries.

To the Editor: Kindly inform me if it is wise to trim raspberry bushes at this season, and if so how much? Of course ours are different heights—some are six feet long and some three or four.—A. C. H., Oakland.

The new canes which are now growing may be pinched or cut off at about four feet, or higher if you choose. Whenever a cane reaches the height you decide upon, pinch off the tip of it and this will give you uniformity, which improves the appearance of a garden row of raspberries. When stopped in this way, the canes will cease rising and will make side-branches or laterals on which your next crop of fruit will appear and these laterals give the plants a denser or more bushy appearance. To support them, they should be tied to stakes or to a wire stapled to posts in the rows. Later in the season the canes which fruit this summer should be cut away at the ground surface. They have finished their work.

Grading after Planting.

To the Editor: I have 20 acres of almonds set out this spring. Our ground is not level enough to irrigate properly. Do you think it advisable to level off between rows and make about a 4-inch border squarely in the row? Would this put the trees too deep in the ground? Our soil is rather heavy, yet I think it would seep through a small 2 ft. border.—Reader, McFarland.

This is a reminder of the advantage of preparing land for irrigation before planting—even if planting is delayed to do it. The danger to the trees by such subsequent leveling as you propose, depends upon how deeply they are covered and the character of the soil. In sandy soil they may stand several inches of covering; in heavy soils it is very dangerous to cover at all deeper than the root-crown. In such soils trees are lost every year by too deep planting. Sometimes land lies so that you can put in contour levees each spring and by dodging across the rows get a pretty even distribution of water in contour checks. Sometimes it is so hummocky that no even distribution can be had, except by using slip-joint pipes. If you decide to level the interspaces, we would rather let the rows go as they are than to fill around the trees—but that will give you an orchard surface for cultivation which will make you mad as long as you live.

Tomatoes Dropping Blossoms.

To the Editor: Can you give reason for a tomato plant dropping the fruit buds after they have blossomed out in a nice healthy flower? As soon as the petals wilt, the stem follows suit and the fruit drops off. The foliage has a rusty appearance in one spot but I do not know if that affects it. The rust does not spread.—Reader, Modesto.

The reason generally is that the plant is making too rank growth. If you push the plant to too active vegetative growth, by too much irrigation on rich soil or on too heavily manured soil, or if such soil is naturally oversupplied with moisture, you are apt to lose the blossoms and get no fruit until later in the season when the plant growth is slowed down. Therefore one should be very careful about using too much water; or, if the soil is naturally too moist, as on low land, planting should be made later—after these forcing conditions are reduced. Sometimes better setting of fruit can be induced by topping the plant—that is pinching or topping off the shoots, a distance above the bloom. Sometimes good results are reported by fertilizing with phosphatic and potassic manures, free from nitrogen—if the land is too rich therein. The main point, however, is to guard against too rapid growth by using too much water, or by allowing excessive moisture to escape by slacker cultivation. Early in the season fruit may be dropped by too rapid temperature changes, but not at this time of the year. The rust you speak of is not prevalent enough in your case to cause the trouble.

Gypsum Cannot Replace Drainage.

To the Editor: In February, 1913, I applied about 1500 pounds of gypsum to the acre to a very stiff adobe I have, planted to young vineyard. Last fall, before the rains, on another spot of the same soil I put on gypsum at the rate of two tons to the acre. I did this to take the "stickiness" out of the soil, as I read several articles about this in your Press. The land is very hard to plow and mean to handle, and after last winter's rainfall it was nearly impossible to do anything with it. I would like to know if it is really going to do it? I put the gypsum on a small piece only, but find absolutely no difference in the working of the land—just as sticky as ever and hard to work, even where I put the heavy application on. I intend (if it is going to do the work as claimed) to apply more gypsum for the balance of my adobe. I have about three acres in all. Now I hesitate to spend any money just for the sake of helping fertilizer companies unless I get my results, or does it take a generation or two before it will work, or is it a University theory? I intend to put the gypsum on in October and harrow or cultivate it in.—T. C. G., Concord.

To the Editor: "The land in question has some slope, but a year like last, when we had considerable rain, the water runs over it quite a lot and it gets pretty wet and the water stands. In the two dry years the ground worked pretty fair. I think myself the water question is the main trouble, although I thought by putting the gypsum on this would correct the trouble regardless of water. The land has a fall or one or two feet per hundred—not less. It is not a "hog waller" for drainage, and by plowing a furrow across, the water will run pretty good except when there is continuous heavy rain. Then it will spread out and stand for several weeks, which packs and makes the ground awful hard to plow when dry enough. The land above me, where some of the water comes from, extends only about one-fourth mile, from there it slopes the other way.—T. C. G., Concord, Cal.

The second letter was written in answer to ours, in which we guessed that the trouble was lack of drainage, and suggested that gypsum is of little avail where water seeps onto the land and stays there too long. Lime would not help the situation any more than gypsum, but it might pay to dig a deep ditch along the upper side of the place to carry away the seepage from above, and lay tile drains in lines rather close together to drain the wet fields. Then gypsum or lime, a ton per acre, would take out the "stickiness."—Editors.

TO THE Editor: If the Pacific Rural Press would organize its subscribers into one large social society, out of it would spring the greatest co-operative society any State could be proud of. We could have a day at the Panama-Pacific Exposition that would mean something, and your paper would double or treble its subscribers. Everyone would want to get in. We could appoint delegates to meet at each county seat and form our Pacific Rural Press Social Adjunct, and with your advice marketing would become effective.—L. D. T., Corcoran.

We are appreciative of the sincerity and cordiality of this suggestion and are thankful for it. Our conviction is, however, that such a basis of organization would be unfortunate in one way at least. It would throw us at once under suspicion of urging organization for our own sakes through extension of the business of this journal and no lasting and effective organization could thrive under imputation of such a motive, nor would this journal be made permanently prosperous if it should appear that we were selfishly scheming in that way. In a small way it would be "stealing the livery of heaven to serve the devil in"—we consenting, in this case, to be the devil simply to complete the figure.

Rural Press readers are already organized. They have weekly opportunity to express their sentiments and beliefs and to receive ours. Their work should not be to form a close corporation of members to possess the truth for their own advantage, even though they multiplied tenfold by such effort. They and we owe a duty to the State and to all the people. Our Rural readers should go forward into leadership of local effort for organization in every community. We shall be glad if they light their torches at our altar and forge forth to wake all who are now sleeping. We are glad to lead but not to try to encompass what belongs to the people.

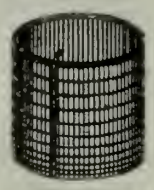
How to Stop Dried Fruit Speculation.

[Written for Pacific Rural Press by G. E. Merrill, San Jose.]

How much longer are dried fruit producers to endure the evils of speculation in dried apricots, prunes, and peaches? Marketing conditions in the dried fruit business this year are largely due to past and present speculation, which is but another term for gambling. In any gambling game a few individuals prosper at the expense of many. The few who prosper are likely to be the more aggressive ones of those who participate in the game and because of their aggressiveness claim and receive more consideration than they are in justice entitled to. Naturally the successful aggressive gamblers in the dried fruit game are in favor of continuing the present system, even though it be harmful to the interests of the majority interested. It is the influence of these successful men, and they are not all packers and middlemen, that prevents the proper co-ordination of the interests of the various classes concerned in the production and distribution of California dried fruits.

Although producers, middlemen, and consumers, all at times feel the evil effects of speculation, it is the producer who most frequently and severely suffers. That the middleman is sometimes pinched by an unlooked for turn in the market is a statement with which some of the more militant proponents of the movement to shorten the road from producer to consumer may not agree. And yet, only last year a large part of the prune crop was bought by bull operators on a 5-6 cent basis before they had sold much fruit. Later, growers who had not sold became stampeded and let their prunes go for 4½ cents or less. In what position, then, was a packer who had acquired his full capacity on a higher basis? This year conditions may be reversed and the grower may be the one who pays the price of speculation. In fact, to a grower the present market situation bears all the earmarks of competition among the packers to sell to their customers and of co-operation in buying from the grower. If these are indeed the conditions the lot of the grower is not an enviable one.

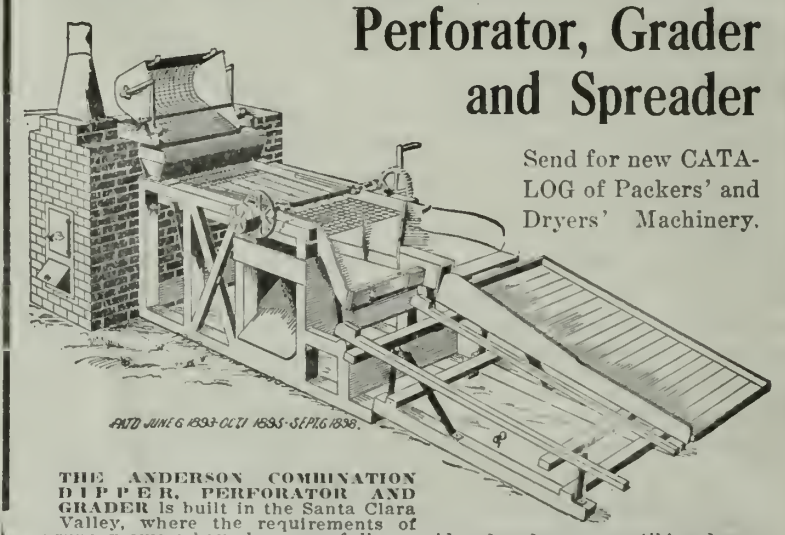
There is a certain element of justice in the fact that the evils of speculation fall most heavily on the producer as he is, perhaps, the most to blame for it. Through effective organization the dried fruit growers have it in their power to place the dried fruit market on such a basis that they and not the middlemen would have the dominant voice in saying what the price of the wares they produce should be. We are aware that attempts have been made and are now being made to bring about this organization. In the past as at present the difficulty of financing these movements has been the greatest obstacle to their success. That this difficulty is unnecessary and that it can be eliminated is the opinion of J. H. Bone, a well-known fruit grower of the Santa Clara Valley. Mr. Bone believes that ample capital has already been put into the fruit packing business and that workers for co-operation ought to strive to bring about a mutual understanding between packers and growers rather than to induce growers to finance new projects of their own. In short, the best kind of co-operation would not destroy the capital already invested by the packers, but would insure to it a just return. An effective, aggressive organization representative of all interests concerned in the dried fruit business would consider the welfare of the business as a whole, and would look to the exploitation of new markets in the future as well as to the proper development of the industry within the state.



Mr. Bone points out that to cure many of the present marketing evils an organization of a majority of growers to agree each year simply to hold their fruit under any circumstances until the market and crop conditions had been thoroughly surveyed and studied would be sufficient. To illustrate: If 75 per cent of the prune growers of California would agree not to sell any prunes until the first of July or later, would any packer dare to sell short at a figure unremunerative to the grower? On July 1, say, for prunes, and at an earlier date for apricots, a committee of growers who were thoroughly familiar with crop and other conditions might meet representatives of the packers and there agree on a minimum price that would be equitable to all concerned.

A growers' organization of the sort outlined in the foregoing need cost but little, a few cents per acre, perhaps. Its power for good would be felt immediately, and ultimately it would exercise a controlling influence in the dried fruit market. Best of all, such an organization would not antagonize the various other co-operative influences that are now at work, each one of which would, of course, be represented at the conference at which equitable prices were agreed on. Through the efforts of the organization, growers who are financially weak could be given credit until the proper time for selling had arrived. Thus one of the principal sources of strength of the short selling bear operator would be eliminated. The time is past for the most effective organization for the disposal of the crops of this year, but prompt action even now might do much to help. At any rate no opportunity must be lost to agitate this matter thoroughly and at least to attempt to have an effective organization in the field before another year rolls around with market conditions even worse perhaps than those of this season.

George E. Merrill.



On July 15, the first carload shipments of melons left Turlock.

Test for Sugar in Grapes.

To the Editor: A law was recently passed by the California legislature requiring table grapes to test 17% sugar. In this little pioneer valley we have never had any experience in making a test of this kind and don't know how to go about it. We want to make the test now in order to find out whether we can meet the requirements.—W. C. C., Thermal.

[H. F. Ellis of the Cal. Fruit Exchange calls attention to the fact that the law specifies the use of "Balling's Test." A Balling saccharometer costs $2; a glass tube to hold the juice during the test costs about 50 cents. The saccharometer looks about like a big thermometer tube, and shows on its face the corrections that must be made for varying temperatures of the juice. E. M. Sheehan, secretary of the State Viticultural Commissioners, writes as follows:

"The standardization statute passed by the last Legislature will be in operation August 9, 1915. Testing is a simple process. Only a tube for the juice and a standardized float, or saccharometer are required. Let the grower gather a few average samples from his vineyard consisting of half a dozen bunches of grapes. Place them in a piece of cheesecloth or burlap and crush them, allowing the juice to filter through the cloth. Put the juice in a glass tube about 1½ inches in diameter and about 10 inches deep. It makes no difference about the size of the tube, except that the quantity of juice must be sufficient to float the saccharometer.

"A standardized saccharometer for grape may be obtained at any wholesale drugstore or chemist's establishment, and with it the sugar reading will be made almost instantly. To obtain an absolutely correct reading the juice should be of the temperature of 60° Fahrenheit. The stem of the saccharometer will then show the correct sugar reading at the line where the surface of the liquid rests against the stem of the gauge. The operation need not require five minutes."]

CROP INFORMATION ESSENTIAL.

To the Editor: While reading your and other farmers' journals I often wonder what we would do without the papers which we get delivered at our doors. There is much to learn from this kind of reading, yet it is strange to me why we find sometimes statements which are far from the truth and working a hardship on the farmer. Farming, as we know by experience, is not a very profitable business nowadays. Hay (alfalfa and grain) is very low. Last year we sold our alfalfa in the winter and spring for $4.00 per ton. Figuring the cost of production at $3.00 there would be left $1.00 per ton to pay for taxes, interest, etc. This is not so every year; if it was the farms would be left without tenants. Would it not be right for the farmers' journals to let their readers know about the conditions of crops and about the future prices of the same? We all know that alfalfa is short this year. This is also true of oats and other kinds of hay. About thirty per cent of the alfalfa lands in Modesto and Turlock districts were plowed up. The first crop was spoiled by rain to the extent of about 40 per cent and the second and third crops are very light. The nights were too cold. In these two districts the alfalfa crop will be short at least 300,000 tons. Nearly all dairies will be short on feed. This is also the case in the Sacramento valley, yet the newspapers keep writing about big crops, which will keep the prices down and will bankrupt a good many farmers.

The prices will of course be a good deal higher later in the season, but how will that benefit the farmers who have to meet their bills at present. The dairy business is the most profitable, although it is not as good as before. Even with the importation of butter from Australia stopped the prices are low, and if everybody should feed their alfalfa to cows the result would be very low prices for butter and cattle. In my opinion it is the best to have this divided, but I believe the papers could help the farmers a little by not helping the exporters or merchants by misstatements of crops, but by telling the truth about it.—A Subscriber, Modesto.

[Our correspondent presents a real and fundamental need of farming—a thing essential to widely intelligent and profitable production of crops. This journal, and our contemporaries of the better class also, are always alert to state facts about crop prospects and crop conditions. For our own sake we can say that we have neither inclination nor interest in stating facts about crops and prices otherwise than as they actually are. But it is not within the power of this or any other journal to secure the facts as completely and promptly as they should be had to possess the value which they should present. The outlay required to collect and collate these facts is beyond the resources of any journal. They do what they can under the circumstances. It is properly a government duty because it is for the benefit of all the people—except a few who live by getting the start of others. The U. S. government crop reports are creditable from a national point of view, but for local uses each state should make its own reports and secure publicity for them by the co-operation of all local farm journals. Just now there is a new ray of hope for such things. The new "State Commission Market" law has machinery for it. We must wait and see how it will work.—Editors.]

CAREFULLY PICKED ELBERTAS.

[Written for Pacific Rural Press.]

Whether Elberta peaches shipped fast will bring a profit will depend largely on the care with which they are picked and on their size.

W. A. Harter of Modesto picks five or six times in order to get them in just the right condition for shipping. They must be almost entirely green, but must be laid easy in the buckets to prevent bruising even though they are hard.

He doesn't like to ship East because one must lose a third of the weight by picking them so green. He says they grow one-third large in the two or three days just before they start to turn yellow.

For shipment to California points he picks them when they have a light cream undercolor all over. Though if they are half green on the under side they can go along because they would ripen too much before the next picking. If Elberta are red and still have a green under color, for local markets one must wait until they have a yellow ground color over at least half of the peach.

Mr. Harter has arrangements with the shippers to furnish the shook and send packers out to the ranch, thus avoiding the jar and bruising caused by hauling unpacked peaches over the roads. The culls which the packers throw out are cut for drying, but this on the large orchard of Mr. Harter is not very much because the pickers are careful.

WOMAN GROWS BEST APPLES.

[Written for Pacific Rural Press.]

It takes a woman to grow Gravenstein apples, according to Mrs. Ida Hunt of Sonoma county, because a woman is not so impatient of details.

Before the first ones ripen, Mrs. Hunt cultivates her ground fine so that no clods are left for the fruit to fall on and bruise. She picks the fruit up every morning so that other fruit will not fall onto it, and so it will not sunburn. This dropped fruit is all cleaned off with a cloth and sold as No. 2 grade; if it is bruised noticeably, it is dried. She picks the apples for the first grade sometimes as often as every 10 days.

Mrs. Hunt will be remembered as the winner of sweepstakes prizes at recent apple shows. A ten-box entry made by her scored 999 out of a possible 1000 points. Commercially, her apples demand a premium for foreign shipment. Last July she had an order for 500 boxes to go to Alaska at $1.75 f. o. b. Attention to details has paid.

SULPHUR

Fleur de Soufre, Anchor Brand, Velvet Flowers of Sulphur and Eagle Brand. Packed in barrels and double sacks. Are the fluffiest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes. LEAVING NO ASH. SEND FOR ILLUSTRATED BOOKLET; also PRICE LIST and SAMPLES.

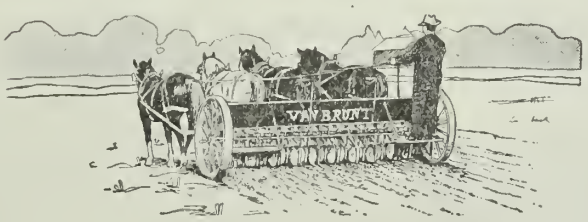
John Deere Implements

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed — the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.



Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.

Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".

Van Brunt Single Disc Grain Drills

Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X - 152.

JOHN DEERE MOLINE, ILL.
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

John Deere Publicity Department, Moline, Illinois

Grading and Packing Lemons.

[Written for Pacific Rural Press.]

Down in Orange county we asked a lemon packer how the markets were. "Very bum," said he. We did not wonder when we saw the way his men dumped the lemons from the grader into sacks and then into boxes and handled them without gloves or care. He admitted considerable loss from blue mold and laid it to the rainy weather. We thought of the good reputation in the Eastern markets of the San Dimas Lemon Association and of the care they use in putting up seven or eight hundred cars per year, the product of about 300 grower-members.

When they are ready to ship a car, after the fruit has been cured, it is sent up from the curing room to the packing room by an elevator and carried directly to cotton-gloved men and women, who grade the fruit for texture and quality, and lay it on 2x3 trays, 3½ inches deep, so they can be stacked up without danger of injury to the lemons.

In grading the fruit, they take out all the rots and record the exact number from each lot belonging to each grower caused by each different kind of trouble. These records are made on a "grading bench record" card, which also shows the grower's number, the lot number, the number of boxes, and the weight of the culls, the number of trays, and the weight of each of the three qualities of tree ripe fruit. The total weights of all these grades and the culls are added together as a check on the weights made for that grower's fruit when it was washed.

The various grades of lemons packed by the San Dimas Association are labeled so that when a customer finds what he wants he will call for that brand again. The Pet brand is its fanciest product; the Greyhound next; the Duck is third; and the Arab and Pup are the "tree ripe" brands.

Handle Like Eggs.—A lemon dropped to the floor is never packed; an uninjured lemon with whiskers of mold on the outside and no apparent injury is washed off with a moist sponge, but if sooted for lack of washing, after black scale has encouraged soot fungus, it is sent back to the washing room. There are only a few culls on account of the care previously exercised in picking and curing, and as mentioned elsewhere there is only about one-fourth of one per cent decay.

The proportion of first grades and lower depends on the care of the orchard. For instance, if the trees have not had enough irrigation, there is a larger percentage of lower grades. As the lemons are graded, they are picked up and laid down in the trays like eggs, in one layer. The trays hold about one-third of a packed box and have tray paper in the bottom to prevent bruising and getting dirty.

Packing.—Stacks of the trays are carted to the packers, of whom there are about as many as there are graders. There were eighteen one day last February when they had not expected to work, but had gotten an order for a car. There are 48 packers sometimes, and the minimum working force is 12 packers when the outfit is least busy in August, September and October. The packer watches the tray and selects first those that will grade 300 per box. Each lemon is wrapped in a printed label and all are packed tightly in two-compartment boxes 10⅜x13½x25 inches net. When all of the 300's have been picked out, she calls "tray back," and a man pulls it out of the way. When all of the 300's have been picked out, she goes through the stack of trays again for the 360's; then for the Jumbo's, which pack 270 per box; then for the 442's, which are the last packed.

An average nine-hour day's work is about 38 boxes of all sizes, but each packer must put her own number on each box so that any slipshod work may be traced if such should escape the eye of the foreman. Packers are paid by a sliding scale from $2 for 30 boxes up to $2.70 for 40 boxes, if they are packed in first-class shape.

VINEYARD SOIL CRACKING.

To the Editor: Would you advise irirgating Thompson seedless grapes now, as they have not been irrigated this season? The ground is getting very dry, and I am afraid the grapes will be small. The soil, which is heavy black, is cracking open.—W. W. D., Arboga.

[The cracking of your soil indicates its dryness on top, which must be due to lack of proper cultivation on such heavy soil. It may be necessary to give it a light irrigation in order to soften the dirt enough to cultvate not very deeply but well. Before giving it a heavy irrigation, use a soil auger and find out how deeply it is dried. If you find moist earth within a foot of the surface, no further irrigation will be necessary until the fruit is off.—Editors]

A red seal with a rosy red apple and the word "standard" on it will be placed on every box of apples meeting the requirements of the new standardization law after Aug. 7. These stamps will be sold to packers for a half cent each, and the money obtained will be used to enforce the provisions of the standardization act.

Kill Morning Glory

NOXIOUS WEEDS
AND INJURIOUS INSECTS

Use NONPAREIL

Used and recommended by the largest berry-growers in the State and many of the horticultural commissioners. The growing season is the time to apply NONPAREIL. Send for booklet P, which gives full particulars and prices. Very low rates in drums and tank cars.

if you raise Almonds read this

a straight from the shoulder talk with proof to back it up.

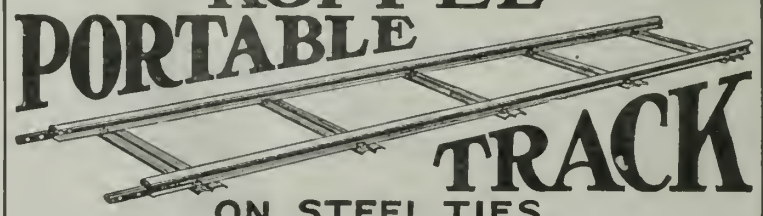
HOW to get the most profits out of his business is a question that interests every orchardist. And if he is really in earnest and wants to be able to enjoy the good things of life, he will investigate and learn how he can make the most money with the least effort in the quickest time and at the least cost.

That is just what we want to prove to you, Mr. Almond Grower, and without one cent of cost or the least obligation.

We want to send you free of charge, illustrated and descriptive literature about

The Read "Sure Pop" Almond Huller

When you have it you can prove by facts and figures, by your own reasoning powers and by letters from other orchardists who have used it, how this wonderful money, time and work saver can make bigger profits for you.



This literature is not lengthy, bulky, nor does it make "dry" reading. It is full of practical common sense and explains clearly and briefly just why the Read "Sure Pop" Almond Huller should be owned by every almond orchardist. If you send for it now you will soon solve the "how" of making more profits from almond raising.

Write now while you think of it. Address

Growers Require Money on Delivery.

(Continued from page 73.)

price named by the Exchange. Even better arrangements have been made for 1915.

"In regard to loans on growing crops, we are operating without invested capital save that which is necessary for the operation of the business; consequently have not the funds available for future loans. Heretofore the Exchange has been able to arrange loans on growing crops direct from a State bank to the grower where the grower was unquestionably worthy and financially responsible for such loans. This loan was made on the basis of the grower's crop, but more largely on the basis of the grower's responsibility itself.

"However, the following plan is now in operation with most of the affiliated Associations of the Exchange with regard to growing crops. A number of our Associations have been able to make arrangements with their local banks whereby the bank loans the grower a sum of money with the understanding that the Exchange is to withhold this amount from the first proceeds of the sale, less selling and handling costs. A committee is appointed by the local association directors as a loan committee, who are residents of the district in which the Association is located, and who personally inspect the crops of the growers and make recommendations accordingly. In this manner the Exchange is no longer bothered with the question of future loans—this item being one of the missions of the local association. So far, with the exception of $33.42 which is still outstanding, every dollar that was loaned on future crops during the past five years has been promptly repaid.

Borrow Only for Advances.—"We believe that the Exchange today enjoys the best financial credit ever extended to a purely co-operative association, proving that as the growers evidence a real desire to cooperate along business lines they will have no trouble in financing their legitimate enterprises. We have proved to the bank time and time again that the California Almond Growers' Exchange is the safest account they have and they now realize this fact. The Exchange does not buy a single article for sale and hence there is no loss from speculation, and the money that is borrowed is used exclusively for advances to growers on crops when delivered.

"There are only two chances of loss to a bank through a loan of this kind. First: dishonest management, and second: market decline. A sufficient bond and careful attention on the part of Directors to details of business will obviate the first, and a reasonable margin of safety on the loans makes the latter element of loss practically impossible.

"It might be interesting to you to know that the Exchange in five years of operation, handling millions of dollars of business, has yet the first dollar to wipe off its books on account of bad sales.

"We do not have any stated amount or percentage to growers on delivery, as this depends upon the quantity of the crop to be marketed and percentage of it that is sold, and every other element entering into ordinary commercial intercourse. We aim to pay our growers as much as we safely can, anticipating a reasonable return of this money from sales. Ordinarily at least 50 per cent is paid on delivery. We treat every grower, large and small, alike in the matter of advances. No partiality is shown to any one or to any district.

"The reason for the satisfactory credit enjoyed by the Exchange is that the Exchange aims to borrow only such money that it can pay within a reasonable time, although we have at various times found it convenient to borrow on goods unsold not knowing when they would be sold, in which case the lender so understood, and the outcome has always been entirely satisfactory."

Big Credit to Perishable-Fruit Growers.—Concerning the ability of co-operative associations to borrow from banks for the marketing of even perishable fruit, G. H. Powell says of the California Fruit Growers' Exchange:

"It has no assets except a paid-in capital of $1,700, office fixtures, and supplies, although it handles $16,000,000 to $20,000,000 worth of fruit annually, or about 65 per cent of the citrus-fruit crop of California, and is able to secure the necessary credit, the bankers of California realizing that the co-operative movement is the foundation stone on which the $200,000,000 invested in the citrus industry rests. In other words, this is a rural credit system of the soundest type, the federated moral security of 7,000 growers and a history of careful management being its only collateral."

The California Fruit Exchange, the co-operative marketing organization for deciduous fruit growers shipping fresh fruit, finances itself and its individual growers from a reserve fund built up by setting aside 15 per cent of its net earnings annually for this purpose.

ASPHALTS DECAYED TREES.

[Written for Pacific Rural Press.]

In doctoring holes in orchard trees, many people use cement as a filler, but this appeared too heavy to suit H. R. Dakin of Alameda county, especially where injuries and rotting had occurred on outlying branches, or on stubs of limbs where grafts on one side only had grown, leaving a deadened section down the other side.

His Farm Adviser suggested the use of sawdust mixed with hot asphaltum. As much fine dry redwood sawdust as possible was mixed with hot asphaltum and packed into the holes after cleaning them out and disinfecting with thin creosote paint. It was pounded in with a hammer, and made "nearly as hard as cement and light as a feather."

It was necessary in some cases in the following summer when the hot weather had softened the mixture to pack it in tighter. It was expected that after one or two re-packings it would be so tight that no rain or fungus spores could get in, and shortly the tree would grow over it.

The advantages over cement are that in case the waving of the tree, the weight of nuts and fruit, or other causes should loosen the wood from the asphalt mixture, it could be pounded in to fit, while cement would be entirely rigid. Cement seems all right for trunks and even big limbs.

CHERRIES IN CARTONS.

[Written for Pacific Rural Press.]

Three stacks of cherries in boxes were standing side by side on the San Francisco market the other day. In one of them were small, black cherries loose. These were selling at 5 cents a pound. In another were Royal Anne cherries faced about 8 or 9 rows across the box. These were selling at $1.00 per box of 9 pounds net. Another was packed in 8 cartons per box of the same size as the faced box and these were selling at $1.30.

The cherries in the three stacks were scarcely of the same quality and the cheaper ones were the smallest, while those in the faced box were smaller and less uniformly colored than those in the cartons, yet the 30 cents extra obtained for the cherries in the cartons seemed pretty good pay for the cartons, the quality, and the little extra labor of packing, especially since there is considerable reduction in the amount of fruit packed in a box that way.

When you think of ROOFING

Whether it be for your new House, Barn, or Chicken Coop

INSIST ON Pioneer Roofing

It is the one roofing that you can absolutely rely upon under all weather conditions. It wears longer, looks better, and costs less than others. Pioneer Roofing is made in grades and weights to suit every type of building—for new and old roofs; bungalows, barns, garages, factories, etc.

WET-WEATHER ROOF REPAIRING.

[Written for Pacific Rural Press.]

If it costs $100 an acre to bring prune trees into bearing, or if the crop from mature trees would sell for $100 an acre, it takes almost as much work on that orchard whether it bears a good crop or whether it fails for lack of water.

There are many sections in the State where irrigation from streams is impracticable, but where the pump has proved its value in ordinary seasons and is indispensable in dry seasons. But a well and pump often cannot be installed after they are needed and before much damage is done to crops.

We visited a section last summer in which the fruit looked unutterably dry and discouraged. We visited the same section this summer and inquired if any more pumps had been installed and the reply was that this season and last one had brought so much rainfall that pumps did not seem very much needed so practically none had been installed during the past year. Remembering the large number of orchardists who had to abandon young orchards or who failed because their older orchards did not bear during the two dry years not so long past, we compared them in our mind with the Arkansan who did not repair his roof when it was raining because he was already wet.

CENTRIFUGAL ALWAYS PRIMED.

[Written for Pacific Rural Press.]

J. E. Kirker of Tulare county got doused last April because he had a better pump than he knew. He wanted to show a neighbor the new improvement by which his centrifugal pump continually remained primed.

The pump was installed about a year ago, but had not been used since last fall. Mr. Kirker took the neighbor down to the pump and took off the lid by which access is gained to a check valve located in the elbow just below the pump. This check valve lying horizontally on its leather circle on top of the suction pipe prevents the water running back into the well and keeps the pump full and ready to start operations.

After standing unused all winter, when Mr. Kirker took the lid off, the water squirted all over him and afforded ample demonstration that the valve was doing the work it was intended for.

The only way of starting many centrifugal pumps is to use a common little Douglas pump with which to pump it full of water. In some centrifugals, a valve is placed in the bottom of the suction pipe, but when gravel gets into the valve or when the leather wears out, the whole 30 feet of pipe must be pulled up in order to repair the trouble. In Mr. Kirker's pump the valve is most conveniently accessible.

UNIFORM IRRIGATION MEASUREMENT NEEDED.

To the Editor: The impression that practically all irrigation water is paid for by the inch seems to be quite general, and being erroneous the writer takes the liberty of stating the facts.

In Southern California the rule is to measure the water and charge by the inch, but even there the method of measuring and price are not uniform. Some charge a price per acre per year, allowing a given number of acres to the inch. Others charge by the hour, or by the day for a flow measured in inches. Some charge by the number of cubic feet of water delivered in a given time while still others charge by the gallon.

In Imperial Valley, the California Development Company charges by the acre-foot and delivers more than 5000 acre-feet a day.

In San Joaquin Valley, where more water is used for irrigation than all the rest of the State, the charge is made by the acre for all the water the irrigator wants, and he usually wants more than is good for his land.

In the foothills of the Sierras, where the irrigation is done from ditches, which formerly were mining ditches, the charge is generally by the inch for hourly or daily run.

Not only does the price per inch vary,—and the duration of run,—but the quantity representing the "inch" is different in different localities.

The Civil Code says an appropriator must specify in his notice of appropriation the quantity of water he claims "in inches measured under a four-inch pressure." So measured, an inch of water is 0.02 cubic feet per second, 1.2 cubic feet per minute, or 9 gallons a minute, re-

A Better Make Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

quiring fifty inches to make one cubic foot a second.

A statute enacted in 1903 declares that "The standard miner's inch of water shall be equivalent to one and one-half cubic foot of water per minute, measured through any aperture or orifice."

1.50 cubic ft. per minute equals 0.025 cu. ft. per second, equals 1-40 cubic ft per second, equals 11.25 gallons a minute.

Section 23 of the Act creating the Water Commission (Statutes 1913, Chapter 586) recites that "for the purposes of this act forty miner's inches shall be equivalent to one cubic foot per second." This corresponds with the definition made by the Statute of 1903.

While the sale of water is by the inch in the south and in the hill region of the northern part of the State, by different standards, by far the greater amount of water used in irrigation is delivered without measurement.

P. M. Narbor, Asst. State Engineer.

MORE TRACTOR POINTERS.

[Written for Pacific Rural Press.]

Where a small gear wheel is used in a tractor to exert considerable driving force, there are fewer teeth in contact at any one time than where a larger gear or sprocket wheel is used. With the greater load per sprocket or cog, there is greater wear both on the sleeves and on the gear. The larger gear wheel wastes more of its power by applying it at a greater distance from the axle, but it may be that the power consumed is offset by the greater wear on the gears.

In this connection, it is interesting to note the remark of G. S. Wheeler of Stanislaus county when he says: "I would not advise the purchase of a poorly made machine as they will not stand up under all conditions. Better get a machine on which the repair bills will not eat up the profit." Any machine will need repairs more or less, so Mr. Wheeler advises buying a local make so that repairs will be available. Round wheel types have an advantage over the track types in repairs required, although a track-type man will say that you had better put $150 a year more into repairs than to lose urgently needed time on soft ground.

W. G. Wilde of Ventura county advises tractor operators that the slower the motor runs the better; do not overload the tractor. He says, "I use my tractor for plowing, harrowing, clod mashing, cycloning, chiseling, and all work on the ranch except planting, cultivating, and cutting. The greatest usefulness of the wheel type is on very heavy soil." Mr. Wheeler likes the type "that will make a turn in the least space."

BAMBOO POLES FOR ALMONDS.

[Written for Pacific Rural Press.]

Bamboo poles are used in harvesting almonds by P. D. Bane of Glenn county instead of the cured willows which many people in his section use. Bamboo does not splinter, nor does it hurt the trees.

He doesn't take two trees at a setting like Mr. Goodwin of Ripon does; because the varieties are set in alternate rows, and he picks each variety and hulls separately. This is because if all the varieties are mixed, he gets less for the whole crop. The almond jobbers want the varieties separate, though probably the consumers never know the difference.

From the field the almonds are taken to the huller and then the cleaned nuts are laid out in trays in a field to dry so that none partake of the sulphur fumes which are used in bleaching the shells. They are dried enough when they rattle and when the kernel will not bend without breaking. When the kernel is dried enough it will not get rancid from the sulphur.

Two objects are attained by sulphuring, which Mr. Bane does on his own place. No worms survive, and the shells are whitened as is much demanded by the trade.

The size of parcels post packages has been increased to a combined length and girth of 84 inches, which will permit the mailing of fruit and berry crates. A receipt system similar to the one in use by express companies has also been established.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

A 60 per cent navel crop is now reported to be expected at Lindsay, as a result of about three days of heavy falling.

It is feared that Visalia will not be able to hold the Citrus Fair in December, as anticipated, as the new pavilion being erected for fair purposes may not be completed in time.

Los Angeles leads the other counties of the State in the production of lemons, with Ventura county second. San Bernardino county is first in orange production, and Los Angeles ranks second.

A packing plant for handling citrus products is shortly to be built in Lindsay by the Foothill Packing Company. It is to be modern in every respect, and will have a capacity capable of handling ten carloads per day.

Tulare county citrus growers recently met at Porterville and were addressed by Prof. W. M. Mertz of the Riverside Experiment Station on the subject of "Cover Crops in Relation to Orchard Management." A lecture on "Fumigation" was also delivered by Prof. de Ong of the Experiment Station.

A bulletin on how to distinguish date varieties has been published by C. S. Mason of the U. S. Dept. Agr., concerning which Paul Popenoe mentions the following pointers: Measurements of different parts of the leaf furnish a guide for identifying several varieties even when they are not in fruit. They seem also to indicate what kind of fruit a palm will bear before it has come into bearing. By using pollen from a male palm, whose measurements are nearly as possible the same as those of the female palm, the seedlings seem likely to come nearer true than if the pollen were taken at random.

GRAPES AND SMALL FRUIT.

It is reported that California seeded raisins are now being shipped to Europe for the first time.

Three thousand five hundred tons of raisins are being stemmed by the California Associated Raisin Company at their Reedley plant.

It is reported that the largest winery in Central California has annulled all wine grape contracts, freeing 40,000 tons of grapes.

The Farmers of the Lockeford center of the San Joaquin County Farm Bureau recently listened to a lecture by Farm Adviser Lyons on grape diseases, their prevention, and cure.

It is expected by packers that the first run of Thompson seedless grapes will commence between July 25 and 28, a very small quantity being expected to be shipped as green fruit, as good prices are anticipated for raisins.

The product of Malagas from the 100-acre vineyard of the Great Western Vineyard Company will be packed this year instead of being made into wine, as previously. The company plans also to dry a large quantity of the Thompson seedless grapes, which have been in the past used for blending.

The California Associated Raisin Company has decided to branch out in the dried fruit business, in order to further the sale of raisins; as it is stated that in many cases jobbers do not care to purchase an entire car of raisins, but would be willing to take a half a car and the other half in dried fruits.

Wylie M. Giffen, president of the California Associated Raisin Company, returned from the East recently where he had been to look over the market situation and to get the representatives of the company in line for a big selling campaign this fall. While it is too early to estimate the grape crop, Mr. Giffen believes that, given the usual growing and harvesting conditions, California will produce a large crop of raisins this fall—possibly going as high as 105,000 tons, as against 95,000 tons last year. He thinks that the hold-over crop, amounting at this time to 25,000 tons, will be all sold by the time the new crop is ready to market, and, therefore, believes that the 1915 crop will command fair prices and ready sales. The big advertising campaign conducted by the Associated the past season, he says, was successful. If all of the raisins produced in the State were given the Associated to market, the work of the big co-operative company would be simplified, and all the growers would receive better returns.

OLIVES AND NUTS.

Butte county leads the State in the production of commercial olives and almonds. Contra Costa county takes second place in almonds, and Riverside and Tehama counties rank second in the percentage of olives grown.

A report from Spain to the California Almond Growers' Exchange states: "Jordans.—These started very well after fall of the blossoms, but adverse weather conditions have somewhat curtailed the yield. As there was abundant rain during the spring, it is hoped as a set-off to this curtailment that there will be a larger proportion of large-sized nuts than usual."

It is anticipated that the shipments of almonds from Oakdale this season will break all records. The local branch of the California Almond Growers' Exchange is reported to be flourishing, 23 new members recently being added at the annual meeting. The following officers were elected: C. C. Turner, president; and A. E. Schadlich, secretary and representative to the State exchange.

DECIDUOUS FRUITS.

Tomato canning at the Manteca Cannery will commence on August 15.

The new model cannery to be operated at Kingsburg by co-operative interests will open on July 20.

A new fruit, resembling both the apricot and the green gage plum, has been originated by J. W. Robinson of the Sebastopol Cash Nursery. He will call it the "Royal."

The Porterville plant of the Tulare County Growers' Association expects to have its entire stock of hold-over peaches sold before the canning of the new crop commences on July 26.

A report is given out that the Hanford branch of the California Fruit

New York Belting & Packing Co.,
San Francisco, Calif.

Gentlemen:- "Attention Mr. Gregory"

Your last shipment of Test Special belting came duly to hand. Please accept our thanks for promptness in filling this order.

We are now using this brand of belting on a good part of our plant and have found it so satisfactory that we are replacing all worn out belts with "Test Special." We have placed this belt on high speed machines and in places where severe strains and overloads are carried and our experience is that it carries the loads and lasts longer than the best grades of leather or Balata belting.

We find that it is not affected by heat or moisture, will not tear out at the lacing and will last twice as long on a run that wears out the best grade of leather belt. We do not hesitate to recommend "Test Special" belting for use for any purpose for which a belt is used.

Very truly yours,
Petaluma Box Co.

KIRKMAN NURSERIES
WHOLESALE GROWERS OF
True to Name Nursery Stock
Main Office: 2523 TULARE STREET, FRESNO, CALIF.

Canners' Association will not run this year for peach canning, but that fruit already purchased under contract will be sent north for canning.

A co-operative association for the canning and marketing of Tulare county fruit is rumored.

The American Pomological Society will meet in Berkeley on Sept. 1, 2, and 3 instead of on Aug. 23 to 25, as first announced.

An association for the purpose of constructing a co-operative cannery is under discussion by the fruit growers of Sutter county, as a result of the attitude of the canneries this year in refusing to buy peaches.

That the California Associated Raisin Company now controls the world-wide market, as a result of the European war, is the statement made by Jas. Madison, vice-president. The only other raisins available for human consumption are the Zante currants of Greece.

The plant of the California Fruit Canners' Association at Marysville will not run this season, depriving more than 500 people of work, according to an announcement made by the manager. It is also rumored that the company's cannery will not open at Yuba City either, on account of the condition of the fruit market this season.

On July 19 an examination was held at Fresno to select inspectors to enforce the new fruit standardization law which goes into effect next month. The examination was conducted by the State Horticultural Commissioner, Fred P. Roullard, County Horticultural Commissioner, and a representative of the growers.

GRAIN AND FIELD CROPS.

It is said that the Nevada wheat crop is larger this year than it has been for the past ten.

Atwater shipped the first sweet potatoes this season to San Francisco on July 12.

The San Joaquin Valley Sugar Company at Visalia shipped the first carload of 1915 sugar on July 10.

The first watermelons from Fresno county are now to be found on the markets in the various parts of the State.

Hay to the amount of 4200 tons arrived in San Francisco during the week ending July 17, which is an increase of over 1000 tons from last week's arrivals, the main part being old crop hay.

The Gridley Rice Milling Company has sacked and milled between fifty and sixty thousand sacks of rice during its run of six months, and it is expected that about 10,000 more will be received within two weeks' time. Porto Rico has been the destination of most of the finished product.

The Southern Pacific Company has submitted the following change in freight rates to the Interstate Commerce Commission for approval. Forty cents per 100 pounds on wheat, oats, and rice in sacks shipped in carload lots of 80,000 pounds; and fifty cents per 100 pounds for alfalfa meal in sacks shipped in carloads of 60,000 pounds from California points to the East.

MISCELLANEOUS.

The Merced district fair will be held September 23, 24, and 25.

The University of California will open its 53rd regular session on August 17.

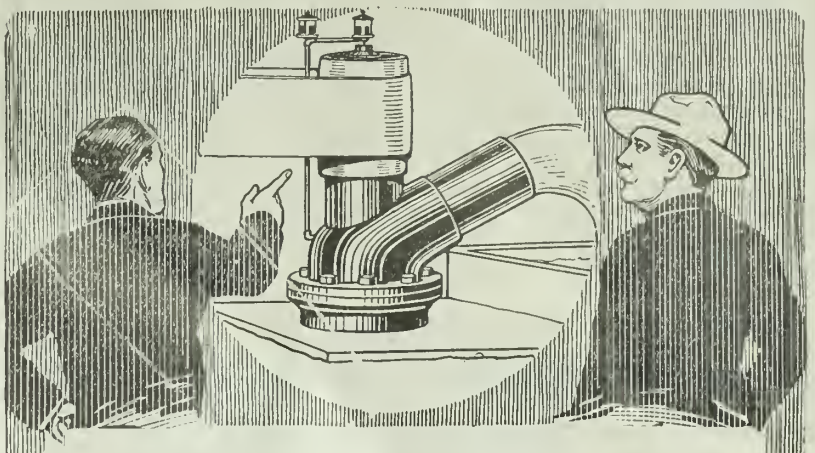
A dry farming station is to be established by the University of California at Coalinga.

August 14 will be San Joaquin Valley Day at the Exposition instead of July 31, as first announced.

Practically all of the fruit raised in California is produced in sixteen of its counties, Santa Clara ranking first.

Farm life improvement will be the feature of the 20th annual meeting of the American Association of Farmers' Institute Workers to be held Aug. 12 to 14 in Agricultural Hall at Berkeley.

A conference on fruit pests and weed pests found in the rice fields was recently held in Marysville by members of the State Commission of Horticulture and County Horticultural Commissioner Harney of Yuba.



A co-operative marketing agency of market gardeners and small fruit producers, in order to secure a regular market for the produce of residents of the suburban districts, is under consideration for Porterville, a meeting of the growers having been called for that purpose.

An interesting summer school session was held in Puyallup, Wash. from July 12 to 17. It was known as the Superintendents' Week of the Puyallup Summer Session, at which were given instructions on the many new subjects recently added to the educational system, and on which few school superintendents received training in their own school days.

In recognition of the exceptional value of the Oakland Produce Market to the growers along the Oakland, Antioch & Eastern Railway electric line, a fast express freight train to be called the "Produce Cannonball" will be run every week day commencing Monday, July 19, leaving Sacramento 6 p. m. and arriving in Oakland at midnight so that the commission houses of Oakland can have the produce at their stores in time for the early market.

San Joaquin county has just put out a bulletin describing its farm products, livestock, and poultry industries, showing in a very detailed way how they are grown, their disadvantages, advantages, yield, cost of production, and markets. The authorities on each statement regarding each product are cited, and practically the whole bulletin is devoted to agricultural information, including how to grow the livestock and various crops. Contrary to the usual county bulletins, only a few pages are devoted to descriptions of the towns and to the manufacturing industries.

Before leaving home, the prospective student of the University Farm Short Course will know that on the afternoon of Nov. 2 he can practice under the direction of Prof. G. H. True the judging of dairy bulls; that on the afternoon of Oct. 21, Dr. F. M. Hayes will show him how to vaccinate hogs to prevent hog cholera; that on the afternoon of Oct. 18, Prof. A. V. Stubenrauch will discuss how neighbors may co-operate for fruit marketing; and that on the morning of Oct. 14, Prof. R. L. Adams will tell how to economize and eliminate waste on a poultry farm. There are to be courses in general agriculture, dairy manufactures, poultry husbandry, and in horticulture, including deciduous fruits, citrus and semi-tropical fruits, viticulture, and olives. The full 779 acres of the University Farm will be the classroom for these visiting farmers and their wives.

Note the absence of intricate and exposed mechanism. So extremely simple—so compact—nothing to get out of order. This nicety of construction is found only in the Layne & Bowler Pump. Write at once for Booklet No. 25. Exhibit at San Francisco Exposition.

AT THE rate European horse buyers are making purchases in California at the present time, we may expect a horse shortage for many years to come. If the war lasts another year, the condition may become acute, as our small farmers, who are ever on the increase, must have horse-flesh in ever-increasing numbers. The purebred prospects become more flattering every day to the breeder who will devote time and attention in breeding real quality into his stock. Much of the advantage Europe has had in her centuries of horse breeding endeavor have been overcome with one stroke; and the California farmer with his feed and natural climatic advantages has never been in a better position to place California on the map as a stud farm center, or to enter horse breeding on equal terms with breeders in all parts of the world.

Getting Money and Pleasure From Dairy.

Cow-Testing Records Show Cows' Pr oduction; Comparative Value of New Bulls, Rations, and Milking Machines; Monthly Prices of Fat; and Keep the Boys Interested.

[Written for Pacific Rural Press.]

Anyone who has the least doubt about the benefits to be derived from regularity in the testing and weighing of a dairy cow's milk should visit John Trigg of Humboldt county.

Six years ago Mr. Trigg joined the Ferndale Cow Testing Association to weed out his boarders. He has kept up his membership to check up each new practice as well as to know which are the best cows in his herd, for it is from the best ones that he must look for still further improvement in breeding.

If he tries out a new bull, he knows absolutely whether he is breeding correctly. If he tries a new ration, he knows whether it is better or worse than the previous one in dollars and cents. When he purchased four milking machines over a year ago, he used his association records to determine whether there was a falling off in milk or not, and when he commences to feed the silage from his new stave silo this year he will know whether it is beneficial from a feeding standpoint. By referring to his records, he knows what price has been paid for butterfat each month in the year, the average butterfat test of his herd, the exact amount of milk produced by each cow and by the herd, the total income per cow per day, month, or year. In fact, Mr. Trigg can refer to his cow testing records and give you an itemized account as complete as you would find in the most progressive business enterprise in the country.

All of this has meant greater financial returns. It has meant the establishing of a 350-pounds-of-fat standard in matured cows, which is rigidly adhered to. It has meant the interesting of his sons, two of which are now taking agricultural college dairy husbandry courses. As an example of their initiative and judgment, a Jersey bull calf was purchased this year to be later used as herd sire, solely upon the judgment of one of the sons. The silo built this spring was due largely to the advice secured by the sons, and so it goes. Each member of the family is interested in the dairy because there is always a game on at home. That game is played with cows, the picking of the winner each month or year being good fun. The winner is naturally the heaviest producer. There is a vague something which you can feel, but cannot explain, that makes you sure of a better and more interesting life on such a farm. You have a feeling that boys raised in this manner are not the ones who will be attracted by the city life, but will go ahead on the old farm and make it an even more prosperous establishment than father has.

To illustrate, one little Jersey in the herd is called Tootsie, and she is known by each member of the family quite intimately; not alone because she likes appreciation, but because she pays at the milk pail. That is the final measurement of every cow on this ranch.

As the following records show, Tootsie returned her owners an average of $138.80 per annum for the last three years since freshening, and is still only five years old. Each set of figures represents one full year's testing and will give the most skeptical some idea of what consistent testing is worth.

Tootsie's record is better than some of her stable mates, but the average return per cow last year was $114. Six heifers in the herd, which freshened last year, averaged over 250 pounds of fat with their first calves. Some day Mr. Trigg believes that he will have more Tootsies in his herd and that their annual production will be higher than at present. All but five of the cows in the herd are grade Jerseys, the others being registered. Some day the percentage of registered cows will be turned about.

In face of this evidence, we did not dare to ask the question we meant to: "Does testing pay?" Would you?

RIVERSIDE COW TESTING.

Many sections of Southern California which have not heretofore been considered dairy districts are developing along this line rapidly.

An example of the growth in Riverside county which has formerly been considered a fruit county pure and simple is shown by the organization of a cow testing association there 8 months ago.

We are informed by Mrs. E. Marion Bird of Riverside, who is Secretary of the Association, that there are 650 cows now being tested, belonging to 23 different dairymen. The charge per cow in this Association is $1.50 per year payable 6 months in advance.

The tester works on the guarantee of $75 per month for 900 cows or under and is to receive 8⅓ cents per cow per month for all over 900. This mode of payment encourages the tester to secure all new members possible, and it is through him and the work of members that the new members are secured.

Some difficulty has been found in holding the membership up to the required number.

Like dairymen in most other parts of the State at this time, testing is regarded more as a luxury than as a means of securing production at less expense, and for that reason the present low price of butter fat has tended to lower membership.

Practically all of those dairymen who are testing are using registered sires and approximately 20 per cent of the cows in the county are being tested by the association.

As has been the case with fruit growing in the southern part of the State, dairymen are showing a disposition to include progressive methods in their dairy work, as is shown by the large amount of purebred stock which has recently been sold there and the organization of this and two other cow testing associations in recent months. With Imperial county as their leader, we may expect great development along dairying lines in that part of the State in the future.

Wool growers in northern Sonoma county and southern Mendocino county report the best price in wool received in many years, long wool bringing 27½ cents and short wool, 25 cents.

Stockmen!

Do your Cattle, Hogs, Sheep, Horses respond satisfactorily to the feed you furnish them? That is, does your expenditure for feed bring satisfactory returns in the shape of milk, cream, butter fat, pork, mutton and horse power? Is your investment in feed profitable? Does it pay?

Productive Feeding of Farm Animals

By F. W. WOLL, Ph. D.

will, as its title indicates, tell you all about feeds and feeding. It gives tables and charts showing the exact food value of any feed or forage produced in California; with scientifically exact tables of what proportion of a certain feed each animal needs to produce the best results.

By all means, get a copy of this valuable work.

When Not to Vaccinate Hogs.

Simultaneous Method Dangerous Except in Skilled Hands; and Should Not Be Applied in Districts Not Yet Infected. Serum Alone for Pigs Under 50 Pounds.

When pigs get off feed or show any signs of sickness, the probability of cholera should be considered; as nine out of ten sick hogs have that disease, and recent investigations show that a heavy loss is annually experienced in California by farmers mistaking the disease for so-called cases of swine plague, infectious pneumonia, contagious sore eyes, staggers, and oftentimes paralysis.

Such is the contention set forth in a circular recently issued by the University of California, which while not pretending to furnish sufficient information to qualify the average hog owner to use either serum or virus, points out many timely warnings in an attempt to overcome the heavy financial loss occurring annually in this State from cholera.

Vaccination Not Always Practicable.—The circular advises all hog raisers to vaccinate their swine against hog cholera as soon as the danger of exposure is established, but owing to the expense of vaccination and the danger from carelessness in the use of virus, they recommend the immunization of hogs only in infected districts except in cases where purebred stock is to be shipped for exhibition or breeding purposes.

Two Methods.—There are two methods of immunizing hogs against cholera. In one, the serum alone is used, producing an immunity lasting thirty to ninety days; in the other, a small amount of virus (virulent hog-cholera-producing blood) is injected simultaneously with the serum, but at a different point in the body of the animal. The latter is known as the simultaneous method and will produce lasting immunity, except in suckling pigs and small shoats, in which case the immunity may disappear as they mature. Some serum manufacturers and others in their efforts to sell serum have advised all hog owners to immunize, stating that hog cholera is so prevalent that no farmer can afford to run the risk of keeping a susceptible herd. Under California conditions, general vaccination at present would be desirable only in infected districts, while in other localities it would be a needless expense. Use of the simultaneous method in non-infected districts by men poorly trained for the purpose may spread hog cholera, although we have seen no evidence that it has ever done so; while the use of serum alone would be a waste of money, because the immunity from this method is so short.

Method to Use.—In infected herds, this station usually advises the simultaneous method on all healthy hogs, except sows heavy with pig or with litters less than six weeks old. Such sows and their litters may receive serum alone, but should be re-immunized with serum and virus six to ten weeks after farrowing. Temperatures should always be taken before vaccination and the animals which have over 104 degrees F. should be considered already infected and given serum alone, using a 50 per cent increased dosage.

Pigs from immune sows are slightly resistant, but should be closely watched; and if any show signs of cholera they should be given the serum alone. This will usually carry them well past the weaning time, when they can be given the simultaneous treatment. If the herd seems to be extraordinarily susceptible to cholera, however, it will be necessary to give the serum alone more than once in order to carry them several weeks past weaning. Pigs given the simultaneous treatment soon after weaning time sometimes lose this protection within a few months. To acquire a long-time immunity, pigs should weigh at least 50 or 60 pounds at the time of receiving the simultaneous treatment. At this weight the immunity usually lasts the ordinary lifetime of the hog. Certain swine raisers in this State, whose herds are constantly exposed to infection and who have developed a thoroughly immunized lot of brood sows are able to permanently immunize the pigs at six weeks of age by injecting a slightly increased dose of virus (2 c. c.) and a small dose of serum (15 c. c.).

Warning Visitors.—All hogs giving visible symptoms should be killed or placed in isolation pens without vaccination. It is a waste of money to treat visibly sick hogs. Notices should be posted, warning visitors to keep out, and the premises should be considered infected for at least 30 days after the disease has disappeared. Linen posters printed as follows can be obtained free by writing to the Veterinary Division, University of California, Berkeley, California:

> WARNING
> The hogs on these premises have been vaccinated with
> VIRUS AND SERUM
> No visitors allowed in these pens and fields.

> NOTICE
> The hogs on these premises are free from cholera.
> Owners of infected herds are
> WARNED TO KEEP AWAY
> No visitors allowed in hog pens or fields without permission. Trespassers will be prosecuted to the full extent of the law.
> (Signed).....

In exposed herds where no sickness is present, the use of the simultaneous method is advised. The vaccination of sows heavy with pig and those having litters less than six weeks old should be postponed, and such animals isolated in pens protected from the possibility of infection.

The immunity of small pigs frequently disappears in four to six months; therefore it is advisable when no sickness is threatened to postpone the vaccination of pigs until they weigh at least 50 pounds. The sows on which such pigs are suckling should not be given virus with serum until the pigs are treated. When it is deemed necessary, serum alone may be used on sows and their pigs, but after an interval of several weeks they should be re-immunized by the simultaneous method.

The use of the so-called double method, consisting of serum alone, followed in ten to fourteen days with serum and virus has not proved satisfactory under California conditions. Unless an interval of at least three weeks is allowed to elapse between injections, immunity appears to be much shorter than that conferred by the simultaneous injection.

Four million pounds is the estimate of the wool clip in the vicinity of Roswell, New Mexico. This is 1,000,000 pounds more than the average.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

DAIRYING.

A carload of hogs was recently shipped to Los Angeles by the F. D. Campbell Company of Tulare.

Ten Holstein cows were recently sold by H. B. Goecken of Livermore to the Philpot dairy of Pleasanton.

S. P. Kelly, of the Clover View Farm, Ferndale, will make a showing of his Jersey cattle at the Panama-Pacific Exposition.

The total number of Guernsey cows now being tested in the United States is 1189. Two hundred and forty three Guernsey breeders in the United States have cows on Advanced Registry test.

The Visalia Co-operative Creamery paid dairymen $27,778 for the 240,000 pounds of cream delivered during June. Of this, 79,000 pounds found a ready sale through the company's Los Angeles house.

The Yolo-Sacramento Cow Testing Association reports that of the 950 cows tested during June, 27 produced more than 45 pounds of butterfat. On account of feed conditions, this showing is not as good as that of the past few months.

An organization was recently formed in southern California, known as the California Milk Producers' Association. An active campaign for membership is being conducted, the association having 185 members at the present time.

For the delivery of 130,821 pounds of butterfat during June to the Danish Creamery Association of Fresno, dairymen received $38,617. This shows a decided increase over the same month of 1914, when only 124,067 pounds of butterfat were handled.

A party of eastern dairymen and milk dealers were guests recently of the Humboldt Chamber of Commerce on a trip of inspection through that county for the purpose of studying the methods employed in the dairies, creameries, and milk condensing plants.

The second annual consignment sale of Holstein cattle will be held at Hanford on October 14. It is said that more than one hundred head have been promised, and the sale will be better and bigger than the one held last year. A sale of purebred hogs on the following day is being discussed.

A total of $54,300 for butterfat delivered during June was paid to Tulare dairymen by the Dairymen's Co-operative Creamery and the Good Luck Creamery of that place. On account of failure to collect for its product sold in Los Angeles, the Tulare Co-operative Creamery has postponed payments until July 25.

Dairies in the vicinity of Stockton will shortly be visited by the City Food Inspector and the State Veterinarian for the purpose of examining the cattle for tuberculosis, in order to give the dairymen a chance to rid their herds of infected cattle before the law, compelling them to kill them, takes effect on Oct. 1.

The world's record for butter has again been broken by a Holstein cow. Finderne Pride Johanna Rue No. 121083 H F H B, in a 365-day test under the supervision of the New Jersey Agricultural College produced 28,403.7 lbs. milk, containing 1176.47 lbs. butter fat. She was bred by Bernhard Meyer of Finderne, N. J. and is owned by the Somerset Holstein Breeders' Company of Somerville, N. J.

Malcolm H. Gardner, Supt. Advanced Registry Office, Holstein-Friesian Association, advises us that the cow Lucille Jolie Pontiac 144478, owned by Peter Small, Chesterland, Ohio, has broken the record for fat production in the senior four-year class, by producing in seven consecutive days 19.148 lbs. fat from 463.1 lbs. milk.

The Pacific Coast Jersey Cattle Club will suspend operations on August 1, no applications for registry or transfer being accepted after that date. Arrangements have been made with the University of California to have the records placed on file for any needed reference at the University Farm, Division of Animal Industry, Davis, Cal. Lack of interest in the affairs of the Club has been given as the cause of its dissolution.

Since the heavy importations of butter to Australia started this spring, it has been apparent that some butter and cheese inspector should certify and correct the grade and quality of all butter and cheese being shipped. Most foreign countries have import laws which demand that all dairy products be properly graded and inspected by government and State officials from where they are shipped; and as California has not previously had such an inspector, Secretary Andreason of the State Dairy Bureau last week appointed T. J. Harris official scorer for the Wholesale Producers' Exchange at San Francisco. Mr. Harris will inspect all butter shipped to foreign countries and certify as to the grade of each shipment. The cost of this inspection will be borne by the consignor and will be paid to the State Treasurer, from whom Mr. Harris will receive his pay. This step is one in the right direction and should be a considerable aid to butter shippers in the future.

CATTLE AND SHEEP.

There were 80,000,000 sheep in Argentine at the end of 1914.

RECISTERED O. I. C. SWINE—C. D. CONWAY, Lakeport, Cal.

POLAND-CHINA HOGS—C. A. Stowe, Stockton, Cal.

SHEEP.

12 RECISTERED SHROPSHIRE RAMS for sale, sired by Clover Hills' Crested Wave A. T. (011590R) 300968. Age 2 to 4 years. Ranch 4 miles north of town. Harry L. Huston, R. 2, Box 23a, Winters, Cal.

FRANK MEACHAM, Petaluma, California.—Breeder Shropshire, Rambouillets, American Merinos, both sexes. Take electric car at Santa Rosa or Petaluma for Live Oak.

SHROPSHIRE LAMB BUCKS—Yearlings and two-year-old rams for sale. J. B. Bloom, Dixon, Cal.

BULLARD CO.—Breeders and Importers of Rambouillets. Hanford, Cal.

CHAS. KIMBLE—Breeder and Importer of Rambouillets, Hanford, Cal.

BISHOP BROS., SAN RAMON, CAL.—Breeders and Importers, Shropshires.

MISCELLANEOUS.

OWING TO THE MANY requests of our customers to give them information as to where they can buy or sell dairy stock, we have established a livestock bureau in connection with our office. For anything in this line write us. V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

FOR SALE—8 Holstein cows and heifers. 2 Percheron Fillies. All high grade or registered. Home grown, excellent stock for foundation breeding. Call to see them at the home place, Glenoak Farm of L. N. Irwin, Davis, Cal.

FOR SALE—Young calves from good mixed dairy cows. P. O. Box 213, Antioch, Cal.

menced in Elko, Nevada, ten cars being shipped recently.

A full flock of Shropshires will be displayed at the Panama-Pacific Exposition this fall by Chas. Cleveland, Jr., of Gresham, Ore.

One thousand head of cattle were recently delivered to the eastern markets by Thos. Saulsbury for Oxnard & Giles of Merced county.

The five states in the Union which have the greatest number of shearing sheep are, according to rank, Montana, Wyoming, Ohio, New Mexico, and Idaho.

Plans for the biggest and most complete cattle show ever staged at a district fair are being made by the Directors of the Fresno District Fair, a total of over $3,000 having been appropriated for premiums.

Williams & Moore, the Stockton wool factors, recently sold this season's wool clip of Callaghan & Owens of Livermore for 25 cents a pound. This is said to be the best wool sale made in that section since 1870.

Honduras is reported to have about 1,000,000 head of cattle, for which at present there is no market except local consumption. With the opening of the Gulf ports of the United States to Honduras beef, it is reasonable to expect an increase in the cattle industry there.

Frank L. Harding, Sec'y of the American Shorthorn Association, will shortly make a trip to South America, the purpose of his journey being to make a study of conditions there and to endeavor to secure for this country the trade in purebred bulls, which has been going to England.

Kings county dairymen received $140,000 for their product delivered to the creameries during June. The grading rules recently adopted by Kings county creameries have proved very profitable to the dairymen, as is shown by the increase in the cream checks.

It is reported that the destructive Texas fever has broken out in the San Joaquin Valley, 100 head of cattle belonging to Miller & Lux on their Firebaugh ranch having died. Every effort is being made by the Federal authorities and the State Veterinarian to stamp out the disease.

HORSES AND SWINE.

W. A. Young of Lodi recently shipped a fine young Poland China pig to a breeder in Guatemala.

Buyers, reported to be purchasing for the European armies, have been securing horses in the Livermore Valley recently.

Co-operative work against swine diseases is being carried on in Glenn county by the Farm Bureau, assisted by Dr. B. J. Cady of the U. S. Dept. Agr.

A carload of horses was recently shipped from Elko, Nevada, to Denver and Kansas City for the European allies This makes the fifth car to go from that point within the last few weeks.

Rumors in Chicago are to the effect that the trade in horses for army purposes is on the decline; and the best posted men claim that the domestic demand will gain strength from now on.

It is stated that within the last two weeks about $20,000 has been spent by the British Government in Stockton and vicinity for horses for war purposes, 150 horses having been purchased within that time.

We have been notified by Farm Adviser J. W. Mills of Solano county that the movement which started for the holding of a colt show has met with such favor that a regular horse show will be held at Rio Vista in conjunction with the annual water carnival. A committee has been appointed which is getting the horse breeders in line, and it is expected that the show will draw from the region around Rio Vista, extending across the river into Sacramento county and the Islands up and down the river for a considerable distance. Many of the stock growers are now feeding and grooming their stock for the show. Prizes will be awarded. Committees have been appointed at Suisun, Dixon, Vacaville, Cordelia, and Vallejo for the same purpose, but no dates have been set for the shows.

MISCELLANEOUS.

Receipts at the Portland Union Stock Yards for the week ending July 12 were: Cattle, 1000; Hogs, 2700; and Sheep, 1700. Choice steers sold at $7.00; top hogs went at $7.40; and choice lambs sold at $6.50.

The American meat packers whose cargoes have been seized by the British Government have been renewing action in the matter; and it is expected that this complaint will form an important part of the note to be sent to Great Britain in regard to trade interference.

Architects are drawing up plans for a handsome new building to house the San Francisco Veterinary College. It is expected that the structure will be one of the most extensive and best equipped veterinary hospitals and schools in the country.

A number of intending exhibitors in the Middle States have joined for the purpose of making shipments of trainloads of livestock to the Panama-Pacific Exposition. It is contemplated that some of these shipments will be made from the Royal Show at Kansas City.

DUTCH BELTED CATTLE.

To the Editor: Will you kindly state whether the breed of cattle known as the Dutch Belted originated in the United States or in Europe? If the latter, about what time were they introduced in America?—J. G. R., Ceres.

[Dutch Belted cattle originated in Holland during the 17th century, and for two centuries they were owned and controlled by the nobility of that country, who kept them pure and limited their number to nobility ownership. They were first introduced into this country about the middle of the 19th century from Holland and have gradually made progress.—Editors.]

HORSE'S SHOULDERS SORE.

To the Editor: My horses get sore shoulders or collar galls once in a while and I have trouble healing them properly. Can't get the hair to grow again where the sore has been, though I try salves, liniments and washes. Is it a good thing to bathe warm, sweaty shoulders with cold water to harden them? Kindly give me a good healing remedy that won't leave an unsightly blemish.—R. S., Hanford.

[Once shoulders become sore it is almost impossible to prevent blemishes; prevention of such conditions is by far the best remedy. Be sure your collars fit properly. Use the following to rub in the shoulders at night after work: Acetate of lead, 5 oz.; zinc sulphate, 4 oz.; acetic acid, 8 oz.; water enough to make one gallon; shake well before using. Cold water is good to wash off hot shoulders.]

Make Old Buildings New

by covering roofs and sides with RU-BER-OID. The illustration above shows old barns and sheds on the George Mixter farm, Hardwick, Mass., made weatherproof and as attractive as when new by the application of RU-BER-OID on the roof and to cover the outside walls. This work—done years ago—put an immediate end to repair bills on these buildings. It helps protect them from fire and it keeps the stock warm in winter and cool in summer.

You can make your old farm buildings more attractive, and at the same time add many years to their life by covering them with

Pronounced "RU" as in RUBY

RU-BER-OID ROOFING

COSTS MORE - WEARS LONGER

RU-BER-OID was the first pliable, ready-to-lay roofing. It has been made under the supervision of expert chemists from the *same* formula for 23 years. It costs more than ordinary prepared roofings, but it is *worth* more. Its durability is proved by the fact that hundreds of buildings roofed with RU-BER-OID *more than 20 years ago* are still water-tight. RU-BER-OID is therefore *cheaper by the year.*

RU-BER-OID Roofing is always made of a dense, durable felt, free from wood fibres, paper stock, sand, coal tar or asphaltum oils.

Look for the RU-BER-OID Man

The "Ru-ber-oid Man" shown at the left appears on every roll of RU-BER-OID Roofing. If the Ru-ber-oid Man is not there, the roofing is *not* RU-BER-OID.

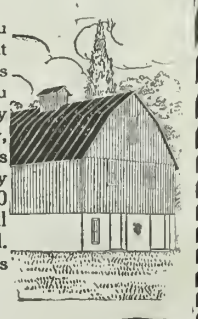
The United States Appellate Court, October Term, 1914, enjoined manufacturers of imitations from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing.

Colored RU-BER-OID (Ka-lor-oid)

—made in Tile Red and Copper Green, possesses all the long wearing qualities of the gray RU-BER-OID. These attractive colors are permanent—*built into* the roofing

Building Books Sent Free

Our **Barn Book** gives plans for building different types of barns. **"Roofing a Home"** shows how to lay handsome, fire-resisting, wear-proof roofs. **"Building a Poultry House"** gives practical plans. Other books show how to roof bungalows, garages, and factories in the most attractive and economical way. Any of these books will be sent free on request. *Mark and mail the coupon now.*



THE PARAFFINE PAINT CO.
San Francisco, Cal.

Also Manufacturers of Amiwud Wall Board and Ruberine Roof Paint.

For Your Home you want a roofing that will look well and wear well—a roofing that cannot warp, rust, rot or crack—a roofing that will help to keep your family comfortable in all extremes of weather. RU-BER-OID meets your requirements.

For Your Barn you want a roofing that requires no repairs—a roofing that you can apply quickly and economically, and one that has *proved* its durability by more than 20 years service in all parts of the world. That roofing is RU-BER-OID.

For Small Buildings—sheds, poultry houses, etc., you want a *durable* roofing that is *permanently* weatherproofed—a roofing that will not begin to crack and leak after a few years' wear. Roof with RU-BER-OID and be safe.

Veterinary Queries and Replies.

[Answered by Dr. H. D. Wintringham, Petaluma, Cal.]

SCABS ON RABBITS' EARS.

To the Editor: My rabbits have a scab-like appearance of the ears, resembling cold-sores in the nose of a child. I have had purebred Belgians for six years, but never this trouble before. What is it, and what's the remedy?—Mrs. C. N. O., Livermore.

[Your rabbits have ear mange. Get some lime-sulphur solution used for dipping sheep. Warm this and wash the ears every other day. It will disappear in about ten days.]

MARE AFRAID OF AUTOMOBILES.

To the Editor: For the last two months my mare has been very much afraid of automobiles. Although never a runaway, she has always been very nervous. How can I cure this?—M. S. H., Meridian.

[Your mare's trouble is due to defective eyesight. The trouble could be remedied by a thorough examination of the eyes and glasses fitted to the bridle to equalize the defective sight, but this would be very expensive and would have to be done by a man who understood his business.]

BLOOD FOUND ON COW'S TAIL.

To the Editor: The other morning I noticed one of my cows with blood on its tail and I washed her out. Is this a case of contagious abortion, or can it be due to natural causes? I think she has been fresh about three months.—Inquirer, Modesto.

[This may or may not be contagious abortion; the history of your herd would have much to do with a diagnosis in your case. If this cow comes in heat again within the followng three weeks since you found her with this discharge you may begin to suspect contagious abortion. Also, if any of your other cows show like symptoms you may consider you have this present in your herd.]

RUPTURED NAVEL.

To the Editor: I have four calves, two heifers and two bulls—age two and three months—which are ruptured in the navel; have been that way about a month. We feed them milk and cocoanut meal, beside dry pasture to run on. Can you tell cause and if we can do anything to cure them? We also have a fine milk cow which had a swelling in her throat about a month ago; now she has another up on her jaw bone. She has run to barley hay which has some foxtail in it. Could this be the cause? Cow is in good condition and otherwise all right. Has been fresh about four months. We haven't been able to get her with calf yet.—C. C. B., Galt.

[Have a competent veterinarian operate on the calves for the ruptures. This offers the only remedy. Feel for a soft spot on your cow's swelling and when found, lance same with a sharp knife to allow the pus to escape.]

MILK THICK.

To the Editor: I have a Durham-Jersey heifer with first calf, three weeks old. The cow is giving four gallons of milk per day but there is something queer about the milk and cream. Tbe first week after calving the back half of the udder was caked and much lumpy milk was produced; but when the udder became normal and the milk flowed free, the cream was lumpy and part non-soluble in hot water. When thick it does not have the same curdled look found in sour milk, but a more compact mass. We kept her cream separate and find the butter all right so far. Will she improve or will the cream always be the same?—H. H. H., Livermore.

[The condition of your milk is due to the original caking of the udder. The milk is still infected with the germs causing the garget. Give the following to your cow twice a day: Red iodide of mercury, 90 grains; potassium iodide, 60 grains; simple syrup enough to make one quart; dose, one ounce.]

CRUDE OIL FOR SCABBY PIGS.

To the Editor: Please tell me a good way to keep scabs off my white O. I. C. pigs. Does undiluted coal oil sprinkled on them to kill lice hurt the pigs?—Subscriber, Live Oak.

[Undiluted coal oil is too severe to use on animals; a little crude oil painted on their backs and behind the ears is far better. White pigs blister and become scabby in our California climate, and is one of the main reasons why they have never become popular in this state. Provide plenty of shade for them and a clean cement wallow, containing a 2 per cent solution of liquor cresolis compositus, on which is floated about one-half inch of crude oil. Allow them free access to this at all times. Clean out this wallow at least once every two weeks and put in fresh solution. This will not only act as a healing lotion for their scabs and sores, but will also keep them free from lice and help prevent other diseases.]

SWELLING ON HEIFER'S LEG.

To the Editor: My two-year-old heifer, that has been milking for about two months, has a swelling on the inside of the left hind leg, just above the udder. It does not seem to affect the milk or appetite of the heifer. The swelling is the size of a small bowl, is not sore, nor shows any heat or inflammation. It came on suddenly about two weeks ago, and I think has increased in size a little lately.—R. J. S., Crescent Mills.

[Have a competent veterinarian test this cow for tuberculosis. Lance the swelling at its lower point and allow the pus to escape. Syringe out the cavity daily with a 2 per cent solution cresol mixture.]

OLEANDER POISONING.

To the Editor: I had three cows which took sick Thursday, one died Sunday and one on Monday. They did not seem to suffer pain, but stood and lay around part of the time, not noticing anything. The doctor gave them two salts each of two days, then some croton oil and linseed oil; but nothing passed through them. They did not bloat. The veterinary cut both of them open when dead and found nothing that would throw any light on the case; everything seemed normal. Now, the day before they took sick we fed them some lawn clippings; and there were a few oleander sprouts that had grown up around the trees mixed in with the grass. If the oleander was poison, could not a veterinary detect it when he cut them up? One of the cows had been fresh only ten days and he said she had milk fever the last day, but I could not see any difference in them, only this one was more sick than the other one and died a day sooner.—E. P. C., Corning.

[Your cows died of oleander poisoning. The lesions found on autopsy after death from this cause are not characteristic and are often almost entirely absent. The symptoms you describe, however, are characteristic. One oleander top will usually produce death in cattle and horses. There is no specific antidote and cases must be treated symptomatically.]

Swineland
TAMWORTHS, DUROC JERSEYS. We have for sale fine young stock, both sexes; also boars ready for service and bred sows. No better stock in this State. We have recently moved our big breeding establishment from Yuba City to Woodland.

Tenant Reclaims Land.

To the Editor: I have 100 acres leveed land on Gridley Island, Suisun Bay, about 20 acres of which are broken and plowed and from wbich I am now hauling hay. The rest of the land is still in thick salt grass sod. I also have 10 Holsteins, 8 milking and 2 coming in, 2 mares, farm truck with platform, walking plow and Acme harrow, 5-room cottage, with running water, 32x32 barn, corrals, and some necessary fences. I desire to lease or rent the ranch on a share basis. This is a natural dairy country. Tbe isolation is the main drawback, having to haul cream 8 miles to a receiving station. Business interests require me to live in the city and I cannot afford to keep a man here. I would wish to lease to an experienced man, whether farmer or dairyman, and would also want a certain amount of tbe raw land broken and cropped annually. Can you give me any ideas of what such a share lease would be? How about the division of expenses, as new plowing, fencing, ditches, leveeing, and other permanent improvements?—R. B. Y., Pittsburg.

[There are many ways in which a fair agreement to both parties could be made, but any such plan is an experiment at best, till it has been tried out. On a much larger ranch than yours, still in the stage of development, a practicable working basis has been in operation several years in this wise: Tbe owner of the land provides buildings, dairy cows, utensils, farm implements, etc., together with sufficient improved alfalfa and corn land for supplying feed to the cattle. Each year a considerable acreage has been reclaimed, leveled, and checked, the owner hiring the labor and paying all other expenses, also paying the tenant a certain sum monthly for superintending the development work. The tenant furnishes all of the labor in farming the land, harvesting the crops, etc.; also all of tbe labor expense in running the dairy; and boards the farm and dairy help. For such work, he receives half of the gross returns from the ranch, as well as half of the annual calf crop. The owner receives enough from his half of the income to continue development work, and the tenant is not only able to make a good salary, but is gradually securing a fine herd of cows for himself. It would not be fair to the tenant to expect him to do your improving unless he secured some recompense for same, either in cash or free rent.—Editors.]

ROOT KNOT ON ALFALFA CROWN.

To the Editor: I am sending you an alfalfa plant that seems to be affected with a disease very much the same as root knot on our fruit trees. I have noticed several crowns of it this season. My stand is 6 years old, planted where I pulled out an old orchard. Can you give me any information as to same, through the columns of the Press?—F. H. Newcomb, Penryn.

[Comments by Professor Horne.]

The alfalfa plant from Mr. Newcomb is affected with a disease known as crown gall of alfalfa. This disease has been reported from a considerable number of places in central and northern California and also from adjacent states on the north and east. We have bad specimens of it for several years, and while it is probably increasing, it has nowhere become destructive so far as I am aware, although in some places it spoils an appreciable percentage of plants.

The name crown gall in this case is somewhat unfortunate, for the reason that these swellings are due to a fungus which does not attack other of our plants so far as I am aware. It has nothing to do with the crown gall of stone fruits and other trees, and there is no possibility of the trouble being derived from the old peach or almond galls left in the soil when an orchard is removed, nor is there any danger of this disease being communicated to fruit trees.

I am not aware that any method of treatment has been worked out for this disease, but I suppose that in case it should become serious the patch should be plowed up and planted to some other crop for a number of years.

Wm. T. Thorne.
University of California, Berkeley.

IMPORTANCE OF FAIRER MARKETING.

To the Editor: I was much interested in the article on "Agricultural Marketing Wastes" in the Rural Press of June 26. There has been too little attention paid to the marketing problem (and it is a big problem) in proportion to the attention that has been paid to the encouraging of the grower to raise more produce.

If less effort was expended in encouraging the grower to raise more (and thereby stand a chance of losing more) and more effort was made to get better returns for what he did raise (at no additional cost to the consumer) then there would be no need of worry about lack of production.—Farmer, Riverside.

SAN DIEGO CO-OPERATION.

Conditions in San Diego county have been such that a market for vegetables was almost lacking. San Diego has not been able to consume them and the outside world has been closed to the grower. The region surrounding the southern city of the sun is blessed with such climatic conditions that they can grow vegetables throughout the winter season. This fact allows them to supply the best trade of the northern and eastern markets, competing with only cold storage second-class goods.

The vegetable producers of San Diego county are organized into the "Ranchers' Market Association," and now signing up acreage for the marketing of winter vegetables. The by-laws of the Association have several features worthy of comment:

Every member must be a grower, allowing no antagonistic party a vote in the affairs of the organization. A personal note for $25 plus $1.00 for each acre cultivated is required. This is used as collateral to borrow money, so no capital stock is required. It is also a guarantee for the fulfillment of the agreement.

A solution of the downfall of many co-operative organizations: "In case any member is offered a price in excess of the price then obtained by the association, said member shall turn said bid over to the association for filling from said member's goods."

Thus if an antagonistic commission man or other party tries to break up the organization by overbidding until the organization is disrupted, the bid will be accepted but used to strengthen rather than weaken the organization.

Each member shall bave a number or mark permanently stamped on every package. Any losses due to quality or packing can be traced to the cause and one producer will not have to stand the losses of a poorer producer. The manager may also aid the poorer grower through showing him how to offer a first-class article.

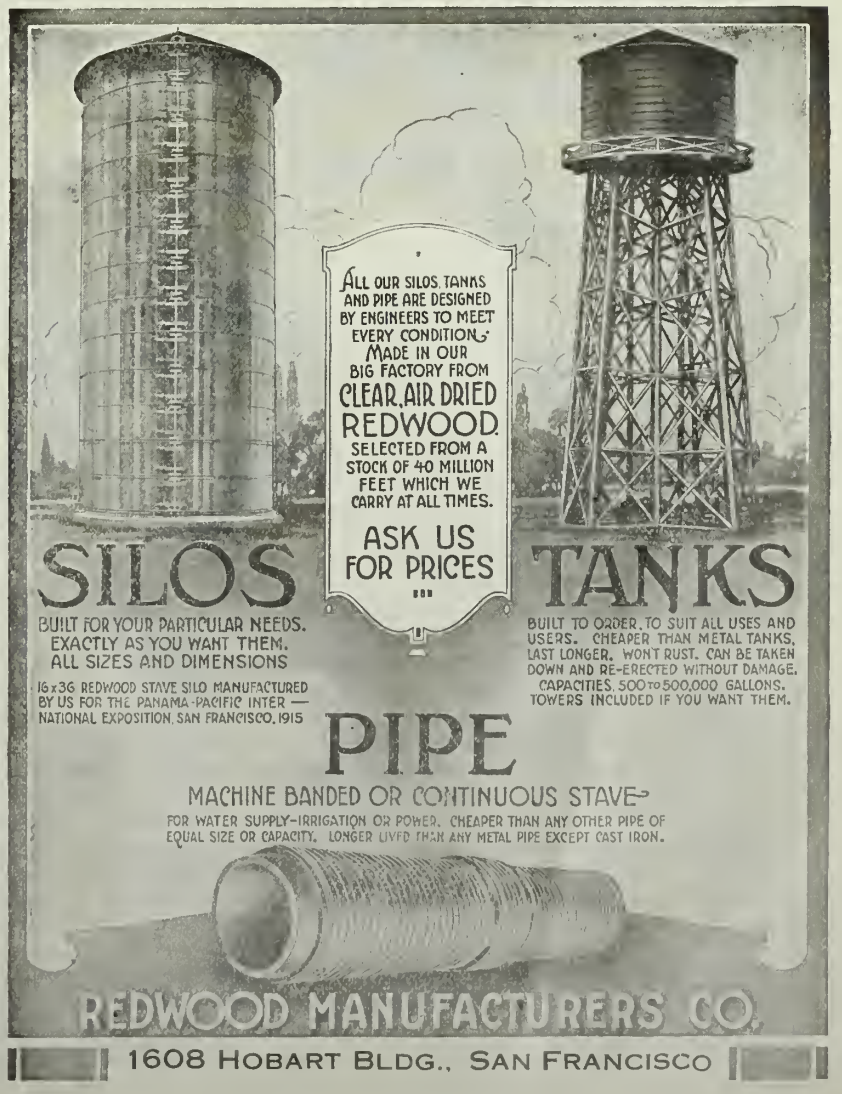
Each member shall have one vote only. No ring can control the organization, so it must remain distinctly co-operative.

At a meeting held in San Diego July 8 the following officers were elected: H. Culbertson, El Cajon, president; W. R. Edwards, Chula Vista, vice-president; J. R. Blakeston, La Mesa, secretary; First National Bank of San Diego, treasurer; J. R. Blakeston, La Mesa; Walter Starpe, Otay; J. Haughawont, La Mesa Heights; H. Culbertson, El Cajon; J. S. Scott, El Cajon; J. W. Tucker, Nestor; W. R. Edwards, Chula Vista, directors.

Only vegetables will be handled. In order to develop the best markets, the product must be limited in kind and variety, so only the following will be included at present: tomatoes, peas, cabbage, lettuce, rhubarb, peppers and celery. Others may be added from time to time as the membership sees fit.

The Department of Agriculture, in co-operation with the Agricultural College, has sent G. H. Wilson to act as an assistant to Mr. Weinland, and Farm Adviser, and to devote all of his energy to aid the growers in organizing themselves for co-operative marketing.

A shipment of butter for tbe Antipodes was scheduled to leave San Francisco on July 20. It will contain 800,000 pounds.



The Southwestern Stockman-Farmer states that there are still unsold for fall delivery some ten thousand very fine threes up native steers in the Flagstaff and Williams country; the Flagstaff sellers of threes feeder steers are holding at 6 and 7 cents. There remain in all northern Arizona less than 5,000 unsold fall yearlings. California buyers offering 5½ cents per pound for fall yearlings are not securing any response as yet.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

FARM HANDLING CAUSES LOSS.

The first thing that presents itself to mind when the weather gets up in the nineties is the care of eggs. Are we all doing the best we know to keep them in good condition until they finally reach the judge? The judge, in this instance heing the puhlic. When I see a neighhor go hy with his case of eggs in the back of his buggy, stop his horse to talk to some one in the road, a thing that often occurs in front of where I sit to write, I want to go out and tell him to deliver his eggs first, then come back and talk till morning if he wants to. One hates to meddle, because they ought to know without telling, that a case of eggs should not stand out in the sun.

In farmers' Bulletin 656 W. H. Kerr, Investigator in Market Business Practice, states that there is a total loss of 8 per cent of the eggs marketed. He further says: "Most of this loss is due largely to improper handling hetween the farm and the market. The hens forage for a living, eggs are gathered when convenient, and kept almost anywhere. With such carelessness and a combination of mongrel stock, dirty nests, stolen nests of broody hens, unconfined males, late maturing pullets and other undesirable conditions, is it any wonder that the product includes such a high percentage of small, cracked, dirty, stale, heated, and even rotten eggs?"

Now that is an awful long arraignment to bring against the farmers; and I for one would like to step right up and say, "We have none of that class of people on California farms," but I know that we have, so I'm tongue-tied. Careless people appear to be in the majority all the way from Maine to California. But the worst feature of it is, that merchants buy these eggs and sell them again mixed with eggs from the really conscientious producer as case count, so the one has to suffer for the other.

Quoting again from same Bulletin, the author says:

"Many of these losses can be prevented by: (a) Selecting pure breeds that lay more and larger eggs. (h) Giving better care, food and shelter, with dry, clean, vermin-proof nests. (c) Confining males, except in breeding season. (d) Collecting eggs frequently, especially in hot muggy weather. (e) Storing eggs in a dry, cool place until sold. (f) Using small and dirty eggs at home. (g) Marketing frequently, with protection at all times from heat. (h) Selling for cash on a basis of size and quality, "loss off," instead of case count. (i) Using an attractive package. (j) Combining shipments as a matter of economy.

Several Market Together.—Where there are a few farmers living close enough together, that have eggs all averaging 20 ounces to the dozen, this "egg circle," or co-operative method of marketing would be far better from a financial standpoint than for each one to sell separately. The Bulletin gives full directions for organizing the egg circle, and as it can be had for the asking there is no reason for anyone that can read heing without the very valuable information it contains. Simply write the Department of Agriculture, Washington, D. C., for Farmers' Bulletin 656, giving your name and address, and it will be mailed you free of charge.

We, on this coast, must he prepared to educate the thousands of immigrants that will come to us from other lands as soon as the war is over. The Pacific Rural Press will be a text book for them from which they will get their first lessons and we shall need to remember that. The very first lessons I learned on American cooking were taken from The Rural New Yorker. And I remember one time a real Yankee had supper with us one night on the prairie and I had Johnny cake for one dish. This man ate a piece of Johnny bread, reached out for another, and said, "Say, did I understand you were English?" My husband said, "That's what we are." "But say," he insisted, "nohody but a Yankee woman could make Johnny cake like that." After a good laugh my hushand told him I was a pretty good imitator when I had a printed recipe and the materials to boot at hand. Every body has to learn, and the "printed word" that is taken from a reputable farm paper is always taken at its face value, without any doubts or fears as to results.

Knowing these facts should make writers very careful, and I believe it does, because we all feel the responsibility.

Bran and Cottonseed Meal. — In what way is bran good for chickens? Is cottonseed meal good for them, how much should they have and in what way is it beneficial?—Mrs. F. C.

Bran is good for chickens because it is rich in protein and mineral. Young chicks fed partly on bran rarely have leg weakness or any such trouble. Feeding bran to hens helps make shell besides playing a great part in the egg proper. The value of cottonseed meal for poultry is doubtful. It is very hard to digest and requires more energy than heavy laying hens can spare. Personally I would rather pay five times more for a pound of pure flax seed meal than I would for cottonseed meal. Another thing against it is that it is constipating; and while it may contain some food value the hen has to wrestle with it to get it out.

Home Made Balanced Chick Feed. —Please give us a balanced ration for chicks two months old and up. Have been feeding ready-mixed chick feed, but it is too expensive when they get that age.—J. H.

One gallon of cracked wheat; one gallon cracked or whole Gyp corn; half pint millet seed; half pint hemp seed, one quart of oat groats or pearl barley and two pounds beef scrap.

This makes a little finer feed than the average; the millet can be left out for chicks two months old and if small wheat can he obtained it would do as well as cracked wheat. Of course the chicks should have some mash besides. For this, good heavy bran and ground oats and gyp corn with a little bone meal and beef scrap added will make a good growing ration. Bone should be about 5 pounds to the hundred and beef scrap about ten pounds to the hundred of other feed.

A friend of Nat Goodwin was staying with the actor at his home in California, in the hope of obtaining relief from chronic dyspepsia. One day he was taking a walk along the beach with his host.

"I have derived relief from drinking a glass of salt water from the tide," said the invalid solemnly. "Do you think I might take a second?"

Goodwin reflected deeply. "Well," he replied with equal seriousness, "I don't think a second would be missed."—Osteopathic Magazine.

Gas Stove Convenience with Kerosene

Hot in *Your* Kitchen?

No need of it if you cook with a good oil stove. The heat is concentrated on the cooking—not radiated throughout the room.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Abundant heat—always ready at the touch of a match—like gas. Can be turned out the minute you finish cooking. Cooks anything your wood or coal range does—and there's no heavy hods to lug—no dirt or ashes. No odor. Does not taint the food. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

SOLD AT ALL GENERAL STORES

If your dealer has not yet got Flykill in stock, send ushis name and 30c in stamps and we will send you a full-size bottle, securely packed, by mail.

POULTRY NOTES.

[By Geo. H. Croley, President California Federated Poultry Assn.]

We have received the 1915 edition of Standard of Perfection, published by American Poultry Association. This is the standard by which the Fancy or Standard bred fowls will be judged at the Panama-Pacific Poultry Show in November. It contains 368 pages illustrated with numerous engravings; cloth binding, price $2.00 postpaid.

In former issues we stated that two attendants would be allowed to accompany full carloads of poultry shipped to the Poultry Show at the Exposition. The railway companies interested have decided that the express companies may only allow one attendant to travel in the car free and have made a ruling to that effect.

T. E. Quisenberry, Superintendent of Poultry at the Exposition, has returned from a trip to the eastern states and is now preparing an interesting program for the meeting of the American Poultry Association and for the week in November occupied by the Panama-Pacific Poultry Show.

Besides the question of a poultry text book for public schools, the breed standard, the market poultry and egg standard, the report of important committees, new business of great importance, social gatherings, sight seeing trips, and many other things that will add to the pleasure and benefits to be derived from these two great meetings, there will be a series of lectures delivered by some of the most prominent poultrymen of this country.

I wish to inquire whether it would be possible to purchase day-old ducks or geese in the early fall and whether they could be successfully raised at that season. If so, can you furnish me the address of such hatchery?—M. C., Tranquillity.

It is possible to produce duck and goose eggs that are fit for hatching in the early fall, but only a very few breeders understand how to do so; besides, at that season of the year the demand for day-old ducklings and goslings is so limited it is practically impossible to find any one prepared to supply them at that time. If hatched from good fertile eggs ducks and geese may be raised in California at any season of the year, but abundant shade is absolutely necessary in hot weather.

I have a number of Rhode Island Red chickens a few weeks old with very few feathers. What is the cause of it? My neighbors say it is feather lice. If so, is there anything I can do?—Mrs. Wm. J., Modesto.

It is natural for the larger breeds of fowls, such as Rhode Island Reds, to be more or less scantily feathered at certain periods of chickhood, but the lack of feathers might be, to a certain extent, due to feather lice. If these are present they may be readily detected by examining the chicks. They are usually found on the larger feathers of the wings and tail. Any good insect powder or very fine flowers of sulphur rubbed into the plumage will destroy them.

STATE POULTRY SHOW.

The poultry show to be held at Sacramento January 14-18, 1916, will be a joint exhibit of the Sacramento Poultry Association and the California State Poultry Association. In order to provide the newly organized State association a means of economically giving an initial show, the Sacramento local association has generously delegated the entire management of this show to the officers of the State association, which naturally is not yet financially strong enough to carry through an independent show. C. A. Wilkins, Sacramento, the secretary, states that W. S. Russell and C. G. Hinds have been appointed as judges and that the other judge will be announced later.

SCABS IN RABBIT EARS.

The scabs in the rabbits' ears mentioned in the issue of July 17 seem to have been destructive to quite a number of rabbit owners, and is called the "ear and mouth disease."

The ears seem to fill up with a scab from somewhere deep down, looking at first like ear-wax, according to Mrs. C. N. Oaks of Alameda county. Several of her Belgian hares were badly affected, and were first noticed when they refused to eat.

To treat them she diluted peroxide of hydrogen with an equal quantity of water and poured it into the ears. One buck which had refused to eat for three or four days and seemed certainly lost was treated twice on Sunday and began to eat again Monday. It is doing very nicely now, while the others which were affected are practically well.

Four to five months old pullets, $18 per dozen. Selected Cockerels and Cock Birds, $5 each and up.

California Poultry Practice

Written to Teach Better Poultry Methods on the Farm.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poutry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers

525 Market Street, San Francisco.

The Home Circle.

THE DEAREST SPOT ON EARTH.

The dearest spot on earth to me
  Is home, sweet home;
The fairyland I long to see
  Is home, sweet home;
There how charm'd the sense of hearing,
There, where love is so endearing!
All the world is not so cheering
  As home, sweet home.

I've taught my heart the way to prize
  My home, sweet home;
I've learned to look with lover's eyes
  On home, sweet home;
There, where vows were truly plighted,
There, where hearts are so united!
All the world beside I've slighted
  For home, sweet home.

—W. T. Wrighton.

BILLIE FAIRFIELD'S PROMISE.

When Billie took the milk to Mrs. Selden one morning, and she asked him if he would bring another quart that night, he said "Yes'm" promptly, and then never thought of it again until he was in bed.

"Well, I can't take it now," said Billie; but he could not go to sleep, though he turned and tossed and twisted till he was tired. At last he went to the head of the stairs, and shouted, "Mother!"

Mrs. Fairfield had just threaded her needle and stretched a stocking with a big hole in it over her hand. She said, "Oh, dear!" but she went to see what Billie wanted.

"You'll have to go now," she said quietly, when he had told her.

"Oh mother! I can't go away up there alone." Mrs. Fairfield knew that, for Billie was never out alone at night. His father had gone to bed downstairs with the baby; and, if they waked him, baby would wake too. So Mrs. Fairfield thought a minute. Then she said: "We'll see. I'll have the milk ready when you come down."

When Billie got into the kitchen, his mother stood at the door with her hat and shawl on. Billie began to feel ashamed. He wished he dared to go alone; but he did not, for it was a lonesome road. He took the milk, and they tramped over the snow up the long hill without a word. The wind blew in their faces, and Billie's ears were cold; but he had the milk-can in one hand, and pulled his sled with the other, so there was no way to warm them. He was ashamed to ask his mother to take the milk.

Mrs. Selden exclaimed when she opened the door: "Why, what made you come away up here to-night? And you, too, Mrs. Fairfield! It's too bad! I could have got along somehow without the milk."

"Billy promised you," Mrs. Fairfield answered. And Billie wished nobody would look at him.

"'Twasn't any matter, she said, mother," he urged, when they had started for home again.

The wind was in their backs now, and Billie's ears were warm.

"The matter was your promise, Billie," said his mother. "Would you break a promise just to get rid of walking up to Mrs. Selden's!"

Billy made no answer. He was ashamed again.

Presently he asked his mother if she would slide down hill. Mrs. Fairfield laughed; but she tucked herself up on the front of the sled, while Billie stuck on behind, and they slid down the long hill to their own yard, where Billie skillfully steered in. His mother praised the way he managed his sled, but Billie was still uncomfortable.

"Why don't you say something to me, mother?" he said, while they were warming themselves at the big coal-stove.

His mother smiled at him.

"I'll tell you how you will be punished, Billie," she said. "It's too late to finish mending these stockings tonight, so I shall mend them tomorrow when I was going to make a cottage pudding, and there'll be no pudding for dinner."

He and his father would say "cottage pudding" to each other for a long time afterward if anything was in danger of being neglected or forgotten. When Billie had grown to be a man, and people said, "Just give me Billie Fairfield's word; that's all I want," Billie would smile, and say, "Yes, my mother taught me to keep a promise."—A. M. L. Hawes, in Sunday School Times.

COMRADES.

Bobby was ten years old, and an alarmingly light-hearted and careless young person. It was supposed, however, that he would be capable of escorting his grandmother to the family birtbday dinner, one block away from her home, without mishap.

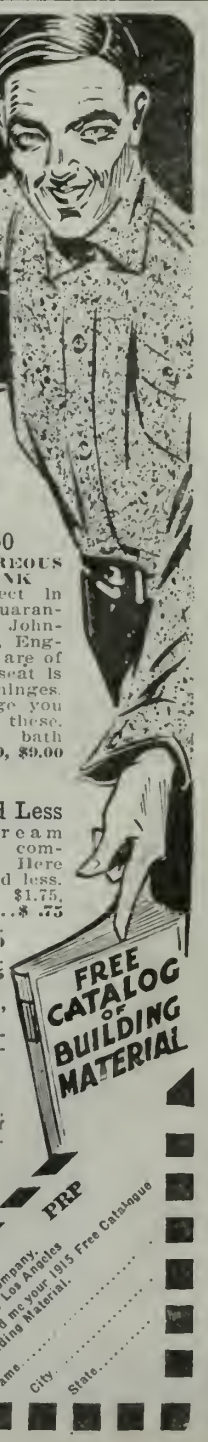
He was tall for his age, and he offered his arm to his grandmother in a gallant and satisfactory manner as they started off together.

"I hope he will remember that she is almost ninety, and not try to hurry her. I'm sure I've cautioned him enough," said Bobby's mother, as she began to dress her younger children. But, when she arrived at the family party, it appeared that grandmother had turned her ankle, and was lying on the lounge.

"Bobby," said the mother, reproachfully, "where were you when grandma slipped?"

"Now I won't have that boy blamed," said grandmother, briskly, smiling up into Bobby's remorseful face. "We came to a fine ice-slide, and he asked me if I thought we could do it, and I told him I did. And I want you children to remember one thing: when you get to be 'most ninety, you'll count a turned ankle a small thing compared with having somebody forget that you've outlived everything but rheumatism and sitting still. Anybody that likes can rub this ankle a minute or two with some liniment, but I want Bobby next me at dinner, mind!"—Youth's Companion.

AUGUST WORK WITH FLOWERS.



The work in the flower garden for August is important if you expect to have fall blooms from dahlias, chrysanthemums, begonias and roses.

Amaryllis should be helped through the ground with a little water, and more wetting as the flower stems break through.

Asters need water and liquid manure to do their best, but when flowers appear water the roots only to get best blooms. Chrysanthemums should be protected from leaf lice with tobacco extract or tobacco dust thrown into the leaf clusters where they first appear. If your plants have not been staked you should do so before blooms weight them down. Give plenty of water and some liquid manure. Dis-budding of selected shoots should be carefully attended to.

Cuttings of favorite roses may now be put in; select half-ripe wood which has perfected its flowers. Pieces of stem about four inches long, with heel or cut just below the joint will do. Insert in sheltered, sandy soil and let them remain un-

til growth commences. With older bushes thoroughly soak the ground, dig in some fertilizer and you will have fine Thanksgiving roses.

Chinese primrose seedlings should be started for winter flowers.

Beginnings may also be made in the planting of bulbs for winter blooms. Wet and dig the soil deeply, and keep moist till the fall rains come.

Cultivate the ground around violets, water, and remove runners. Mulch lightly with manure.

Sow seeds of pansies, hollyhocks, canterbury bells, carnations and other early spring flowering plants. Early sown seeds make plants which will give blooms early in the winter and last into spring.

Attend to watering and fertilizing dahlias and cannas. Stir soil frequently and keep well staked. Dahlias should give good blooms during August, September and October. Some plant lovers have fine dahlias as late as Christmas.

FADS IN THINGS TO EAT.

Celery is invaluable as a food for those suffering from any form of rheumatism, or diseases of the nerves and nervous dyspepsia.

Lettuce for those suffering from insomnia.

Watercress is a remedy for scurvy.

Peanuts for indigestion. They are especially recommended for corpulent diabetes. Peanuts are made into a wholesome and nutritious soup, are browned and used as a coffee, are eaten as a relish simply baked, or are prepared and served as salted almonds.

Onions are almost the best nervine known. No medicine is so useful in cases of nervous prostration, and there is nothing else that will so quickly relieve and tone up a worn-out system. Onions are useful in all cases of coughs, colds, influenza; in consumption, insomnia, hydrophobia, scurvy, gravel and kindred liver complaints. Eaten every other day, they soon have a clearing and whitening effect on the complexion.

Spinach is useful to those with gravel.

Asparagus is used to induce perspiration.

Carrots for sufferers from asthma.

Turnips for nervous disorders and for scurvy.

Raw beef proves of great benefit to persons of frail constitution and to those suffering from consumption. It is chopped fine, seasoned with salt, and heated by placing it in a dish of hot water. It assimilates rapidly and affords the best nourishment.

Eggs contain a large amount of nutriment in a compact, quickly available form. Beaten up raw with sugar, they are used to clear and strengthen the voice. With sugar and lemon juice the beaten white of egg is to relieve hoarseness.

Honey is wholesome, strengthening, cleansing, healing and nourishing.

Fresh ripe fruits are excellent for purifying the blood and toning up the system. As specific remedies oranges are aperient. Sour oranges are highly recommended for rheumatism.

Cranberries for erysipelas are used externally as well as internally.

Lemons for feverish thirst in sickness, for biliousness, low fevers, rheumatism, coughs, colds, liver complaint, etc.

Blackberries are a tonic. Useful in all forms of diarrhoea.

Tomatoes are a powerful aperient for the liver, a sovereign remedy for dyspepsia and indigestion. Tomatoes are invaluable in all conditions of the system in which the use of calomel is indicated.

Figs are aperient and wholesome. They are said to be valuable as food for those suffering from cancer; they are used externally as well as internally.

JUDGMENTS.

No man should let the alimony stand between a woman and her happiness.

A friend in need is a friend in hiding.

Be not weary in well doing. Automobiles do their best work when thoroughly tired.

The sincere civil service reformer is the department clerk who holds over from the last administration.

"Monkeys in the zoo object to being finger-printed." Humiliating, but conclusively supporting the Darwinian theory.

Statesmen may go as far as they like in cutting out public expenditures in which the other fellow is interested. If they take us for the other fellow, they may be long on rectitude, but they'll be short on votes.—Judge.

WANTED TO KNOW.

One evening at the opera a man, from the country evidently, seemed very restless and constantly consulted his programme. He was much agitated and not much accustomed to address strangers.

Finally his curiosity got the better of him and, turning to the man sitting next to him, he said: "Excuse me, but can you tell me, have they begun to play Wagner, or are they just tuning their fiddles?"—Ladies' Home Journal.

USES OF STALE BREAD.

Stale bread, if heated in a closely-covered pan, becomes almost like new. Keep pieces of stale bread by themselves in a jar or covered bowl. Stale slices may be used for toast. Dry broken pieces in a warm oven until crisp, but not brown. Crush them on a board with a rolling pin; sift the crumbs and keep them in a jar to use for croquettes, etc. They will keep several weeks. Coarser or browned crumbs may be used for the tops of scalloped dishes. Stale crumbs not dried are suitable for bread pudding and filling of scalloped dishes.

Hon. Benjamin Kimball, one of New Hampshire's well-known railroad men, is said to have complained to one of the butchers at Gilford about the quality of meat supplied, saying: "That lamb you sold me must have been old enough to vote. It was so tough I could hardly cut it." "Oh," said the butcher, "that is nothing; Tom Fuller said the last piece of meat he bought of me was so tough he could not get his fork into the gravy."

"Look here, Matilda," said a Galveston lady to the colored cook, "you sleep right close to the chicken-house, and you must have heard those thieves stealing the chickens!" "Yes, ma'am, I heerd the chickens holler, and heerd de woices ob de men." "Why didn't you go out, then?" "Case, ma'am"—bursting into tears—"case, ma'am, I knowed my old fadder was out dar, and I wouldn't hab him know I'se lost confidence in him for all de chickens in de world!"

"It's a beautiful day." "Yes," replied O. U. Grouitsch, the noted pessimist, "but unseasonable for this time of the year."—Baltimore American.

Mother (who is teaching her child the alphabet): "Now, dearie, what comes after 'g'?" The Child: "Whiz!"—Judge.

The Great Ant Killer.

A Simple Method of Dealing with This Pest

All sorts of remedies have been tried by housewives in the effort to exterminate the pesky little ant—an insect which has always been one of the most aggravating pests with which the good housewife has had to contend.

Invariably, however, these efforts have been without success, until the discovery of a paste by a baker in Los Angeles, which showed women the way to rid themselves of this annoyance forever.

This paste seems to have uncanny powers over ants. It not only drives them out of a house or store, but keeps them out thereafter. Originally prepared for the use of the inventor in his own shop, its fame soon spread with such rapidity as to cause its being placed upon the market for general use.

This little remedy is known as Kellogg's Ant Paste, and can be obtained at all modern druggists or grocers. Try a package today—and watch your ants disappear forever.

READY BUILT HOUSES

Build a Home—Not a House

And build it yourself. All you need is a little spare time, common sense and a hammer. The house comes to you "knock down" complete in every detail. You "follow the plans" which consists of putting the numbered pieces of material together, and the resulting home is one you will be proud to live in. You are guaranteed satisfaction, and a saving in money—not only in the cost of the home, but in loss from waste material and labor. Complete homes as low as $205. Today send for your catalogue—its worth having.

READY BUILT HOUSE COMPANY,
973 BROADWAY, PORTLAND, ORE.

The Markets.

Unless otherwise noted, prices are f. o. b. San Francisco.

San Francisco, July 21, 1915.

WHEAT.

The wheat market made a further advance this week in the East; and in consequence almost everything is firmer here. In the local market Club is still quoted as before, but other varieties have been marked up.

Cal. Club, ctl	1.72½ @ 1.75
Forty-fold	1.80 @ 1.85
Northern Bluestem	1.95 @ 2.00
Northern Club	1.72½ @ 1.75
Northern Red	1.75 @ 1.90

BARLEY.

Barley is also advanced in sympathy with the increased inquiry for export; and it is believed that a further upward movement may come at any time. Advices from Coast points show a smaller crop than was anticipated.

Choice Feed, ctl	$1.17½ @ 1.20

OATS.

Oat prices are stationary, probably because there is little or nothing offering. The feeling is for a firm market due to inquiries for export.

Red Feed	$1.35 @ 1.45
White	1.45 @ 1.50

CORN.

The market is very firm, with advances in some lines. There is nothing much offering in Californaia Yellow, which is now quoted at $1.80 to $1.85. Eastern Yellow is also up five cents. There is now no White in the market; but dealers say that choice White would bring $1.90 to $1.95 if any were to be had.

California Yellow	$1.80 @ 1.85
Eastern Yellow	1.85 @ 1.90
Milo Maize	1.75 @ 1.80
Manchurian	1.40 @ 1.60

BEANS.

The bean market is reported very quiet this week, with a general tendency to hold off transactions until a better idea of the size and quality of the new crop can be had. There is not much inquiry at present either for spot or future beans. There have been no changes in prices.

(On Wharf.)

Bayos, Cal., per ctl.	$3.50 @ 3.75
Blackeyes	5.50 @ 5.65
Cranberry Beans	3.50 @ 4.00
Horse Beans	2.25 @ 2.75
Small Whites	4.00 @ 4.15
Large Whites	3.75 @ 3.90
Pink	3.15 @ 3.40
Limas	4.00 @ 4.15
Red Kidney	4.90 @ 5.00
Mexican Reds	4.90 @ 5.00

SEEDS.

(Wholesale prices, San Francisco.)

Alfalfa	17½ @ 18½c
Brown Mustard, per lb	Nominal
Canary	10 @ 12½c
Hemp	3 @ 3½c
Millet	2½ @ 3 c
Timothy	7½ @ 8 c

HAY.

In spite of rather large arrivals the hay market continues in pretty good shape. What changes in prices are to be noted are in the way of advances. Not much new hay has been received in the San Francisco market but some transactions are reported in the country. The inquiry for hay for export continues. This has contributed largely to the strength of the market and has reduced stocks of old hay materially. Alfalfa hay is beginning to arrive rather more freely; and though the demand does not appear to be brisk, the prices realized are somewhat better than those of a week ago. In general prices show very little change.

track, San Francisco.)

No. 1 Wheat, per ton.	$10.50 @ 12.00
do. No. 2	8.00 @ 9.00
Barley	8.00 @ 10.00
Tame Oats	7.50 @ 11.50
Wild Oats	6.00 @ 8.00
Alfalfa	7.00 @ 10.00
Stock Hay	5.00 @ 5.50
Straw, per bale	.40 @ .45

FEEDSTUFFS.

There has been more activity this week, and a number of price alterations are reported. In sympathy with the firmer market for the whole grain, the price of rolled barley has advanced a dollar a ton. Oil cake meal, which has been out of the market, is again quoted, the price being from $38 to $40. Cocoanut cake has dropped a dollar and cracked corn has advanced to the same extent.

(Wholesale prices per ton, carload lots, San Francisco.)

Alfalfa Meal, ton	$14.00 @ 15.00
Alfalfa Molasses Meal per ton	18.00 @ 19.00
Bran, per ton	29.00 @ 30.00
Oilcake Meal	38.00 @ 40.00
Cocoanut Cake or Meal	24.00 @ 29.00
Cracked Corn	41.00 @ 42.00
Middlings	34.00 @ 36.00
Rolled Barley	25.00 @ 26.00
Rolled Oats	33.00 @ 34.00

VEGETABLES.

At this season the market changes very rapidly with the coming of new stocks. The asparagus season is now drawing to a close and good stock is getting scarce and is held at higher prices. Tomatoes are in abundant supply and prices are more or less demoralized. Merced tomatoes are now quoted at little more than half the prices given a week ago. Los Angeles lugs are no longer quoted; but River lugs are placed at from 75 cents to $1. Eggplant is now more plentiful and is now quoted by the box. Green corn is plentiful and is offering at lower prices. Very little okra is to be had. String beans and celery are lower for the poorer grades but unchanged for the best.

(Wholesale prices, San Francisco.)

String Beans, lb	1½ @ 4 c
Lima Beans	5 @ 8 c
Celery, So., doz.	.50 @ 75 c
Lettuce, crate	.50 @ 1.00
Asparagus, box	1.00 @ 1.50
Peas, sack	1.00 @ 2.00
Peppers, bell, lb	4 @ 6 c
Tomatoes, crate, Merced	.30 @ 40 c
River lugs	.75 @ 1.00
Rhubarb, box	.50 @ 65c
Cucumbers, lug	75 @ 1.00
Eggplant, lb	50 @ 75 c
Summer Squash, lug	.20 @ 50c
Green Corn, sack	75 @ 1.25
Okra, crate	.75 @ 1.25

POTATOES AND ONIONS.

The potato market is weak this week, with very few encouraging features as to better prices. Oklahoma potatoes are now being shipped westward, crowding California stock in the Southwest. In this market supplies are ample. The onion market has also weakened during the week, with red onions selling as low as 50 cents per sack. Garlic is unchanged.

New River Potatoes, ctl.	.50 @ 90c
Onions, yellow, sk	.60 @ 70c
Red, sk	.50 @ 60c
Bermudas, crate	.85 @ 90c
Garlic, per lb. new	5 @ 6c

POULTRY.

Receipts of California stock are a little more plentiful this week and the receipts of eastern are keeping up right along. The demand, however, is also mending a little and prices are kept at just about the old level. Broilers are a little firmer, as is young stock generally.

(Wholesale Prices, San Francisco)

Live Turkeys, lb	.15 @ 17 c
Broilers	.21 @ 23 c
Fryers	.21 @ 23 c
Hens, extra, per lb	.16 @ 17 c
Small Hens, per lb	.13 @ 14 c
Smooth Young Roosters, per lb.	.24 @ 27 c
Squabs, per doz	$2.00 @ 3.50
Geese, per pair	2.00 @ 2.50
Ducks, young, lb	.13 @ 14 c
Old	12 @ 13 c
Belgian Hares	7 @ 8 c

BUTTER.

Although arrivals have been fairly heavy during the week, the sales have kept the market fairly clean, and the price has moved up half a cent. The increased poulation due to the Exposition is believed to be materially affecting the consumptive demand here.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	26½	26½	27	27	27	27
Prime Firsts	25½	25½	25½	25½	25½	25½

EGGS.

The egg market is up half a cent for extras and a cent for selected pullets, with a generally firm tone maintained throughout the week. The demand has been a little more active during the last few days.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25	25	25	25	25½	25½
Firsts	21½	21½	21½	21½	21½	21½
Sel. Pul.	23	23	23	23½	24	24

CHEESE.

Fancy flats, which last week registered an advance after a long period of steadiness, have again gone up half a cent.

S. F. Dairy Exchange prices on flats and Y. A.'S)

DECIDUOUS FRUITS.

The season for Loganberries is now about over. The black variety is no longer quoted; and the red is very scarce, being quoted at from $5 to $6. Currants are also practically out of the market. Gravenstein apples are more plentiful and are quoted at $1.25 to $1.75 for four-tier boxes, with about 35c. off for 4½ tier. The market is pretty well overloaded with cantaloupes, which are selling at a big reduction from the prices named a few days ago. Watermelons are also coming in freely. They are down a little for the best goods; but the market is in pretty fair shape nevertheless. Large quantities of plums have arrived; and the price is dropping right along. Seedless grapes are in good supply; but the demand is also good and the market is well maintained.

Loganberries, red	5.00 @ 6.00
Strawberries, chest	3.00 @ 5.00
Raspberries, chest	4.50 @ 7.00
Blackberries, chest	3.00 @ 4.00
Plums, crate	35 @ 65 c
Figs, box	1.25 @ 1.50
Apricots, crate	.50 @ 60 c
Lug	.65 @ 85 c
Pears, Bartlett, box	1.00 @ 1.75
Other varieties	.75 @ 1.25
Peaches, crate	.55 @ 80 c
Small box	.40 @ 55 c
Lugs	75 @ 1.00
Apples, new Red Astrachan, box	$1.00 @ 1.35
Apples, Gravenstein	1.25 @ 1.75
Cantaloupes, crate	50 @ 1.25
Watermelons, lb	½ @ 1¼ c
Grapes, crate, Thompson Seedless	1.25 @ 1.75
Malaga	1.50 @ 1.75

DRIED FRUITS.

A lot of interest is being given to the dried fruit situation, but nobody seems able to guess as to the future. It looks as though the poor demand for fruits for canning is certain to throw a lot of fruit into the hands of the dryers. The general talk is or low prices all along the line. A large lot of new crop dried peaches was bought by a local packer this week at 2½ cents, though probably not much is changing hands at that figure. Apricots are offering freely here, most of the transactions being at about 6 cents. Some sales at 8 cents are reported, but the general orchard run appears to be going at 6 cents. The New York Journal of Commerce says of the eastern market:

"Practically no dealing is being done by the trade here on the basis of the advanced prices which have been announced by the packers for September-October shipments of prunes from the Coast. This market is said to be well protected for supplies to satisfy its early fall needs. Contracts have already been confirmed and the factors feel that they are in a position to sit back and wait for developments in the controversy which has arisen between the packers and the growers. Jobbers are stocked with sufficient supplies to meet demands until the middle of October and every one here appears

to be confident that by that time something definite in the situation will have occurred.

"It is freely predicted here that the conditions which now exist in the future prune market are only temporary. The season is only beginning and the growers have not yet begun to dry their crops. The packers having sold short without covering are approaching the time when they will have to secure supplies to meet their contracts. In order to make up any possible loss they may sustain they have advanced the prices on all sizes for Santa Clara prunes for September-October shipment. On the other hand, the operators believe that when the crop has been dried and is ready for the market the growers will be forced by the pinch for ready money to accept the prices which are offered by the packers. It is thought that it will be an impossibility for the growers to hold on to their crop once it is ready to ship, as they must be depending on their sales for money for fall needs. As far as this market is concerned the present situation is attracting only a minor attention. Being safely intrenched against all demands until the middle of October they are devoting their attention to the spot market, which is very strong now, with steady buying.

"Europe is said to have been a heavy buyer for future prunes. Most of the sales have already been confirmed at the prices which prevailed in late May and early June, and if such is the case this trading should not have much effect on the existing prices.

"A very strong feeling still persists in prunes on the New York spot market. Buying is steady, and prices are firm, with a slightly upward tendency. The European business which was such a prominent feature last week appears to have diminished to some extent during the first part of this week. One reason which has been assigned for this falling off in sales to the English market is the lack of available supplies. Inquiries are still coming in, however, and shipments are said to be prepared for the latter part of this month."

(Prices to Growers.)

CITRUS FRUITS.

The hot weather in the east has helped the lemon situation, and while prices on citrus auctions are still too low, it is hoped that the balance of the season will show paying bids. On the New York auction, Monday, July 19th, valencia oranges averaged from $2.85 to $4.50 per box; navels $1.45 to $2.05; lemons $1.25 to $2.55. The same day at Cleveland, lemons averaged from $1.70 to $3 per box. Shipments of citrus fruits from southern California are averaging about 50 cars daily. Total shipments to July 18th this season were of oranges 29,783 and of lemons 5,010 boxes.

Citrus fruits have not attracted a great deal of attention this week, owing probably to the increasing variety of deciduous fruits offering. Prices are as before.

(Wholesale Prices, San Francisco.)

Oranges, Valencias, bx.	$2.75@3.50
Grapefruit, seedless, box	2.00@2.25
Fancy	2.50@3.00
Lemons, box	1.50@3.50

NUTS.

The market was given a little shock when an inquiry came in for a car of almonds; but as there have been no stocks in first hands for a long time, this was of little interest to the grower. Everybody is now waiting for the 1915 crops.

(Prices f. o. b. San Francisco.)

Almonds, 1915 crop:

Ungraded	8 @10 c
Manchurian	6 @11 c

HONEY.

A lot of comb honey is now coming into the market more, it is said, than was the case last year, and a considerable portion is of the better grades. Water white comb is down a cent from the top quotation; and water white etxracted is down half a cent, though no great quantity of the latter has yet come in and the trade anticipates that it may advance again soon. The light amber grades of both comb and extracted are well maintained. There is no call whatever for dark.

Water White, comb	10 @14 c
Light Amber	8 @10 c
Water White, extracted	5½ @ 6½c
Light Amber	3½ @ 4½c
Dark	2 @ 3 c

LIVE STOCK.

Light and medium calves have declined, as have all grades of hogs. Dressed meats show no changes, and the market is reported firm.

SPECIAL DECIDUOUS MARKET REPORTS.

By J. L. Nagle.

Sacramento, Cal., July 19, 1915.

A general lowering of prices has prevailed in nearly all markets during the past week, with little or no demand for any variety except Blue Plums and Bartlett Pears.

Shipments of peaches from eastern fruit districts are increasing and Texas and Georgia are now averaging from 100 to 150 cars of peaches a day.

Furthermore, the Eastern weather has not been favorable to the consumption of fruits, and with the supply from all districts practically in excess of the demand, fruit as a whole has sold at prices lower than the cost of production.

An unfortunate situation is this, that California Elbertas being two weeks late will come into competition with the height of the Eastern fruit season and we anticipate still lower prices than at present prevail. Our only salvation lies in the fact that probably the quality of the eastern fruits will affect the demand, and as California Elbertas are of exceptional quality this season, they may be given the preference. Elbertas from the lower San Joaquin Valley are now moving, but the Placer county Elbertas will not be at their height until the first of August.

Reports from New York indicate that the shipments of Almeria grapes will be at least 50 per cent lighter than last season and as mildew has developed in the Tokay district of the San Joaquin Valley, which will unquestionably reduce the California grape tonnage, we look for a ready market for both Malagas and Tokays. Malagas from the Imperial and Coachella valleys are now moving and the quality is better than for several years. The first few cars that have arrived in the East have found a ready market at satisfactory prices. What few Thompson Seedless have been sold were undersized and not up to the sugar test, but, being practically the first grapes on the market, sold well.

Unless something unforeseen happens, Michigan will have a full crop of peaches. This condition prevails also in Connecticut but it is reported that Michigan and New York will both be light on grapes and quite a tonnage has already been sold to the juice factories.

The following prices have ruled for the week:

New York—Bartlett Pears averaged $2.73; Comet Pears, H. B., $1.25; Wilder Pears, H. B., $1.50; Tragedy Plums, $1.12; Burbank Plums, 92c; Climax Plums, 70c; Wickson Plums, $1.39; Santa Rosa Plums, 94c; Hiniori Plums, $1.15; Oregon Cherries, 80c; Republican Cherries, 98c; Royal Anne Cherries, $1.07; St. John Peaches, 50c; Triumph Peaches, 50c; Hale Peaches, 50c.

Chicago — Climax Plums, 78c; Santa Rosa Plums, 93c; Tragedy Plums, $1.25; Burbank Plums, 78c; Boton Plums, 65c; Ogon Plums, 75c; Wickson Plums, $1.04; Oregon Cherries, 95c; Bartlett Pears, $2.30; Malaga Grapes, $3.37½; Hale Peaches, 40c: Triumph Peaches, 45c; St. John Peaches, 63c.

Minneapolis — Triumph Peaches, 70c; Hale Peaches, 55c; Climax Plums, 75c; Burbank Plums, 92c; Santa Rosa Plums, $1.15; Tragedy Plums, $1.55; Wickson Plums, 75c; Bartlett Pears, $2.77.

Total shipments to date, 2838; total shipments same date 1914, 3511 cars.

Publisher's Dept.

"Poultry Diseases and Their Treatment," by E. J. Wortley, is a new book just received. The aim of the author has been, in a concise way, to tell the poultry-raiser how to determine various diseases and take the necesary precautionary steps in preventing the introduction and spread of contagion. The book contains 125 pages, is cloth bound and sells for 75 cents per copy. Orange Judd Co., publishers, 315 Fourth Ave., New York.

Dr. J. E. Coit of the University of California has prepared an excellent manual on "Citrus Fruits: an account of the Citrus Fruit Industry with special reference to California requirements and practices and similar conditions"—just published by the MacMillan Company. Dr. Coit has made a close study of the growing of citrus fruits in this state ever since he came to the staff of the State University nearly a decade ago. His book is an able and orderly statement of the latest troubles in citrus culture which have been demonstrated by practical experience and by scientific research; in both these lines he has done creditable original work. The book treats pointedly and concretely of the history of California citrus growing, the climatic requirements of these fruits, their botany and growth habits, the desirable varieties and their propagation, planting, pruning, cultivation, fertilization and irrigation. It has a fine review of frost effects and their prevention; California methods of picking, packing and marketing and a very careful and explicit review of pests and diseases and the latest phases of the warfare against them. A very full bibliography of the publications by other writers on citrus fruits is also given. The book is excellently adapted for use in high schools and colleges and should also be in the hands of all practical growers. The volume has 520 pages, 12mo, and is very fully and excellently illustrated. Price $2 per copy.

This is the dull season for advertising with farm journals everywhere, and the Rural Press is no exception. However, those of our patrons who continue their announcements through the summer season will without doubt get their money back in increased sales. While farmers may not answer ads as freely during the busy season as in the fall and winter, yet they do read, and when they market their crops they will naturally buy from the firm whose product is familiar to them.

On account of heavy shipments of livestock from Humboldt county on the N. W. P. R. R., the company has set aside Thursday as stock shipping day; and only on that day can shipments of stock be made.

Those who attend the meeting of the American Poultry Association can not only take part in that Convention, but can exhibit at and attend the Panama-Pacific Poultry Show and can see the world's greatest International Expositon.

Twelve Foot Corn in a Desert

Hundreds of farmers are growing splendid crops where hardly a blade of grass grew before. *You* also can secure richer crops and increase your profits correspondingly.

G-E ELECTRIC MOTORS FOR RANCH AND FARM

will run the season through without attention.

A G-E Motor will do the work of six men at less cost than the wages of one. Its first cost is less than one-third that of a good horse and it will do more than eight times the work in a day, owing to its continuous operation.

Read the results your neighbors are getting.

The Price of Progress

THE Panama Canal stands as one of the most marvelous achievements of the age. Into its construction went not only the highest engineering skill, but the best business brains of the nation, backed by hundreds of millions of dollars.

Suppose conditions not to be foreseen made it necessary to replace the present canal with a new and larger waterway of the sea-level type, to be built in the next ten years.

Also suppose that this new canal would be the means of a great saving in time and money to the canal-using public, because of the rapid progress in canal engineering.

This sounds improbable; yet it illustrates exactly what has happened in the development of the telephone, and what will certainly happen again.

Increasing demands upon the telephone system, calling for more extended and better service, force removal of every part of the pla not equal to these demands. Switch boards, cables, wires and the tel phone instrument itself were chang time and again, as fast as the a vancing art of the telephone cou improve them.

It was practical to do all th because it greatly increased t capacity of the plant, reduced ser ice rates and added subscribers t the hundred thousand.

In ten years, the telephone pla of the Bell System has been rebu and renewed, piece by piece, at a expense exceeding the cost of t Canal.

Thus the Bell System is kept the highest point of efficiency, alwa apace with the telephone requir ments of the public. And t usefulness of the telephone has be extended to all the people.

Cover Crops for Permanent Fertility.

There is a conviction among California Fruit Growers that abundance of humus in the soil is an important factor in crop production—that cover crops must furnish the major portion of said humus.

[Written for Pacific Rural Press by William M. Bristol, Highland.]

There was something akin to a riot a few years ago when a gentleman connected with the U. S. Dept. of Agr. made the statement that, in the history of the world, no region dependent upon irrigation had been permanently prosperous. "Important, if true," was the comment. Granting the assertion to be at least partially true, the Californian of today finds himself wondering if the unfortunate ancient irrigationists knew anything about cover crops and humus.

Although all orchardists are apparently agreed upon the value of cover crops, there is yet some difference of opinion concerning varieties and methods of handling.

Many Cover Crops Tried.—Since the cover crop idea become popular in California, there has been an interesting procession of candidates for the office of soil rejuvenator. The whilom American partiality for foreign goods extended even into the rural field, and the Canadian pea was the first plant to find favor among the fruit growers. Close on its heels came the common vetch; and because of its hardiness, it soon superseded the pea. Along with these two distinguished legumes came a whole troop of modest relatives, until it seemed that every plant whose seed was a bean or a pea was a candidate for the position. Lupines in assortment, fenugreek, beans of the horse variety, peas of the cow variety, and other aspirants joined the ranks until the orchardists were reminded of those lines from Pinafore, which run—

"His sisters and his cousins,
Whom he reckons by the dozens—
His sisters and his cousins and his aunts."

Recently buckwheat, which certainly is not a legume, has been extensively tried as a summer cover crop. It is not recorded that anyone has planted maple trees amid the buckwheat.

From parts unknown, there has also come an unbidden and unwelcome intruder in the form of a small nettle. Like the Japanese in America it flourishes in either sunshine or shadow; and bases its right to be here on the fact that it can thrive where the other candidates find the sledding difficult.

Sweet Clovers for Summer and Winter.—Just now the Melilotus—sweet clovers—are marching well to the fore in popular favor, two varieties having entered the lists. Of these two, Melilotus indica, the yellow-flowered, winter-growing annual, is the better known. At the Riverside citrus experiment station, until distanced by purple vetch, it gave the best results, as indicated by the crops which followed it, of all cover crop plants so far tried. It is not generally diffused in California, because, perhaps, of the fact that it blooms rather late and consequently, when it has appeared in the orchards, it has been plowed under before ripening its seed. It is not relished by stock and, when eaten, it imparts a flavor to dairy products that is not relished by man.

Melilotus alba, the white flowered, summer-growing biennial, is not a stranger in California, for it has cropped out widely in alfalfa fields, but it comes now with flattering testimonials, both as a summer cover crop and as a hay and feed plant. Certain it is that in two small orchard plots in Highland last summer it made a luxuriant growth, sending down roots so long and strong that, although not started until May, they could not be pulled by hand in November.

Upper.—Scene in an 8-year orange orchard. The man, who is over 6 feet in height, is meditating on the magnitude of his crop of Melilotus indica and wild oats. No, he did not sow the wild oats, neither will he reap them, but will plow them under along with the clover—and they shall be counted to him for humus.

Lower—Melilotus alba in 15-year-old orchard. The stalk the two men are holding between them reaches to the top of the picture and is taller than both of them. View made in June, 13 months after planting. At this time, July 15, owner has decided to plow it under but may first have to cut it into stove lengths.

With the feeling that the annual cover crops, plowed under before maturity, do not accomplish what is desired, there has been some experimenting with alfalfa in the effort to get deep and effective perforation of the plowsole. Although not systematic and exhaustive, these experiments have promised well, the greatest objection to alfalfa being the difficulty of plowing it under when desired; for it is conceded that, whatever the cover crop and whether it be allowed to grow six months or two years, the end sought is only gained by its ultimate destruction and decomposition. Experiments with Melilotus alba so far made indicate that it will make a larger growth the first year than alfalfa; and as it dies a natural death the second fall, it is plain that the grub-hoe need not be used after the plow, as is the case with alfalfa.

Sweet Clover Subsoiler.—Not many years ago it seemed that a subsoiling implement, drawn by several horses or by a tractor, might come into general use in overcoming plowsole in the orchards. The results gained by this method, however, are not commensurate with its cost; and there is a widespread feeling that some deep-rooting plant, performing the double service of soil-perforator and humus maker, must prove preferable; especially as the latter works, no mechanical injury to the tree roots. At this moment, when many orchardists were seriously contemplating subsoiling by means of alfalfa, melilotus alba comes on

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau, at San Francisco, for the week ending at p. m., July 27, 1915.

STATIONS	Rainfall Data: Week Past	To Date Seasonal	to Date Normal	Temperature Data: Max'm	Min'm
Eureka	0	.20	.11	62	52
Red Bluff	0	0	0	108	64
Sacramento	0	0	0	102	56
San Francisco	0	.01	.01	72	52
San Jose	0	0	0	92	54
Fresno	0	0	0	108	62
Independence	0	0	0	98	
San Luis Obispo	0	.01	.01	86	52
Los Angeles	0	0	0	88	62
San Diego	0	0	0	82	62

THE WEEK

More than nine millions of people have twirled the turnstiles of the Panama-Pacific Exposition and the better half of the time for their coming still remains. Visitors from a distance are now coming in masses, as it is the outing season east of the Rockies, and August in San Francisco will give them bracing coolness which they cannot find in their owu areas—not even on eastern mountain tops. When these eastern multitudes shall have been refreshed and edified they will return to their homes the better fitted for the duties of their reputed strenuous lives. In the autumn, when, as Californians know, open-air life in San Francisco is most delicious and entrancing, the inhabitants of our own and adjacent states will largely take possession of the Exposition. Even those who have already sighted it will be likely to return for longer sojourns in the bay region. The harvests will then have been gathered and the various other activities connected therewith, which engage all classes of our population, will be lessened. It will be the westerners' delight to do the fair in the autumn and gain from it recreation, instruction and patriotic incentive and confidence. For all the great world-seers agree that the affair is most notable and therefore worth paying heed to. Last week ex-President Roosevelt was the star-observer, and, notwithstanding his famous reticence about saying what he thinks, he could not restrain these very forceful words: "California has emphatically made good. She has built, without a dollar of governmental assistance, an exposition of which every American citizen should be proud. Though my expectations were high the reality has surpassed them. Not only is this exposition worth seeing, but it is worth making a saerifice to see. Every American citizen who can possibly do so should visit the exposition, and the fathers and mothers should bring the children. They will find much that it will be of the utmost pleasure and profit to see. I have seen many expositions, but none both so interesting and so beautiful."

The autumn will also be a most delightful season to visit Southern California and the San Diego Exposition should also be thronged. The occasions at San Francisco and San Diego invite all who can to turn a circle of the State and thus attain more adequate idea of the greatness and variety of California, which one who tarries in a single part of it can never possess.

We are Rattled on Spots.

We have heard that it is a good time to stop playing when the spots in your hand begin to run together and become hard to count, but we desire to be exactly fair with the proposition of sunspots as weather prophets and have to keep at them, although we must acknowledge we are becoming a little confused. For there came from St. Louis by telegraph last week this announcement: "At the Christian Brothers College on Sunday one hundred and fifty spots were seen by Brother Hubert, thirty-three more than were visible on Friday and Saturday. Records kept at the college and covering several months indicate that every unusual weather disturbance has been followed by great sun-spot activity and that a waning of the sunspots has been followed by clear weather." Our confusion comes from the declaration in the last sentence that, in the first part of it, the weather is said to be antecedent to the spots and, therefore, possibly the cause of them; and, in the latter part, the spots are said to be antecedent to the weather, and therefore, possibly, the cause of it. The only philosophy we can think of for comfort is that "it is a poor rule which does not work both ways" and the result of that would be either that the spots and the weather mutually cause each other or that it is sometimes one, sometimes t'other.

Nor do we get more definite impression from other preachers on the subject, so far. Professor Nicholson is credited with saying to his students at the Summer Session of the University of California: "The spots have none of the miraculous power attributed to them by popular repute. The only known influence that the sun-spots exert is connected with electrical disturbances. If a graph were made of the maximum periods of sun-spots and the maximum severity of electrical storms, the two would coincide." We do not know what the Professor intends to indicate as "miraculous power" and therefore cannot tell what potency he desires to deny them, but the second part of his utterance seems to endorse the spots as meteorological factors—providing storms are electrical phenomena, and that we cannot either affirm or deny. We are confused: we may have to "take water" on spots and that is just what is claimed for them.

What is Farming?

The neo-Platonists, who are very busy nowadays putting forth philosophies of farming, surely threaten us with a brain-storm. They all seem to be trying to develop the idea that farming is not like other vocations of men: it is a sort of a shell in which the farmer should curl up out of contact with other callings of men, leaving only a small aperture through which beneficent people could pour into him such physical and mental food as they think he ought to have, to the end that he grow big enough to fill the shell and no more. It is a crazy notion and we have had to exclaim against it before. After we had sat two or three days blinking at the corruscations of the Dublin school of idealists in 1913 we had to protest somewhat vehemently against their main contention: that "farming was not a business so much as a mode of life" and therefore farmers ought to be belabored until they could see that they ought to cherish views of life which did not appertain to other people. This appeals to us as sublimated nonsense. For his mode of life the farmer should have the same things which make other men decent and efficient, viz.: a clean bed and bathtub; plenty of good sleep and good food; a chance to do good thinking; a good readiug-light and the Pacific Rural Press always within reach from his rest-chair. He needs all these things to make him good in his business, and the more energetically he pursues this business, the more fully he applies what common human experience demonstrates to be good business principles, and the more he pushes his business up against the business of other people and insists upon doing it himself when other people will not handle it fairly for him, the nearer he will come to functioning as a farmer true to his high calling.

Isolation of Farmers.

These kindly people who honestly desire to help the farmer by giving him a better chance to grub dirt, away from the madding crowd of merchants, professional men and politicians, do not seem to see that they would intensify the disadvantage under which he has always labored, to wit: isolation. And the saddest thing about it is that they really seem to be doing it unconsciously and unintentionally and with the enthusiasm of philanthropists. They, of course, do not realize that the more they make the farmer dependent upon others, from the government down to the country store-keeper, the more they handicap him as a successful and efficient producer, except the few who get between him and them, for their own purposes. The most insidious way to do this is to convince all the people, including farmers themselves, that farming is a mode of life apart from the modes and methods of other people's lives, and therefore he should not expect to enter into the views and activities by which other citizens advance their own interests and serve their countries. It is perhaps not surprising that such a conception of the farmer's civic relation should be advocated in Europe, where most farmers have so recently emerged from different degrees of serfdom, but the view is certainly untrue and abhorrent when applied to the American farmer. The American farmer has all the civic endowment, rights, duties and opportunities which those in any other vocations have; and his more abundant future is to be attained, not by isolation and the assertion of differences, but by competitive association, in which all citizens should strive for individual and national efficiency and prosperity. For both these desirable ends farmers should come out and go forward in public affairs, in commercial affairs and in social affairs more intelligently and energetically than they have hitherto—and they should train their young people, not for some indefinite and undefinable mode of life, which the idealists are proposing as "agricultural," but for the free, open, public life of American citizenship.

What They Say Farming Is.

We have to admit that we are tilting against windmills, for we cannot understand just what those who would unseat the farmer from the saddle of common American citizenship really mean by the fine phrases they are using. We will not say that they do not themselves know what they mean, but we confidently suspect it. Take, for example, this profound piece of analysis which we find in the California Outlook:

"Amid all the attributes of God that men dispute about, there is but one that all philosophies agree upon, that of Creator. Man, made in the image of God, finds that in himself his nearest resemblance to deity lies in his creative powers. To a few there is given the divine spark of invention, the creative imagination, the faculty of grasping the fruitful need, the force of character to make mind and opportunity co-operate to obtain a finished product. The farmer is the one man in whom all these qualities are demanded daily. So of course farming is not merely a science, though science helps. It is not alone an art, though the perfection of its art saves labor and adorns the result. It is a point of view, and one that should not be missed by any one who wishes to include in his career the abundance of life."

We had always supposed that man could reach nearest semblance to God by being just and good. If all philosophics agree that man most resembles God by his creative ability, they must be off their base, for man's creative power has wrought some of the most devilish things the world has ever experienced—the present war in Europe, for instance. But to follow that, might bring us up against the question of why God made the devil. This we positively refuses to discuss: we don't know a thing about it.

According to our notion of it, the writer of the lines we quote above is right in saying that farming is neither wholly a science nor an art, but includes both. Why then did he not continue along the same line and say that farming is not a point of view but needs to include one, and the reason why the farmer does not count for more in the community is because he has no clear idea of his rights and relations, and has never valiantly contended for them among other callings of men. A farmer may have a point of view sharp as a needle, but so long as he keeps it inside his own head or heart, it does him no more good than a stomach-ache.

The Use of a Point of View.

There is, of course, an "agricultural point of view," and it is important to hold and enforce it whenever conditions demand, but the point of view is no more the whole of farming than the lawyer's point of view, as to his fee, includes the squeeze of the rope on the murderer's neck nor than the doctor's point of view as to his bill includes the exultation of the patient who eats his first square meal without an appendix. Points of view are essential to farming as to lawyering, doctoring, store-keeping, banking and cobbling, but a point of view is of no account, except perhaps in poetizing, unless you can get out and drive it into people. Even then the point of view is not the vocation of a man; it is only to guide him in his doings with men. Therefore, though his point of view, as to what he should have and what he should do, is an indispensable element in the equipment of a farmer, his attitude toward the enforcement of it, upon public attention and upon individual acceptance and respect, is exactly the same as capable people in other callings should have, and generally do have in greater measure than food-producers do. It is, then, the farmer's attitude toward his point of view which is the real thing in this contention. Unless he gets out into the forum of citizenship and enforces his point of view more systematically and vigorously than he has in the past, he may expect all kinds of doctrinaires to keep on prescribing rest-cures for his feeble-mindedness.

Clean Speed Contests.

It is quite possible that the Panama-Pacific Exposition racing contests may leave us a legacy of clean racing which will be a joy to sportsmanship and an advantage to the horse breeding of the State. California has a rich history in speed-breeding and training, and her natural adaptations to the breeding and development are known to all horsemen. Unfortunately racing fell into an abomination of destructive gambling and many coarser vices which the people could not endure and valiantly crushed out. Such things cannot and should not ever be tolerated again, and the people will have no patience with them. But racing on high moral and sportsmanlike grounds and decent environment is quite a different thing of course, and is commendable as an adjunct of breeding and as a clean pastime. It is currently reported that about a score of well-known amateur turfmen intend to organize for the right kind of speed contests, and if they will keep themselves clear from the old race-track promoters and retainers and give the public something good and clean, as may be possible under existing laws against race-track vices, it will be an effort toward the development of one of the State's resources and interests which fell into very bad company, and has properly suffered for it. We shall watch the undertaking with much interest.

Queries and Replies.

Querists must give name and address.

Root-Knot.

To the Editor: I have a fine large satsuma plum tree five years old which is beginning to wither. On investigation I find the roots are all gnarled up and seem to be growing solid. Is there a remedy and what is it, and can the trouble be prevented from spreading to other trees?—G. B. McL., Los Angeles.

We take it to be a bad case of root-knot. Dig up and burn all the roots you can get in the hole where the tree stood, using some dry fuel to bake the ground well. Next winter dig out a large hole, fill with new earth and plant a new tree. It is too far gone for curative treatment.

Walnut Blight and Aphis.

To the Editor: What has caused the black spots on the walnuts I send, and can anything be done for preventing it in the future? There are also some green lice on the back of the leaves. Is there any danger that they may increase to any great extent this summer?—H. E. L., Biggs.

The black spots resemble spots of the walnut blight, but they affect only the epidermis and are cracking and peeling. We are not sure of the cause. They are not behaving in the usual walnut-blight way and no injury need be apprehended from them. A blight spot usually shows blackening and destruction of the hull-tissue to the shell and into the nut. If these are blight, some natural condition has arrested their development. You have not aphis enough to hurt so late in the season as this, for they will be kept down by their enemies or by hot winds. Look for them earlier next season, and if they appear spray early with an emulsion or tobacco insecticide.

Unloading Sin on the Climate!

To the Editor: I live near the north shore of San Francisco bay and have six acres apple orchard and five acres to crop and garden. Conditions are peculiar here and trying. Every afternoon during the summer we get a westerly trade wind that blows anywhere from 10 miles to 25 miles per hour, and continues well into the night. During June we had temperatures ranging from 90 degrees at noon to 50 degrees at 8 p. m., accompanied by a cold fog. This extreme in 24 hours seems to check all plant growth. Peas bloom when 6 inches high; beans remain stationary at 12 inches; corn makes little growth and turns yellow. Squash, vine, etc., are thrashed to pieces by the wind and all stuff grows so slowly it seems tough and tasteless. What crops can one grow under conditions of this sort? Grain is out of the question as the land in this valley has been cropped to death for years and nothing returned to the land. Possibly the only answer is, "Sell out," but I hope to get some hopeful suggestions from you.—Beginner, Marin county.

You are blaming the climate too much. Your land needs trenching (or at least deep plowing) and a heavy bombardment with stable manure. This would feed the plants and hold more moisture for them. Your land must be made more loamy—whether it be now either too sandy or too hard, and plenty of organic matter will help it in either care. Your working last winter was too shallow or too late so that much rainfall moisture was lost and your planting of all the things you mention was probably too late. The poor growth of plants you describe is caused chiefly by drying out and not by the temperature. With manure and better tillage the corn will grow high enough to wind-break the squashes and other tender foliage. Get manure, save moisture by better tillage, get more busy and get busy earlier in the rainy season. There is nothing the matter with your climate; it is like that which prevails on the lower lands in most northern coast valleys, and it will make a whale of a crop if the soil is fed and worked right.

Apricot Rot.

To the Editor: I am sending you apricots which decay on one side before the other side is ripe. They are of the Blenheim variety, and when not attacked by this disease are deliciously rich and sweet. The samples sent are characteristic in appearance. Please tell me how the trouble may be overcome.—A. M., Oakland.

The apricots have "brown rot," which is unusually prevalent in some parts of the State this spring, because of the cool, moist air prevailing. Pick off all the affected fruit; do not allow it to remain and dry on the tree, for this carries over the germs in abundance and kills the twigs also. The tree can be cleaned by spraying with Bordeaux mixture before the blossoms open next winter. Under ordinary spring and early summer conditions, however, this fungus does not cause much trouble.

Cherries on Plum.

To the Editor: I have fifty plum trees, and the fruit is not salable around here. I would like to know if I could graft English Morello Cherries on plum.—J. C. S., Ontario.

We never saw it done and have no record of such a graft in the experience of older countries.

General Rules for Prune Drying.

[Written for Pacific Rural Press by J. J. Fox, Napa.]

So many questions are asked regarding the proper curing of prunes by men who are new to the business or whose young orchards are just beginning to bear that this seems a timely season for again publishing the method to be pursued.

The first question asked is as to the amount of lye to be used in the mixture. This depends upon the quality of the lye and softness of the water, but broadly speaking 4 pounds to the 100 gallons where pricker sheet is used or 1 pound of lye to 20 gallons of water in basket dipping is about the right thing for French and Sugar prunes. As the water in the dipping tank evaporates more is added, also more lye, and here is where the operator must be watchful. For the lye does not disappear so fast as the water, and if too much is added the mixture becomes too strong—more so than is necessary and the skin of the prune is broken and its quality impaired. It is, therefore, necessary for the operator to watch his fruit as it comes from the dipper and when the skin is slightly lined, but full and not easily broken, the necessary result has been obtained.

The purpose of dipping the prune is that the waterproof bloom shall be taken off and the fruit put in the best possible condition for drying quickly. To do this they are dipped in the boiling lye mixture for about 2 seconds and immediately conveyed to the trays, though some growers immerse them in cold water after the lye dip. This operation adds very little to the cost where dipping is being carried out by the old-fashioned basket method.

Now, if the dipping mixture is not kept at boiling point the best results are not obtained and without a tubular boiler this is not easy to manage as a box of cold prunes is going into the liquid every few seconds and then the inexperienced operator keeps his prunes in twice as long as he ought so as to make up for the lack of heat. If kept in too long or in a mixture too strong, at the first swipe of the paddle in the spreader's hands a lot of prunes are skinned or abraded and these will flatten out and be put in the discard by the grading machine. Anything that spoils the grade one point is $1.00 a ton loss to the grower where he sells on a flat basis.

In dipping Imperial prunes, a very weak solution is needed as the skin is so thin and tender. In fact, a good many growers use boiling water only and with good results. The Imperial prune must be gathered every other day to avoid sunburn and the consequent browning of the meat just under the skin.

The Robe de Sargent can be dipped in a medium solution, but is much tougher skinned than the Imperial and when properly dried is a handsome black shining fruit, sometimes appearing to have been processed.

When prunes are about half dry and the season is not too late, both quality and weight can be improved by stacking the trays after having moved all the fruit. To do this one must have plenty of trays, and it is not common for the prune grower to provide more than he needs. He generally figures to fill them at least twice.

It is so much easier to demonstrate than to describe the operation of drying prunes as it should be done that I fear this article is rather discursive, but it can be summarized by the following rules:

1. French and Sugar prunes and the new Standard can be dipped for 2 seconds in boiling lye 1 pound to 20 gallons water.

2. Watch the dipped fruit and if "overdipped," add a few gallons of water or be more prompt in taking them out. If they do not wrinkle at all when they come out, add a little more lye.

3. Always endeavor to keep the water at boiling point.

4. Robes de Sargent can be dipped in the same solution if promptly laid out, but will dry well at half this strength.

5. Imperials can be dipped in boiling water only or in a very weak solution or they will crack and stick to the tray too much and may be injured on turning.

6. All prunes should be put 2 trays to 1 (i. e., doubled up) when half dry or else stacked.

7. They must be boxed before they are so dry they will rattle and yet must not be so soft they will lose shape readily on squeezing.

In short, the handling of the prune crop is a matter of judgment. Both weight and quality are gained by an intelligent and efficient operator.

Napa Co. Horticultural Com'r.

WATERING MAKES LATE PEARS.

[Written for Pacific Rural Press.]

Jack McAlister of Santa Clara county got nearly double the price for his pears last year because he held them back from ripening by timely irrigation. The weather in August and September when the Bartletts and Beurre Hardys ripen is a little too warm to accomplish much by irrigation except to increase the size of the fruit. The Hardys were irrigated two weeks before picking early in September; and after they were picked, the Comice, Winter Nelis, and Easter Beurre were irrigated. The Comice were picked just before the Nelis and the Nelis were three inches in diameter before they needed to be picked late in November. The Easter Beurres six weeks after the Hardys, which brought the picking up to January 1. The Easter Beurres were 3½, 4, and 6 inches in diameter at that time. The pears had been held on the trees at least a month later than other people, and some of them were held in storage until March 1 before shipping to the eastern and coast markets.

The pears are right to pick when they are large enough and the seeds begin to turn brown; but this condition is delayed and the size increased by late irrigation. Mr. McAlister ships under his own label to regular wholesale customers—never to auction.

A prominent grower from another section points out that Bartletts from Santa Clara and Alameda districts almost always bring a lower price than fall and winter varieties because they are soft, watery, good for canning but not for shipping.

Pears for Export.—H. A. Fairbanks of the Producers' Fruit Co. points to the considerable exports of Comice from southern Oregon to Europe, and says the trade may be expanded. He also mentions Geo. Anderson of Santa Clara valley as making a specialty of Comice and Buerre Hardy for export, and believes that section is especially adapted for late pears.

There is quite a district rising from the south end of San Francisco Bay, which has cold, heavy adobe soil, usually not very well drained, in many places overlaid with flood silt as much as four or five feet deep where late pears should do well, where blight is unknown and thrips are scarce.

On the other hand, G. M. Brown and H. Richards prefer the Bartletts which they can ship, dry, or can, all at a profit, while the late pears must be shipped.

Efficiency

An organization along broad and liberal lines for a nation-wide, safe, and sane distribution of tree and vine fruits. Our services are available through our associate members to any and all shippers of fruits.

Peach Budding Under Old Bark.

[Written for Pacific Rural Press.]

Orange clings did not suit C. F. Walker of Fresno County so he had twenty acres of the old trees budded over. Practically all were lost and the trees died. In September (1913) a few of the trees on which the buds had failed to take were rebudded directly into the old thick bark of the main limbs near the crotch by Frank Henry of the same county.

Last winter when these were a little over a year old we saw a number of them which had grown to 1¼ and even 2½ inches in diameter; and had made fine unions.

By making the proper cuts in taking out the top of the old wood, under this system of budding into the old bark, there is no danger of dead wood. That is, instead of cutting square across, make a cut of about 45 degrees down back of the bud. In this way sap is carried all around the scar, causing it to heal over all around.

Well matured buds were taken from limbs ½ to ¾ of an inch in diameter and cut so that the shield would make a 1½ inch circle if flattened out. Vertical and transverse cuts were made into the old bark as usual, and a triangular tongue of the bark ⅛ inch wide at the top and 1½ inches long was taken out along the vertical cut, so as not to close the bud under the bark. The buds were inserted quickly and tied to exclude the air and prevent drying. A little nail was driven where a fine wire could be tied and wound around the limb tightly just above the bud, but below the transverse cut. The light wire is necessary on very heavy bark in order to prevent the old bark from curling up. This wire tends to force the sap into the bud, because it becomes tighter as the limb grows.

Later Pruning Necessary.—Mr. Henry says there should be three buds on each limb to be worked over so it will shade the trunk when the old growth is cut off, and also to help take the sap of the tree. In the second year he would cut out part of the buds. At winter-pruning time, after the buds are inserted, cut off about 50 per cent of the old top, to give the tree a reserve force so as to force the buds out; and during the next spring, cut the limbs back two or three times. The last cut is made in July, since by that time the buds are able to take all the sap.

Budding thus without cutting back gradually but entirely is a waste of time. To cut out all the top of a peach tree at once, back to the trunk is too much of a shock to the root system.

Some buds inserted in various parts of the orchard of other varieties of peaches were neglected in this respect. The limbs were not topped back so the buds did not grow, although they healed into the old bark thoroughly, but they never will start.

SULPHURIC ACID ON ALKALI.

Sulphuric acid treatment of alkali soil by Prof. C. B. Lipman and L. T. Sharp of the University of California promises a revolution in alkali treatment methods. "If our experiments should turn out to be entirely successful, as we now have good reason to think they will, treatment of alkali land [with sulphuric acid] to make it profitable should prove by far the cheapest method of reclamation."

Alkali soils which had been producing practically nothing were brought from a Fresno county field, and equal quantities put into 19 pots. Three of them were not treated and the rest were treated with varying amounts of sulphuric acid and other acids. Pots 1, 2, 3, 4, and 5 are shown in the illustration, the first three having been untreated, the others having been treated with 30.42 grams each of sulphuric acid. Thirteen grains of Beldi barley were planted in each pot and later were thinned to four plants in each. Pots 4 and 5 produced an average of 16.9 grams of tops, 5.4 grams of roots, and .75 gram of grain. They averaged an increased weight of 12.85 grams of tops greater than the plants grown in the untreated soil.

It is especially noteworthy that two other pots, numbers 8 and 9, which were treated with 11.02 grams each of sulphuric acid, had nearly the same yield of tops and roots, while they produced about 3½ times as much grain, so that a smaller amount would seem far preferable.

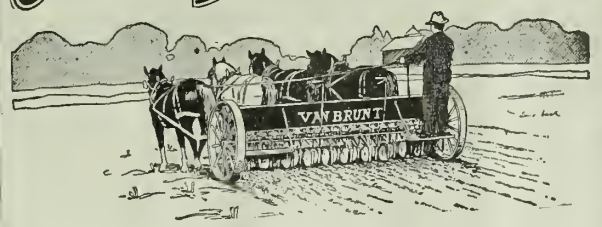
"The sulphuric acid exerted its influence both in neutralizing the sodium carbonate [black alkali] and in improving the soil's physical condition through its shrinkage of colloids .... .experiments ..... have demonstrated the harmful effects on soil colloids of washing out [soil] salts [by drainage] as well as the removal of necessary elements from the soil."

BERRY-CONTAINER WEIGHTS

To the Editor: What is meant, in "Market Quotations," by the terms "Crate" and "Chest" in giving prices on berries?

In contracting to sell blackberries by the ton, what prices would be right in proportion to the prices quoted weekly in your columns?

When picking blackberries for a cannery are they picked in pails, drawers or boxes?—J. I. S., Los Gatos.



[Answered by S. H. Gray, Pacific Rural Press Market Reporter.]

A "crate" of berries generally contains fifteen small baskets, or about 12 pounds net, of berries. The regular berry chest contains 20 drawers, the net weight of fruit varying. The weight of raspberries would be about 50 to 60 pounds; strawberries, 60 to 70 pounds; blackberries, about 65 pounds.

While there would be some relation between the daily fresh-fruit market quotations and contract prices for a crop of berries, it is too vague and uncertain to say that any price on contracts would be right or wrong in proportion to the daily market figures. The latter fluctuate greatly according to the arrivals and needs of the consuming trade from day to day, or even from morning to afternoon. The canneries take the berries loose in the drawers.

Among the features to be shown at the Sebastopol Apple Show to be held August 14 to 22, will be a reproduction of the Liberty Bell in apples.

John Deere Implements

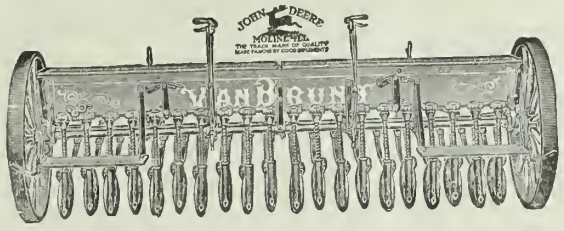
Van Brunt Single Disc Grain Drills

Van Brunt Drills plant any small seed from alfalfa to bearded oats, corn and peas exactly where it will bring the best results—at the bottom of furrows of uniform depth. All the grain is up and ready for harvest at the same time.

No seed is wasted, all the field sown. Van Brunt Drills have an adjustable gate force feed which compels an even, continuous flow of seed from each seed cup without bunching or cracking the seed. It cannot choke up.

The seed is planted at uniform depth. It beats the dirt. Individually adjustable pressure springs can be made to force discs to cut furrows even depth. Seed is conducted from hopper to furrow opener by metal tubes and there protected from dirt until it reaches bottom of furrow.

The "Light Draft Drills"



Van Brunt Drills are so called because they are light weight, well balanced and yet so strong that they work entirely satisfactorily under difficult conditions.

No stub axles are used—none required. Simplified construction makes Van Brunt Drills easier to operate.

Main axles are continuous. Drills are gear driven direct from axle. Each wheel drives half the feeds, insuring smooth running.

Hopper is extra large, well braced and has tight fitting two-piece covers. It does not sag.

Disc bearings guaranteed. They will last lifetime of drill. Disc blades are high grade steel kept absolutely clean by spring steel scrapers.

Grass seeder attachment can be furnished for any Van Brunt Drill. It will sow broadcast or drill, as desired.

Write for free booklet "John Deere-Van Brunt Single Disc Drills." It explains why you will get the biggest yield by using Van Brunt Drills.

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X - 152.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower,

Fruit Growers' Convention Starts Lively.

[Written for Pacific Rural Press.]

Of all production problems, the kind universally presented for solution by farm papers, universities, and convention speakers is the insect, fungus and bacterial diseases and physiological troubles to which fruits and livestock are heir. The free-for-all discussions which followed all papers read at the California Fruit Growers' Convention held at Stanford University up to the hour of writing, were no exception to the rule. The first two days were devoted to horticultural commissioners' problems, mostly bugs and fungi. They were lively meetings, too, in which experiences from all parts of the Western States were related and compared. They were open to all comers. After their second-afternoon meeting the magnificent university art collection was freely opened as a premonition of the remark made by Chancellor David Starr Jordan in formally opening the convention Tuesday evening: "The University is yours. Make yourselves at home here. Go the limit. Just leave it here when you go home." Registration on this opening night reached 125 and an appreciative crowd heard the papers and asked questions of their authors in the discussions following.

During the convention, the committee appointed to perfect a federation of all agricultural organizations in California will meet and get the Federation under way or else disband, leaving the field open for a fruit federation.

The West Coast Potato Assn. held several sessions July 26 and 27 discussing methods of saving the potato industry from the ruin which is enveloping it by reduced yields due to disease and over-persistent cropping.

Notes taken at the commissioners' meeting, and those taken at meetings after July 27, will appear in a more detailed report next week. Following are some of the points made by the speakers of the first session of the regular convention.

Apple Outlook.—The apple outlook for the season just opening is better than for 1914, according to Horticultural Commissioner J. B. Hickman of Monterey county because the American apple crop is 25 per cent less than last year, because we have a standardization law for the first time, by which the quality, variety, and quantity are guaranteed under a State inspection, and because the growers of the greatest producing district have an organization which with proper support may maintain a minimum price to profit the grower. There is a better outlook for dried apples than for fresh, according to Mr. Hickman, so all seconds should be dried and culls ground up, shipping only firsts. California is not an apple consuming State. Its total production would be used were 1 to 1½ boxes per capita consumed by the people of California. The diversified uses of apples should be advertised. Unproductive trees should be removed if not easily remediable and children should be trained in the rural schools to love orchard work.

Pomelo Outlook. — Prof. R. S. Vaile of Riverside deplored the real estate openings advertised for pomelo culture and suggested that great conservation be used in future planting. This was prompted by the fact that Florida's output is expected to double if no more trees are planted, that the trade, the railway service, and the northwestern states pay an unaccountable premium for Florida grapefruit—and California would, were not Florida grapefruit quarantined from the State. Tests by eminent men were cited to show that when the place of production was not known, the California fruit is preferred. But the Citrus Experiment station is testing new varieties and one may be developed that will entice the trade.

Prune and Peach Outlook.—That the growers need to take a hand in developing American prune markets was the main point made by E. N. Richmond of San Jose. Average American consumption was figured at about 96,000,000 pounds per year. Sales to Europe will not amount to much because our chief customer is cut off from commerce and the others are likely to hesitate on account of the high consumers' prices made necessary by advanced freight and insurance rates, and difficulties of shipping and financial exchange. Prune acreage soon to come to bearing aggregates 15,000 to 20,000 acres. Must dispose of the major portion each year because the carry-over of any crop vitally affects the coming crop. Believes that the peach situation today is due to the carry-over. We are marketing practically all of the 35,000 to 40,000 tons of dried peaches we raise every year, but there has been about the same carry-over for several years which has led peach growers to tumble over themselves to sell, thus cutting prices to disaster. To dispose of each prune crop promptly, we must advertise prunes as breakfast food. The New England states, where they are used most generally for this purpose, are our best markets. Breakfast foods have gained tremendous popularity because American consumption follows advertising.

Peach Outlook. — Horticultural Commissioner F. P. Roullard of Fresno county accepted the title of "goat" and pointed out that the State last year produced 330,000 tons green, but no one knows the proportion of these that were dried, canned, and shipped fresh, though we ought to. California ought to make money from her monopoly on dried peaches, but is not likely to do so while a large part of the crop is sold to the jobber before the blossoms fall. This line of fruit does not get the price effect of supply and demand. The yield averages about five tons green per acre, but varies between two and ten. The above-the-average yield is the only one that will allow the grower to break even, or make a profit. This must be gained by fertilizing, pruning, thinning, spraying, and more care in drying. Lack of a scientific system of sulphuring is a detriment. Has known peaches to get five sulphurings, making them like sole leather, which it is no wonder people won't buy to eat. But there is now no encouragement to produce quality peaches because bum stuff sells at the same price as carefully graded peaches. Graded prices ought to encourage grading and standardization of dried peaches. Not over-production, but under-consumption, is the cause of low prices and this could be overcome by lower prices to consumers, arranged by reducing the loss between them and producers.

Grape Outlook.—"This has been a symposium of pessimists," said Horticultural Commissioner Frank Swett of Contra Costa county, introducing his paper on the grape outlook, "but cheer up, the worst is yet to come." The wine grape troubles, present and prospective, were pointed out as of great injury not only to the table and raisin grape growers but also to tree fruit growers, for replanting of vineyards and deciduous fruits is going on on a large scale. Room for more early table grapes and those which will keep later in sawdust up to about 1,000 cars, were suggested as bopeful conditions. The array of papers on the outlook for various fruits was commended, to curb the enthusiasts who plant only to tear out their orchards as was general in the decade beginning 1900. More of general farming and livestock were emphasized as safe alternatives for the future. Use of grapes in by-products was urged by Frank Henry of Fresno county, who has a display of Muscat jelly at the Panama-Pacific. He would also increase the quality of table and raisin grapes, shipping only the best and feeding the rest to livestock.

Walnut Outlook.—J. B. Neff of Orange county sent an optimistic paper due to the improved co-operative system of handling walnuts and marketing them, pointing out the 13 walnuts per capita in U. S. which California is able to supply.

The International Irrigation Congress will meet in Stockton, September 13-14; Fresno, 15-16; Sacramento, 17-18; and San Francisco, 20. J. B. Case, president of the Congress, has recently arrived from Kansas, and is conferring with the chairman of the various committees.

REPORT OF FRUIT GROWERS' COMMITTEE.

The Fruit Growers' Committee of Santa Clara county met on July 24, and reported no increase in crop by any member, while the feeling was expressed that the present drop from sunburn (or other causes) combined with the extensive cracking that has occurred in many orchards, would tend rather to lower the available amount of sound fruit in sight. In regard to apricots, it is reported that very many have been disappointed in the amount harvested and the indications are that after the first heavy picking, prunes will also be disappointing. Growers are all busy now with the completion of the apricot harvest, but by next week will be more free to consider their prune interests, and the Committee asks them to be on the watch for some important announcement at their next meeting which takes place July 31, 1915.

California Vegetables in Garden and Field

E. J. WICKSON.

Third Edition.

Revised and Extended.

Gives the newcomer or old-resident beginner an understanding of the conditions he encounters in California; with descriptions of gardening practices which attain most satisfactory results. Conditions of soil and climate in California are so varied that practice must vary with them, and the author has handled the subject of **California Vegetable Growing**, as related to soils and climate as only one could do who has had opportunity for wide collection of data and personal observation as well.

Cover Crops for Permanent Fertility.

(Continued from page 97.)

the scene as a more promising applicant for the task. As two tons of the seed were sowed in the Highland-Redlands district this spring it is probable that a comprehensive verdict will be forthcoming within the year; for, although a biennial, it makes so vigorous a growth the first year that its efficiency as a subsoiler will be fairly proven.

It is difficult to believe that any of those ancient lands which, under continued irrigation, went into oblivion could not have been resuscitated by a few years of planting to alfalfa or the kindred clovers.

In a very lucid letter dated March 13, W. M. Mertz, of the Riverside Citrus Experiment station, says:

"I am sending you a statement of our results with cover crops for the season ending March 1, 1915. Everything points to the great need of an increased organic and nitrogen content in our soils if permanent success is to be achieved.

Best Melilotus Planted Early Sept.—"I have just returned from a trip through the Upland-San Dimas section and Whittier and Orange county, where I have been taking observations of cover crops. In Upland the Melilotus indica exceeded in development anything that I saw, including quite a little acreage of purple vetch. This purple vetch was superior to any of the common vetch acreages, but at this late date had become infested with aphis to such an extent that further development would be practically nothing. Melilotus stood two to three high and was in every way a good stand. A very noticeable difference was seen in the development of that planted in September and that planted later. Everything indicated that to get a good crop of Melilotus to plow by the first of March you ought to sow it not later than September 15. You probably know that the general soil type of the Upland section is a sandy gravel which has usually been considered a difficult one in which to grow cover crops. In San Dimas there was not much Melilotus, but several blocks showed good development fully equal to the purple vetch which was planted by Mr. Lindley at Azusa over quite a large acreage. Mr. Lindley is very enthusiastic over purple vetch. A planting of Melilotus nearby which I think cut as heavy per acre as the purple vetch was still in good vigorous growing condition while the vetch in many cases showed severe infestation with aphis. In Whittier I did not see any purple vetch; but the Melilotus clover, although planted on only a few ranches, was doing very well. The Leffingwell people had put in quite a little acreage very late and although they had a good stand it had not made very much development, ranging from 6 to 12 inches high. Another block planted about October ranged from 2 to 2½ feet high. This Melilotus was all infested with weeds to a greater or less extent. The weeds were in most cases mallow and mustard.

Early Sown 3½ Feet Tall.—"In Orange county I saw several hundred acres of Melilotus, much of which was an absolutely clean stand. This had been planted September 1 to the middle of October and ranged from 2 to 3½ feet in height. I did not see any purple vetch in that section. I saw the finest development of this clover in one orchard in Orange county right between Santa Ana and Anaheim. This orchard must have been 12 to 15 years of age and had been sown to Melilotus both ways. It stood more than waist high over the entire field and was as clean as it was possible to have a planting of anything. The uniform stand extended from flume to waste ditch. The soil was a sandy gravel. We also saw some very fine stands in an apricot and walnut orchard. In several other orchards the Melilotus had been planted very late in November and December and though as yet small, gave promise of making quite a yield before time for plowing under, which, as you know, can be delayed until a later date than is usually considered best with citrus. Our own results with cover crops this past season favored purple vetch in so far as tonnage was concerned. The seed of Melilotus which I obtained last year contained 8 to 10 per cent of weed seed, mainly mustard, so that the crop was materially reduced by this fact. However, the growth showed a yield of 17 tons per acre of green tops two weeks ago. The purple vetch was very good this year and almost clean. The yield of 21⅔ tons was obtained on this plat. Aphis did not affect it as has been the case of the Canada peas, so that possibly this may also account in part for the good development of the purple vetch at the Station."

In this matter of cover crops and humus, the layman and the professional are in the heartiest accord. In cold climates Nature leavens the soil by freezing and thawing. In warm climates her alternative is the roots of growing vegetation. We are studiously turning the pages of her open book; shall we not also lay hold upon the forces with which she works?

Melilotus Best Winter Cover.—Some weeks have elapsed since the foregoing was written, and my own conclusions concerning cover crops may be summarized as follows: Melilotus indica is the most vigorous and promising winter crop so far tried. I sowed it early in October and plowed it under late in May. It was then in bloom, stalks quite woody, and it promises to keep the soil loose and mellow until fall. I believe that a loose soil full of such decaying vegetation will be found cooler in summer than a soil carrying a growing cover crop, unless the latter is watered once a week. The three or four months intervening between plowing under and sowing again is just about sufficient to get the soil in condition for re-seeding.

I would advise sowing Melilotus alba only where the soil has become very hard. A rank summer cover crop seems to draw upon the soil so heavily during the season when the trees are producing their crop of fruit that their foliage comes to look pale and hungry. If alternate lands only in the orchard were so used this condition might be avoided.

So runs my 1915 cover crop story; five years hence all the plants now in favor may have been discarded for something better.

Five hundred acres of land has been purchased in Tehama county by Dr. Owen of Red Bluff and W. Herbert Samson of Corning. The new owners intend to graze a flock of several thousand sheep, in addition to cattle, on part of their newly acquired land.

California Garden-Flowers

SHRUBS, TREES AND VINES

Being Mainly Suggestions for Working Amateurs.

By Edward J. Wickson,
Hon. President, California State Floral Society.

FIRST EDITION—1915.
262 pages, 5½x7½ inches; illustrated; cloth bound;
12 full-page photo-plates and numerous text illustrations.

This book aims to tell the beginner in California, whether he be a scholar struggling with his school-garden, or a suburban gazing vacantly on his residence lot, or the farm-home maker, who is puzzled to translate his experience with teams, plows and pasture fields into trowels, pruning-shears and lawns, just what to do to make garden-soils, grow plants and surround his abode with beauty under the peculiar climatic conditions of California.

Mechanical Power on the Farm.

TRACTORS ON HARVESTERS.

[Written for Pacific Rural Press.]

The romanticness of the combined harvester is losing its zest in these days, especially on the level grain-fields of this State, on account of the replacing of the solitary driver perched above the herd of horses and mules, guiding them by a line or two and a loud voice and a long whip, by the perpetually coughing tractors, usually of the caterpillar type.

Yet the Caterpillar itself is almost bafflingly fascinating as it lays its track on each side of the engine, rolls over it, and picks it up continuously just out of the way of the harvester itself. One driver only is necessary for the outfit, whether of 32 mules or of one tractor, but both must be skilled drivers; while the one who guides a team may have a runaway, the tractor driver may on the other hand have to stop for repairs, though we saw none of either of these troubles on a recent grain-section trip.

Repairs need not worry the tractor driver if he overhauls the machine at every opportunity and keeps it in good shape. They had better worry him if they are necessary during the working hours of the harvesting crew, for the machine is supposed to make at least $60 a day for its owners, out of which is paid the wages of a crew of 5 to 7 men. Since it is desirable to get the grain out of the fields as soon as possible, continuous running is very desirable after the grain has dried off, in the morning. There is no need for the careful driver to have much trouble.

However, in making turns on steep hillsides, the tractors often have considerable difficulty. Most of the weight shifts to the lower side of the engine and she slides downhill in making a turn, losing much of the grip which is necessary to keep up a speed that will make the harvester run fast enough to beat out the grain.

Sometimes, too, the horse power of the engine is not enough to haul the harvester over a hill except on low gear, which is not fast enough to run the machine most efficiently. To minimize both of these tractor troubles, an auxiliary engine to run the machine while the tractor simply pulls it, costs a few hundred dollars and enables the harvester to work continuously in rush seasons. The tractor then gets no "tired feeling" nor overheating at 100 degrees temperature if properly cared for.

OIL STORAGE FOR FROST.

H. E. Wilkinson was cleaning some of his frost pots when visited March 2 last spring.

"The frost alarm went off at 32 degrees this morning; and I wouldn't take them up for a month yet, but we have so much spring work to do that we must take chances with a few of the pots."

About 25 acres of Eureka lemons are protected on this ranch by 1500 three-gallon pots, and 700 seven-gallon pots, built for perfect combustion. "For," as Mr. Wilkinson says, "we cannot afford to soot the fruit. That makes it mighty hard to wash and increases the danger of its rotting."

He uses "smudge oil" bought through the Fruit Growers' Supply Company. If it is bought in time, he gets a guarantee that the oil contains not over 6 per cent of the asphalt which is detrimental to the fires.

"I'm not afraid of 22 degrees temperature with my own equipment. We escaped harm from the big freeze when the thermometer went to 26 degrees and we could hardly face the wind, but I had as many as eleven men keeping the frost pots going. I would be afraid of coal pots. My observations of neighbors' coal-pot outfits is that they are slower to start and do not generate enough heat. If a man has any system at all, he might as well have the best." We had examined a number of such outfits that morning and found the kindling wet — dangerous business when frosts were probable.

His fearlessness is due partly to his ample equipment of large pots, as mentioned, and partly to his storage reservoirs, as well as to the usual frost alarm which is set at 32 degrees and rouses out about four men, two of whom have motor cycles, and all of whom are lighting the pots within half an hour.

The total capacity of the burners is 9,400 gallons. They are kept full and ready to light. He figures that 9,000 gallons is full night's burning. Besides what is always ready, there is a galvanized oil tank on a hill

with 10,000 gallons capacity and an 8,000 gallon cement tank, 11 feet deep, mostly underground. The underground feature is very desirable, but there is something the matter with the cement, since he estimates that 2,000 gallons of oil have been lost in the last five years by leakage, though he hasn't noticed any bad effect on the trees.

PORTABLE BARLEY CRUSHERS.

[Written for Pacific Rural Press.]

Several barley crushers on wagons able to move from ranch to ranch are operated in the Montezuma hills of Solano Co. One of these machines operated by Peter Lighthall crushes 800 sacks per day of six hours. The advantage of small portable outfits is that no one wants to crush too much barley at once on account of the mites getting in and spoiling it, and a portable outfit will serve for several farmers.

Mr. Lighthall's outfit is hauled from place to place by three pairs of horses or mules hitched tandem. A 26 h. p. Samson gas engine is mounted over the iron front wheels of a long wagon truck, while the crusher is set over the back wheels, with fuel tanks between them.

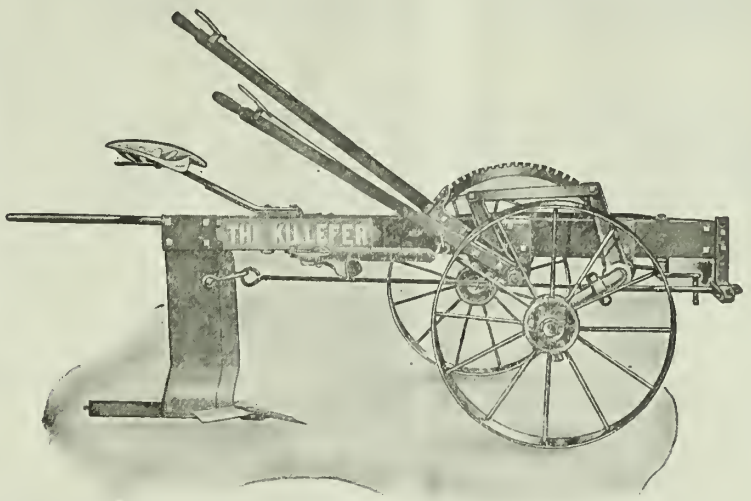
In cases where the barley is picked up after the thresher and piled near the gate of the field, to use one of these portable barley crushers saves once handling of the grain. It may be crushed there and hauled directly to the store house.

The outfit is driven up beside the pile of barley, a canvas is spread out under it to catch whatever may be spilled in the crushing, the brakes are set on the wheels, and the engine started. Two men dump the barley into the hopper; one man packs the rolled barley into sacks from two chutes; and two men sew the sacks. Mr. Lighthall himself superintends the job and takes care of the engine. The fuel and oil costs about $5 per day of six hours.

Perry Anderson of the same district has a system which is better under many conditions, for he uses a Caterpillar to haul the outfit from place to place. When the machine is set for a job, the Caterpillar's belt wheel is connected to the crusher and business begins. In this way, the power that is used in hauling the outfit is not idle during the time the outfit is rolling the barley, and the separate engine is unnecessary.

QUICK PLOWING AFTER RAINS.

"Tractors are what saved the Yolo grain farmers this year," says Farm Adviser N. P. Searles. "It rained pmp, pmp, pmp all through March, April, and early May, so when good weather came and the ground was fit to work they had to go to it with a vengeance, plowing night and day; or they never would have gotten the grain in. With horses so scarce, they could not have gotten stock enough to do the work."



Horse breeders using tractors may be seen in Solano county where John McCormick, owner of some fine stallions, uses tractors to run night and day during the rush plowing season. Both are and will continue to be necessary to California agriculture.

Chas. M. Connor of Orosi has been appointed Farm Adviser of Stanislaus county to take up his duties at Modesto on July 29.

One Row Beet Plow

KILLEFER QUALITY

KILLEFER EFFICIENCY

Was designed for the smaller grower where horse power was not available for handling the larger two-row plow. The draft is very light and no more weight has been used than was necessary to give the proper strength.

The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.

We build this plow with either straight, sloping or bent standards and with any style of wing or point required.

The Killefer Manufacturing Company

2209 Santa Fe Ave. Los Angeles, Cal.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

The largest orange packing plant in the world, having a capacity of 22 cars daily, is claimed for Lindsay.

It is estimated that the California lemon crop up to June 15 has been 8000 cars, or double that of 1914.

A date farm under the direction of W. R. Nuttlng is reported to have been started on 60 acres near Reedley.

Fumigation for gray scale has commenced in Tulare county, the orchards around Lindsay being the first worked on.

An association to market fruit through the California Fruit Exchange is under consideration by the orange growers of Garden Grove, Orange county.

A dividend of $15,000 has just been received by orange grower members of the Monrovia Fruit Exchange; and it is expected that the season's total dividends will total $60,000.

The packing of early Valencia oranges has ceased at the packing house of the Anaheim Citrus Fruit Association. This association has grown in its six years' life from 14 members and 80 carloads of oranges to over 200 members and 500 carloads of fruit.

An organization known as the Northern Tulare County Citrus Association has been formed at Sultana, and the construction of a packing plant has been commenced. The following officers are in charge: C. C. Threlkeld, president; Edw. Scruggs, secretary; and these with E. Barris, J. E. Simons, and A. Schilling constitute the Board of Directors.

DECIDUOUS FRUITS.

Two thousand cases were put up in the first day's work at the two Visalia canneries.

The contest for fresh fruit prizes at the Panama-Pacific Exposition will be entered by Nevada county.

The Fifth Annual Apple Show will be held at Mendocino on October 26 to 29.

On July 24 the first freight shipment of Tuscan cling peaches left Atwater.

The shipping of fresh peaches has begun in Yuba City, several carloads having gone out recently.

The Sacramento plant of Libby, McNeill & Libby will operate full force this summer.

An apple show will be held at Yucaipa, San Bernardino county, during three days in October.

Shipping of Bartlett pears will commence at Grass Valley on August 1, and the crop promises to be a very large one.

It is stated that shortly 20 carloads of Gravenstein apples from Sonoma county will be shipped to South America.

Early in August the International Apple Shippers' Association will hold their convention at Chicago in connection with their sixth annual apple show.

Forty acres of five-year prunes and almonds were recently purchased from Alexander T. Gibson of Butte county by James and John Kelly of Fairbanks, Alaska.

That the Kings county fruit crop will amount to about $1,475,000 this season, is the estimate made at the present time. The new standardization law which becomes effective Aug. 9 will not be enforced in that county as most of the fruit will have been shipped by that time.

At a recent meeting of the Santa Clara Farmers' Union it was decided to hold for good prices all fruit handled by the association; members of the Union handling their own fruit expressed the determination to do likewise.

Last November a grower in Chico, discouraged at the low prices being paid for dried peaches, packed his product in sacks and shipped the lot —thirty tons— to Minnesota. He followed, and opened headquarters in one of the interior towns, selling direct to the consumer. After having disposed of his entire crop at a good price, he recently returned home to look after the harvesting of this season's crop, which he intends to dispose of in the same way.

OLIVES AND NUTS.

A record crop of almonds is reported from the Pennington section of Sutter county.

A co-operative association of Oroville olive growers is under consideration.

A consular report states that the 1915-16 southern France olive crop is encouraging.

Santa Barbara county's walnut crop will be 20 per cent above normal, according to the County Horticultural Commissioner's estimate.

On account of the discovery of water in the West Palermo section, an olive boom is being experienced, hundreds of acres being planted.

The California Almond Growers' Exchange has received under date of June 30th, 1915, crop report from their representatives in Spain, who have been investigating conditions abroad for the Exchange. They state: "Since we last wrote you we have heard from Italy to the effect that the new crop is not expected to yield more than forty to fifty thousand bales and is said to be practically a failure. The crop last season was three hundred thousand bales. No news from Persia yet, but reports from Morocco agree that the crop there is going to be fair. In the Alicante district in Spain the crop promises to be an average one. The Valencia crop is only fair and the Jordan crop is generally disappointing."

The Spanish and Italian nuts are those generally imported by the

Important Announcement to Dairymen

NOW IS THE TIME TO PLACE YOUR ORDER FOR THIS SEASON'S SUPPLY OF

LARROWE'S DRIED BEET PULP

OWING to the enormously increasing demand we suggest that you place your order with your feed dealer now, for your season's requirements, to avoid possible disappointment.

Those who have used this succulent, milk-producing, vegetable feed and know the certain and profitable results obtained by its use, do not need to be told of its richness in carbohydrates and its general desirability as a ration for dairy cows.

To those who are not using LARROWE'S DRIED BEET PULP we will gladly send evidence of remarkable results obtained by prominent dairymen and feeders, together with valuable suggestions concerning feeding.

GET 1 TO 5 LBS. MORE MILK FROM EACH COW

If you are feeding an exclusive diet of alfalfa, just try the addition of Larrowe's Dried Beet Pulp and see what a difference it makes. Not only will it increase the milk flow one to five pounds per cow a day—the increase being noticed almost immediately—but it will make your cattle healthy, sleek-coated, bright-eyed and prolong their milking periods.

Larrowe's Dried Beet Pulp is light, bulky, succulent and easily digested; absorbs water very quickly and swells to about six times its original bulk; is cheaper than bran and other mill feeds, yet produces better results.

It is put up in convenient 100-lb. sacks, and may be had either plain or with molasses. Ask your dealer for "Larrowe's."

WRITE FOR OUR BOOKLET—"PROFITABLE FEEDING"

—containing valuable information on feeds and feeding together with instructions for feeding dried beet pulp. Sent free on request. Address:

THE LARROWE MILLING COMPANY
934 CENTRAL BUILDING LOS ANGELES, CAL.

United States and it has been said that the price named by Italian shippers very largely influenced the market on shelled almonds. The almond crops in Europe, like those at home, are not nearly so promising as was the case some weeks ago. In several districts in California the crop will not be equal to last season and quite a number of growers have reported complete failures in their immediate locality. On the other hand, some new acreage is coming into bearing in the newer districts this year which will, to some extent, offset this deficiency. It can be said, however, that as a whole the almond crop in California is not nearly so large as those who are interested in low prices would lead growers to believe. The trend of events in Europe will probably determine later the policy with regard to future prices.

GRAIN AND FIELD CROPS.

Potatoes are the most important crop grown in Alaska.

The Corcoran grain crop is estimated at 700,000 sacks this year.

A Lemoore corporation will plant 700 acres of beets in the Stratford district this fall.

A rice mill to take care of their products is under consideration by growers of Yuba and Butte counties.

The Canadian wheat crop is estimated at 200,000,000 bushels, in spite of unfavorable weather conditions.

One thousand tons of alfalfa hay have been ordered from Yolo county to be shipped to the Humboldt County Farm Bureau.

A co-operative association of rice growers has been formed at Oroville to be known as the Pacific Coast Rice Growers' Association.

After rigid investigations, it has been found that the Stanislaus county bean crop is absolutely free and undamaged from insect pests.

Griffith Bros. of Fresno and San Francisco are said to be contemplating extensive operations on their land in the rice belt near Wasco.

The melon season at Turlock is in full swing; up to July 20 twenty-six cars had been sent out. Fourteen dollars per ton is being paid to the growers.

On account of the success of the experimental planting of 300 acres to sugar beets in Oakdale, the acreage will be greatly increased this coming season.

With 55,000 acres in bearing, it is estimated that the Kings county alfalfa crop will return to the growers more than two and a half million dollars.

A large amount of alfalfa has has been reported to have been purchased in San Joaquin county by the manager of the Humboldt County Farm Bureau.

A contract for 300 tons of baled alfalfa hay at $8 a ton has been made with E. R. Watson & Sons of Dixon by the Humboldt County Farm Bureau.

On the Natomas Consolidated reclamation district in a fork of the American and Sacramento rivers is a large acreage now planted to beans and corn.

A field of 200 acres of Indian corn in the Delta islands is reported by Farm Adviser F. F. Lyons as having yielded 90 bushels per acre last year.

Exportations of beet pulp to the United States from Spain are rapidly increasing. From Barcelona in 1914 pulp to the value of $119,052 was sent to the United States, as against $67,950 worth in 1913.

Several thousand bushels of grain were so tightly packed in the warehouse of the Deacon Lumber Company at Lemoore as to cause it to burst last week. The building was totally wrecked, the loss estimated at $4000.

GRAPES AND SMALL FRUITS.

The packing of Thompson Seedless grapes began on July 22 at the Dinuba packing house.

The hot weather has hastened the ripening of grapes in the Dinuba section, and if it continues the first Malagas will probably go forward on Aug. 1 instead of 15 as was first expected.

MISCELLANEOUS.

Trinity will take part in the Northern California district fair to be held at Redding in September.

The Turlock Merchants' and Growers' Association has elected the following officers: President, C. C. Carlson; First Vice-President, Geo. Scherer; Second Vice-President, W. H. Lockwood; Third Vice-President, Dave Johnson.

During the Fruit Growers' Convention at Stanford University, college men engaged in agriculture will meet around the banquet table Friday evening, July 30, for consideration of the formation and permanent organization of college men engaged in agriculture, irrespective of what State or college they come from. All men are urged to be present.

Meetings of interest to farmers to be held at the Exposition during the week of August 2 to 8 are: Association of American Dairy, Food, and Drug Officials, Aug. 2-5; The Society of American Bacteriologists, Aug. 3; The Universal Corn Convention under the auspices of the National Top Notch Farmers' Club, Aug. 5; California State Bee Keepers' Association, Aug. 5; and Official Dairy Instructors' Association, Aug. 7.

A co-operative association to engage in general shipping, buying, and hauling of farm produce has been organized in Fallon, Nev., and will be known as the Farmers' Union Co-operative Association.

A special refrigerator car carried by the Green Fruit Special over the Santa Fe will enable farmers of Tulare to send their produce of all kinds to Los Angeles in exceptionally good time; the car will leave Tulare at 8:45 p. m. and reach its destination at 12:00 o'clock the following night, and a reduction of shipping rates over express rates has been made.

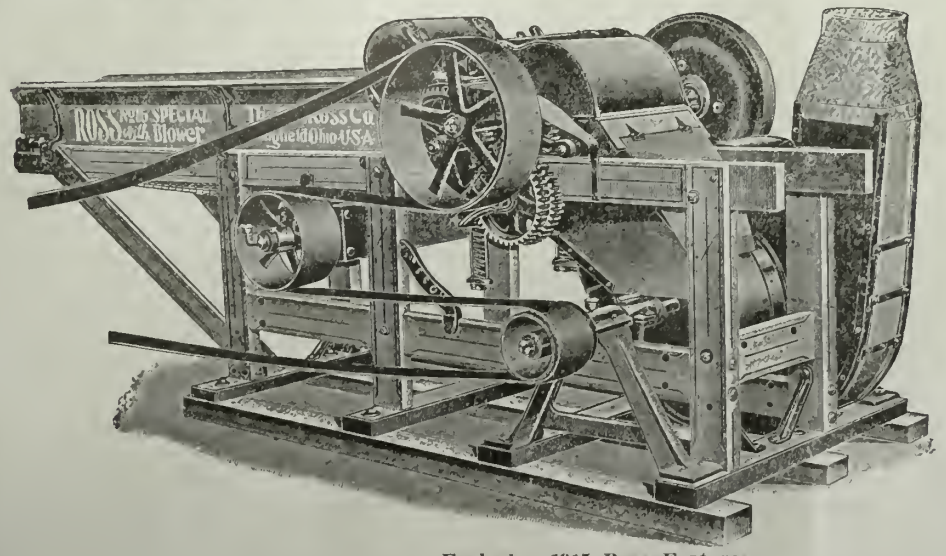
One Thousand Questions in California Agriculture Answered



Consists of 1000 of the most important questions on every subject that have perplexed the farmer and which have been submitted to the editor. The problem appears with its solution by Prof. Wickson immediately following; a comprehensive index enabling the reader to find the subject which interests him without delay. The 1000 questions and answers cover Fruit Growing, Vegetable Growing, Grain and Forage Crops, Soils, Fertilizing, Irrigation, Live Stock and Dairy, Diseases of Animals, Feeding Farm Animals, Poultry-keeping and Pests and Diseases of Plants, etc., etc.

This is a book of reference that every farmer, no matter in what branch of farming he is engaged, should have on his shelf. First Edition.

Price, $1.50 postpaid.

THE possibilities for engaging in the dairy industry in California do uot require comment. However, for the benefit of the minformed I might state that in the past decade this industry has made very rapid strides. Not many years ago we found it necessary to import from the East a large portion of our butter and cheese, while today our dairy industry has so increased that we are producing enough to supply our own demands and also export some to other states and territories. With an expanding market there is no fear that this great industry will be ever overdone by ruinous competition. Butter prices will always hold up, and consequently the opportunities of engaging in this industry are as bright or brighter today than they ever were. Farm journals and Experiment Stations in the Middle Western states are urging their dairymen to raise alfalfa as they realize that this is the ideal roughage for diary cows. But a Middle Western alfalfa raiser does not know what a real crop of alfalfa is unless he visits the Sacramento or San Joaquin Valley. Their short growing season leaves the Middle Western dairyman no opportunity of successfully competing with us.—Charles Keane, D. V. S., State Veterinarian.

How a Cow Testing Ass'n Succeeded.

The Principle of Cow-Testing Associations Assures the Dairyman a Square Deal from the Creamery, and Tells Him the Butterfat Value of Every Cow. Testing Makes for Profit—Not Expense.

[Written for Pacific Rural Press.]

If you can't convince a dairyman to join the local cow testing association on the grounds of higher production, perhaps you can show him how a check on the buyer of his cream would be worth the cost of testing.

That is the way that Geo. H. Zehndner, tester for the Arcata Cow Testing Association, has induced a number of large Portuguese farmers to join the Association, and the gratifying part of the whole thing is that once they start to check up the cream test, they continue in order to be sure their cows are not worse robbers than the creameries.

Last year was the first time that a cow testing association was available to dairymen around Arcata, the Ferndale Association having tested about 800 cows there. This year, however, it was thought best to establish an association at Arcata, and at present there are 1200 cows entered in the new association. This represents better than 25 per cent of all the cows in the section and it is thought that in time a much higher percentage will be tested.

The smallest herd tested is a six-cow one, and they run from that up to over a hundred. Payments are made every three months in advance, the annual cost being one dollar per cow. Dairies with less than 25 cows are not visited by the tester other than to collect the samples once a month. The practice in these small dairies is to leave the dairyman sample bottles and scales and teach him how to take his own samples as well as weigh the milk. If there are several small dairies close to one another, the testing is done on one dairy for all of them; otherwise, the samples are taken to the nearest large dairy where they are run out. This makes it possible for the small dairyman to receive equally as efficient results from his membership in the association as his larger neighbor, and also permits the tester to handle more cows than would otherwise be possible.

As it is to everyone's interest to know absolutely what his cows are doing and what his test is, no instance has been noted of members being anything but honest in their weighing and taking samples of the milk.

Five large Portuguese farmers have joined the association primarily to check up on a creamery they were selling to and they claim that the savings from this alone have more than justified the expense. In fact, one stated that he had received higher tests from the creamery this year than ever before since he has been dairying, although he has the same herd and same conditions.

As the principles of testing are chiefly to cull out the boarders, however, Mr. Zehndner is rapidly convincing the dairymen of the value of the test other than the creamery check; and stated that he considered it entirely possible that all of them, as well as many others of their nationality, will retain membership in the association for the purpose of building up their herds.

This is being made possible by the comparison of records which the association furnishes, the highest average production for the month of May being 50.1 pounds of fat, while the lowest was but 27 pounds. The 50-pound herd is one which has been steadily improved for years with purebred Jersey bulls and it stands out so conspicuously as a producer that even the most skeptical can see the need of improvement along the same lines.

COWS, PRUNES, COVER CROPS

[Written for Pacific Rural Press.]

The orchard helps the cows and the cows help the orchard on the Sorosis Farm in Santa Clara county. There are 240 acres of orchard, mostly prunes. All of it is under irrigation, so cover crops can be handled at pleasure.

In one part, alfalfa is grown in broad strips between the rows of trees and is cut as a soiling crop for the dairy cows, of which there are about 50. Legume cover crops such as Canada peas and vetches are grown on a large part of the orchard and the cows are turned onto that a few hours every day until they get full, during the first four months of the year.

The Sorosis people have been buying pea vines from the cannery to make silage, but it is now proposed to use the peas and vetch grown as winter cover-crops to silo for summer feed for the cows after they are taken from the orchard. The manure from the cows is returned to the orchard.

The owners get cash from both the fruit and the dairy branches of the farm while each branch helps the other to make more money.

A JERSEY ADVOCATE TO THE FORE.

To the Editor: I see in a recent issue of the Rural Press an article signed "Reader, San Joaquin county," wherein he states it is almost impossible to sell a Jersey bull. If he has grades, quite likely he is right, as with other breeds, also; if he has registered Jerseys, probably the reason is he has done no official testing, as people nowadays want official proof of what they are buying. My reason for thinking so is that I don't believe there are two registered Jersey bulls old enough for service in Stanislaus county for sale. Of course, on account of write-ups of other breeds you would think that the Jersey had gone back to the Island, but the Jersey is soon going to tell the dairy world what she has been doing while she was thought to be asleep. I have seen such foolish ideas published about the Jersey cow's constitutional weakness. Why, on the Island of Jersey, the inspectors have failed to find a single case of tuberculosis, and she is found way in the North, also way in the South. In Australia and New Zealand she is the settler's choice almost without exception. Now the Jersey cow may be the tail end of the dairy world, but the tail end is what counts with me if it is on the Jersey. Yours for more Jersey bulls to make more better dairy cows, also thanking the Press for its stand on dairy matters.

1501-3-5 So. Main St., Los Angeles

PACKERS estimate that 350,000 head of cattle are consumed annually by the California markets. Of this amount, 200,000 are shipped into the State from Arizona, New Mexico, and Nevada. Those brought from Nevada are mostly in a finished state. Those brought from the Southwest, which constitute the largest number of the State's imports, are mostly for maturing and fattening purposes. The additional revenue secured from raising such cattle in this State would increase the earning power of California's land several million dollars annually. This can be accomplished by breeding more on the range and maturing and fattening less, allowing the smaller farmer an opportunity to finish on higher-priced lands and feed.

California's War Horse Trade to Date.

It is Stated that 300,000 Horses for the European War Already Have Been Shipped from This Country. Buyers Are Now in California—but How Many Will be Needed Is Problematical.

[Written for Pacific Rural Press.]

From earliest history, a horse sale has been covered with more or less secrecy; but seldom has it been so difficult to "get a line" on the horse game as has been the case since European buyers started purchasing cannon feed a year ago.

Dealers, as well as farmers, have been "up in the air," generally speaking, and real news or information seems impossible to uncover till such information is past history.

Wild guesses are made almost daily and will probably be continued, for as long as the European buyer can keep us guessing he is in a better position to buy at his own terms.

At the present writing, the situation from a California and Nevada standpoint seems to be about this: The French, English, and Italians have been the chief purchasers. At the beginning of the war they confined their efforts to the East and Middle West, cleaning up the country there of the most desirable animals. This buying was done in various ways, always under cover of secrecy in order to create an uncertain feeling, and thereby hold prices down.

After cleaning up the Eastern and Middle Western territories, they shifted their chief activities to the Rocky Mountain territory and have gradually reached out to California from their present base at Denver, Colo.

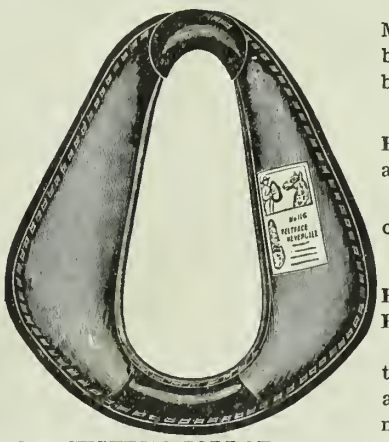
To date there have been approximately 10,000 horses and mules purchased for this war trade in California, according to the best belief of horse dealers here. Nevada, they claim, has already been pretty thoroughly cleaned up except fuzz-tails and other undesirable types.

To date the French have done most of the buying here, their purchases being confined almost exclusively to gunners. Their specifications for this type call for horses over five years old, not less than 15 hands, 2 inches high, and weighing from 1100 pounds up. Good heavy bone is demanded, no preference being shown for mares or geldings, except that they must not be whites. Animals which do not meet these requirements are rejected.

One San Francisco dealer at whose yards about 600 head of horses were inspected by French buyers, states that so far prices have ranged between $130 and $160 and that this was much less than it would have been had the local market been at all active. He claims that many of these horses would ordinarily sell on the local market for $200 to $250 and are really worth that figure. Of the 600 head inspected at his yards, he believes not more than 20 were poor animals, and gives the inspectors credit for being careful and judicious buyers.

It seems, however, that the regular horse dealer is not getting very fat on the war horse, due to the fact that the principal buying is done in the country. At present one large dealer in Denver has 30 buyers in California scouring each county or section where horsese might be available. His usual procedure is to offer the farmer so much for his horses if they pass inspection. He is accompanied by a veterinarian who does the inspecting, and the deal is closed up if all conditions are favorable to farmer and buyer. These horses are then assembled at a central point and shipped to Denver where the foreign buyers do their inspecting. If the horse does not pass, it is sold on the Denver market for what it will bring. If accepted, it is sent to some Atlantic seaport for ocean shipment.

Country buying makes secrecy still more possible as no one can collect data from such scattering sources. The city dealer's chances of controlling the supply are obliterated by country buying also, as the foreign buyer can pay the farmer as much as the dealer receives after assembling the horses and standing the loss on rejected ones. It is a clever scheme to cut out more than one middleman and seems to be working perfectly. Attempts to cut in on the profits of this trade have been made in some localities by parties assembling horses at one place for inspection in the country. Notwithstanding the inspector's promise to purchase those coming up to specifications, they have in many instances failed to even make an appearance, thus leaving the speculator with a big bunch of unmarketable horses. Later perhaps another buyer turns up and gets the horses at his own figure, due to the fact that no one knows when the demand will stop or how far it will go.



The English have not been active in this field, but are beginning to make heavy purchases of mules. Mule prices are given at the same figures as for horses, the chief specification being that they weigh from 1100 pounds upward and are good boned and sound. Six hundred head of such animals were assembled at Roseville last week and buying in this line is expected to continue, although, as with horses, no one can be certain.

Reports have it that French and British buyers are letting off, but that the Italian buyers will soon enter the market. In the past, the Italians have not sought class, but are said to be changing their methods now and will demand good ones.

One French buyer who operated in San Francisco estimated that his government had purchased 300,000 head of horses in the United States to date. Considering the proposition from the various angles, it seems very probable that California buying completes the first combing of the country, as it is the furthest point of shipment. On their first trip, they are picking the cream. If the war continues, they will come later to accept what they have been able to reject this time.

The whole thing is problematic, but at any event the owner of good horses can feel confident that he is in a safe position, for though he may not get his price from the foreign buyer, it is certain that the home market will be affected by the clean-up now going on and that prices will likewise hold up for really desirable types.

BEWARE OF CHEAP, EASTERN MADE HORSE COLLARS

More shoulders are being ruined by poorly-constructed collars than by the work the animals are doing.

W. DAVIS & SONS'

FELTFACE COLLARS are guaranteed to prevent sore shoulders.

Look for the felt at the edge of the stitching.

Made to sell as follows:

FELTFACE, medium draft, $5.00
FELTFACE, heavy draft... 6.00

If your dealer does not have them, we will tell you where they are to be had, or send direct if no dealer is within reach.

Our CUSHION COLLAR, a canvas and leather Boston Team Collar, is now to be had for $3.00.

DAIRYING.

The Sixth Annual Dairy Cattle Congress will be held on September 27 to October 3 at Waterloo, Iowa.

About one thousand pounds of butter per day are being made at the plant of the Laton Co-operative Creamery.

A cow 23 years old, giving three and a half gallons a day at the present time, was recently found on the ranch of Henry Baty near Tulare.

The second semi-annual sale of registered Holsteins of the Western Washington Holstein Breeders' Association will be held Sept. 15 on the Snohomish County Fair Grounds.

A picnic under the auspices of the Humboldt County Dairymen's Association will he held at Loleta on July 31; among the speakers of the day will be Prof. J. I. Thompson of the University of California.

Stanislaus is the banner dairy county of California; and according to the annual report of the County Assessor, there are 6,500 head of cattle, both dairy and feeder stock, in the county.

Aaggie Acme of Riverside 2nd, owned by A. W. Morris & Sons, four years old at the beginning of her semi-official test, has a seven-day record of 28.48 pounds of fat; and is expected to make 1000 pounds of butter in the year.

Extension work in dairying is to be taken up by the University of Nevada in co-operation with the U. S. Dept. Agr. by the appointment of a Field Agent to work continuously with the farmers in learning their problems and helping them when possible.

The State Dairy Bureau has an income of over $13,000, according to an audit recently made of the books. Fines totaled $6798.92; the money received from oleomargarine licenses amounted to $5423.70; and other items of income, including $1582.05 for laboratory tests, made up the total.

Recent sales by the Carnation Stock Farm at their stables on the Exposition Grounds are as follows: Young bull, Premo Gerber Julip 5th, to Peterson & Persson, Avent; Premo Gerber Julip 2nd to H. S. Tregoning, at Caspar; and registered heifer to Ruby N. Williams, Palo Alto.

The great increase in the dairy industry in Orland is shown by the fact that during the last six months the number of dairy cattle in that section has increased from 2560 to over 3500. A year ago, one creamery was in operation, turning out about 700 pounds daily; now two creameries turn out about a ton a day.

In the recent butter scoring contest held under the auspices of the University of California, butter from the Visalia Co-operative Creamery took first place; the Sunset Creamery of Loleta, second; and the product from the Hanford plant of the Los Angeles Creamery Company, third.

Word has been received from McAlister & Son of Chino to the effect that the date of the A. W. Morris & Sons and McAlister & Son combination sale this fall at Sacramento has been definitely set for October 6 and 7. This sale will embrace many high seven-day and yearly record cows, and every animal consigned will be of splendid individuality and every cow a large producer. McAlister & Son will consign in all 75 head.

The alfalfa sold by the Yo-Solano growers to Humboldt county dairymen will return in the form of butter to San Francisco and probably sell at better prices than the Yolo county product, owing to the fact that the Humboldt county people pay better prices for graded cream.

J. E. Thorpe has offered a pure-bred Duroc pig to the winner of the first quarter's cow testing in the San Joaquin County Association, in which they now have 1,100 cows. One man is claiming the pig already because he has led for the first and second months during which the association has been running.

CATTLE AND SHEEP.

The weather in Arizona is reported to be hot and dry, but the ranges are in fine condition.

It is estimated that the cattle shipments from Gila county, Arizona, will exceed $1,000,000 this year.

Twenty-five head of beef cattle were recently sold by J. J. Leonardo of Alameda county to a Tracy butcher.

P. Connolly of Livermore valley recently purchased 25 fine Shropshire bucks from C. E. Barnhart of Suisun.

During April of this year, cattle rustlers made away with 137 head from Colusa, Yolo, and Lake counties.

Four hundred head of Mexican steers were recently sold by Archer Parks of Alameda county to the Oakland Meat Company.

An order for ten Merino rams to be shipped to the Hawaiian Islands has recently been filled by Chas. Kimble of Hanford.

Forty carloads of Mexican cattle were recently sold by the Hearst Estate of Alameda county to an agent of the French Government.

W. J. Martin of Pleasanton recently purchased 40 head of beef cattle from J. J. Moy and 15 head from Nevin Bros., both of Alameda county.

The Carmel Cattle Company near Wasco has about 3200 head of stock. It is the intention of the owners to plant 2000 acres to alfalfa next season.

Frank Wilder, manager of the Bald Hills range of Shasta county, recently sold two carloads of cattle to the San Francisco markets for the Menzel Estate Company.

It is said that the French Government is in the California market for 40,000 head of beef steers, weighing from 1150 pounds upward, in trainload lots.

25 POLAND CHINA SPRING BOARS—Jan., Feb., March farrow. Prices, registered and crated, $20, $15, $10. Edwd. A. Hall, Watsonville, Cal.

DEL DAYO FARM—(Old Haggin Bottom Ranch)—Breeders of Registered Berkshires, both sexes for sale. P. O. Box 1140, Sacramento, Cal.

PLAINFIELD STOCK FARM—Registered Berkshires and Durocs. Young stock for sale, both sexes. H. M. Bullard, Woodland, Cal.

REGISTERED BERKSHIRE SOWS and their weanlings. Quality, health and vigor. Boars, all ages. F. H. Wilson, Turlock, Cal.

GLENVIEW POLAND-CHINAS—Baby pigs from best families for sale. From $15 up. Chas. E. Hanna, B. 3, Riverside, Cal.

IMPERIAL STOCK FARM BERKSHIRES—Quality and price guaranteed to satisfy. B. J. Merrill & Son, Morgan Hill, Cal.

REGISTERED BERKSHIRES — Weanling boar pigs $10.00 each. A few older boars. J. M. Bomberger, Modesto, Cal.

BERKSHIRES—Utility and Choice Registered Pedigree stock. Correspondence solicited. C. H. Thompson, Novato, Cal.

REGISTERED POLAND-CHINA SWINE—Prize winners. Finest stock in the State. $20 up. M. Bassetti, Hanford.

REGISTERED DUROC-JERSEYS from Eastern sows. Six months gilts and boars. S. B. Southworth, Napa, Cal.

FAIR OAKS RANCH, WILLITS, CAL.—Registered Duroc and Berkshire Swine. Weanlings for sale.

REGISTERED POLAND-CHINA HOGS—Cholera immune. W. D. Trewhitt, Hanford.

POLAND-CHINAS—Prize-winners. Money-makers. B. Bernstein, Hanford, Cal.

HOPLAND STOCK FARM—Registered Berkshires. Prices on application. Hopland, Cal.

POLAND-CHINAS—Large type. The Browning Stock Farm. W. H. Browning, Woodland, Cal.

POLAND-CHINAS — Prize-winners. Satisfaction or money back. Geo. V. Beckman, Lodi, Cal.

REGISTERED DUROG-JERSEY SWINE—Las Pedernas Ranch, El Cajon, Cal. M. S. Allen, Manager.

REGISTERED POLAND-CHINAS — Young stock for sale. Hewitt & Hewitt, Hardwick, Cal.

DUROGS—Weanlings and a few choice bred gilts. H. E. Boudier & Son, Napa, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. T. H. Beckman, Lodi, Cal.

KNOB HILL STOCK FARM—Registered Poland-China swine. A. M. Henry, Farmington.

READAKS RANCH herd of registered Poland Chinas. W. J. Hanna, Gilroy.

REGISTERED BERKSHIRES—Young stock for sale. F. W. White, Elk Grove, Cal.

BERKSHIRE BOAR PIGS—Butte City Ranch, Butte City, Glenn Co., Cal.

CHAS. GOODMAN, Breeder of high-class Berkshire Swine. Williams, Cal.

POLAND GHINA HOGS—Registered. E. J. Miller, Llewellyn Ranch, Lathrop.

DUROGS—A few bred gilts, boars and gilts left. E. C. Curtis, Napa.

REGISTERED O. I. C. SWINE—C. D. CONEY, Lakeport, Cal.

POLAND-GHINA HOGS—C. A. Stowe, Stockton, Cal.

SHEEP.

FRANK MEACHAM, Petaluma, California.—Breeder Shropshire, Rambouillets, American Merinos, both sexes. Take electric car at Santa Rosa or Petaluma for Live Oak.

SHROPSHIRE LAMB BUCKS—Yearlings and two-year-old rams for sale. J. R. Bloom, Dixon, Cal.

BULLARD CO.—Breeders and Importers of Rambouillets. Hanford, Cal.

CHAS. KIMBLE—Breeder and Importer of Rambouillets, Hanford, Cal.

BISHOP BROS., SAN RAMON, CAL.—Breeders and Importers, Shropshires.

MISCELLANEOUS.

OWING TO THE MANY requests of our customers to give them information as to where they can buy or sell dairy stock, we have established a livestock bureau in connection with our office. For anything in this line write us. V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

FOR SALE—8 Holstein cows and heifers. 2 Percheron Fillies. All high grade or registered. Home grown, excellent stock for foundation breeding. Call to see them at the home place, Glenoak Farm of L. N. Irwin, Davis, Cal.

mal Industry of the Philippine Bureau of Agriculture has gone to India and China to secure breeding cattle for the Government stock farm, for which $12,000 was recently appropriated by the legislature.

Four young Devon bulls were recently purchased from the Carneal ranch of Alameda county by D. W. Wallis for Miller & Lux. These animals will be distributed to the various ranches of the company for the purpose of improving the strain of Devon cattle which they are cross-breeding with Durhams.

A meeting of sheep raisers of Sonoma and Mendocino counties has been called for some time in the near future by State Veterinarian Keane, in order to take action on the prevention of sheep scab and to prevent a sheep quarantine which seems probable at this time.

A butcher in San Joaquin county is buying sheep carcasses from the Western Meat Company at 10 cents a pound, while he has wethers of his own in the corral waiting to be butchered, but which would cost 15 cents a pound at the shop. This man says that sheep would be a fine game for all the small farmers who could get a few ewes.

Although the war stopped any importations of Australian mutton, which a year ago were feared would flood the markets here, it is probable that none would have been shipped here anyway, as the British Government was recently notified that on account of the drouth further importations of Australian mutton to England would have to be stopped, as every pound available was needed for home consumption.

On July 9 the first importation of foreign cattle entered the port of New Orleans. The shipment was made to the National Stock Yards at East St. Louis by the Raffety Cattle Co. of Guatemala.

Nine thousand head of sheep were recently purchased by H. Curtz and Frank Belcinige from a breeder in Grant county, Ore. The animals are now on the drive and are expected to reach Montague on Aug. 10, at which time they will be divided, half going to Sacramento and the other half will be ranged in Siskiyou county.

The Southwest Stockman-Farmer reports that a prominent wool grower of Kansas City states that he believes wool will advance 50 cents per pound before the end of the year. He also believes the exports of woolen goods from this country will reach a value of over $100,000,000 next year.

Segis Pontiac de Kol Burke

1st Prize 2-year-old Cal. State Fair 1914.

The bull that combines the blood of the greatest producing families in Holstein history. He is an outstanding individual, weighing 2200 at just three years of age. His dam RIVERSIDE SADIE DE KOL BURKE, is the heaviest milker that the breed has ever developed. She and six of her sisters have records above 30-lbs. butter in seven days.

A few sons of this sire are now available, some of which are soon ready for service. Several are from half sisters to Aralia De Kol, 30-lbs. butter in seven days at 12½ years, 28090 lbs. milk and 1142 lbs. butter in one year. Prices reasonable.

Pedigrees and Prices on Application.

A. W. Morris & Sons Corporation

Box 398-D, Woodland, Calif.

HORSES AND SWINE.

C. C. West of Tulare county is starting a stock farm on his ranch near Poplar. He now has 200 head of hogs fattening on 250 acres of wheat and 60 acres of alfalfa.

Experimental raising of hogs has commenced at Fairbanks, Alaska, the hogs to be fed small, unmerchantable potatoes which form an important crop there.

C. E. Williams of Sutter county has been appointed as agent for the representative of the Italian government to secure horses in that county for inspection.

A carload of horses was recently purchased in Alameda county by Hayes Bros. of Imperial Valley, who are said to be agents of the French Government.

Several head of purebred livestock from Ohio and Iowa and some Clydesdale horses from British Columbia will shortly be placed on the farm of the Washington State College.

In order to fight hog cholera and generally improve the condition of the swine industry in Madera county, the various farm bureaus are rapidly organizing swine breeders' associations.

A total of $4,000 is said to have been left in the vicinity of Fallon, Nevada, as a result of purchases made recently of horses and mules by one buyer from the French and English governments.

The Farm Adviser of Yolo county gets first-class hog cholera serum from Iowa at less cost for what is claimed to be better quality than he could get at the University of California.

MISCELLANEOUS.

A. B. Humphreys, breeder of Berkshire and Guernsey cattle, has removed his stock from his ranch at Mayhews to his property near Escalon.

The French Government has made arrangements with England to supply 231,107 tons of frozen meat between February, 1915, and February, 1916.

That the livestock industry is making rapid gains in the State of Queensland, Australia, is shown by the following figures: At the end of 1913 there were 707,265 horses, an increase of 32,692 over 1912; 5,322,033 cattle, an increase of 11,148; 21,786,600 sheep, a gain of 1,476,564; and 140,045 pigs, a decrease of 3,650.

What Yolo county boosters call the $50,000 bull calf will be shown at the Panama-Pacific Exposition. His dam is Tillie Alcartra, recently the world record cow, while his sire is Segis Pontiac de Kol Burke, whose dam is Riverside Sadie de Kol Burke. This makes him the offspring of two cows whose records average over 29,000 pounds of milk in a year, the only calf of such heavy producing ancestry in the world. He was dropped March 22, 1915, and is a beautiful example of vigorous calfhood.

Receipts at the Portland Union Stock Yards for the week ending July 19 were: Less than a thousand head of cattle; 2700 hogs; and 1200 sheep. In the cattle market, cow stuff took a top price of $5.75; steers $6.00 to $6.50; and a nice bunch of Southern grass-fed steers went at $7.00. The bulk of the hog sales went around $7.40 to $7.45. No change in prices were quoted in the sheep market on account of the small number received, though all lines are quoted steady.

Ration for Weaned Pigs.

To the Editor: What is a good ration for weaned pigs, with rolled barley, molasses, and alfalfa at hand? Some of my pigs lost their mother at two weeks old and were put with other sows, but they do not get the nourishment they should—barely an existence. What feed should I give them? What is the hog feed value of Muir peaches? Will all sized hogs do well on them? —B. L. B., Modesto.

[Answered by E. C. Voorhies, University Farm.]

[A very good ration for weaned pigs can be made from alfalfa hay, barley and molasses. Probably the best way to feed these ingredients would be to soak the barley in water and mix the finely chopped or ground alfalfa hay and molasses with it. If a good quality of alfalfa hay is available a ration may be mixed as follows: Three parts of barley and one part each of alfalfa and molasses, by weight. As much of this should be given in a slop with water as the pigs will clean up readily. The slop can be made thicker as the pigs grow older. A ration can be composed of the barley and the molasses in the same way as above, and alfalfa hay fed in racks.

When pigs lose their mothers at about two weeks old, it is probably best to take a sow that is just about to wean her litter and put the pigs on her. After the sow's own pigs are taken away she should be left alone for three or four hours and she will gradually wish to be nursed. At this time she will take the orphan pigs very readily and usually no trouble will result. This is usually the best way to feed such pigs.

It is impossible for us at the present time to give any definite information with regard to the feeding value of Muir peaches for hogs. It is, however, very probable that they should be handled as a great many hog growers do. They allow the hogs to run in under the trees and pick up what they like. It is advisable to feed some grain along with peaches in order to keep them in a vigorous and growing condition. They are liable to injure the trees by rubbing, but this can be avoided by driving three stakes around each tree.]

COTTONSEED MEAL AND ALFALFA.

[Written for Pacific Rural Press by E. C. Voorhies, University Farm.]

Cottonseed meal is a valuable feed when rightly used. In most sections of the country it is our highest protein feed and the cheapest source of protein for stock feeding. It is an excellent feed for milch cows and may be fed in large quantities (six pounds per head daily), apparently for any length of time; ordinarily only one to two pounds per head is fed daily with other concentrates; and this is, in general, the better practice, since heavy feeding of cottonseed meal gives the butter a hard, tallowy texture and raises the melting point of the butter fat, and decreases the percentage of volatile fatty acids,—in short, produces a low grade butter.

Cottonseed meal cannot be safely fed to calves or pigs, owing to the presence of poisonous principles in the meal. Recent investigations in the North Carolina station appear to show that the danger in feeding cottonseed meal to pigs can he overcome by giving them in their drinking water, for every pound of cottonseed meal eaten, for each 100 lb. pig, one gallon of a solution of iron sulphate made by dissolving one pound in fifty gallons of drinking water. No investigations have been made with the feeding of the iron sulphate in this State.

Wetting Alfalfa.—It is the practice in quite a few dairies to sprinkle alfalfa hay with water when it is being fed to allay the dust. We are not aware of any harm that has come from this practice, as it is still being done in some of our dairies.

LICENSE SERUM PRODUCERS

[Written for Pacific Rural Press.]

Among the new laws which will go into effect at an early date is one to regulate the manufacture and sale of hog cholera serum, vaccine, virus, or antitoxin. The law provides that all such plants must be licensed and be subject to the supervision of the Director of the Experiment Station at the University of Califorina. The Regents of the University are authorized to collect a license tax of one mill for every cubic centimeter of serum, vaccine, virus, or antitoxin sold or distributed. The law was proposed to protect swine raisers against manufacturers who prepared any of the above products in an insanitary manner, thus jeopardizing the swine industry of the State.

HOW ONE STALLION MADE GOOD.

[Written for Pacific Rural Press.]

The saying that "A prophet is without honor in his own country" applies in a way to a fine Belgian stallion which is being used in one section of the State.

Some three years ago, this horse was sold to two brothers, the stallion at that time being young and in the pink of condition as most stallions are when offered for sale.

The brothers developed more of a fondness for John Barleycorn than they did for the proper care of their horse and besides blinding him in one eye with a pitchfork while in a fit of anger, decided that money spent for bad whiskey was better than for horse feed with the result that the horse became so poor in body that he no longer commanded the respect of mare owners.

Last winter the horse's former owner came around to collect some of the money owing on the horse, but instead of getting any he found the brothers broke and the horse in deplorable condition. Again assuming ownership of him, the salesman sold him to another farmer in the vicinity for $500 with the understanding that he could have four years to pay for him and nothing down.

The new owner took the horse home and immediately began to feed and care for him, with the result that when the spring season commenced, the horse was back to normal condition except for his one eye.

The insurance fee for mares was set at $25 and the mare owners who previously refused to breed to him have changed their minds to such an extent that the horse has had all of the work he could do all season and will pay for himself this year. His new owner says that he makes a fine farm work horse when not in use for breeding purposes and thinks he has the laugh on many an older farmer who saw lack of flesh rather than quality of bone and conformation in the stallion. Many a good stallion's services are lost to the State for lack of flesh and bloom. This defect should be bred out of our horse selling and buying system.

SWEET POTATOES THROUGH MARCH.

To the Editor: We planted about 200 sweet potato plants in the spring of 1914 and dug about 400 pounds of potatoes. We were told they would not keep long so we sold most of them.

For potatoes for home use, we secured real dry river sand and buried them in sand in a barrel, first putting in a layer of sand, then a layer of sweet potatoes, not touching each other. We used as we needed them and found a few rotted. On Mar. 29, we emptied the barrel and found about a bucket full of as fine potatoes as one could wish.

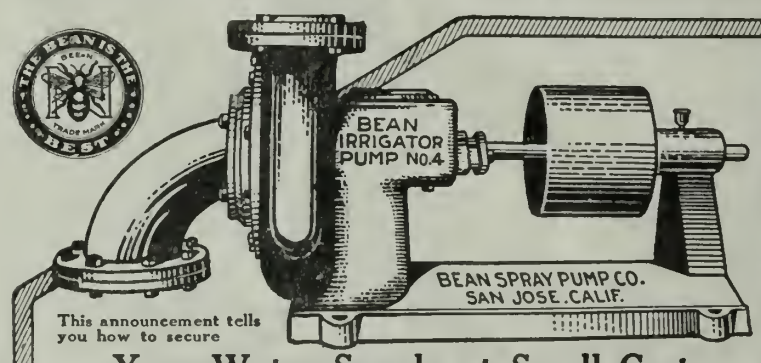
"DOG DAYS" the best time to buy a DE LAVAL SEPARATOR

THERE was never before as good a time to buy a De Laval Cream Separator as **right now.**

The "Dog Days" are at hand when dairying is most difficult without a separator and when the increase in quantity and improvement in quality of cream and butter are greatest through the use of a good separator.

Then there is the great saving of time and labor, which counts for more in summer than at any other season and often alone saves the cost of the separator, aside from all its other advantages.



This is likewise the season when De Laval superiority counts for most over other separators,—in closer skimming, larger capacity easier running, easier handling, easier cleaning and absolute sanitariness.

A De Laval Cream Separator bought now will easily save its cost before the end of the year, and it may be bought for cash or on such liberal terms as to actually pay for itself.

Mixing Cow Feed Thoroughly.

[Written for Pacific Rural Press.]

"A cow ration is needed simply to keep the cows in good condition," said a dairyman of high standing. He was feeding purebred cows a ration made by mixing 200 pounds of ground mixed barley and oats grown together, 100 pounds bran, 100 pounds fine ground corn. The heavy milkers receive about a pound of this mixture per five pounds of milk. When the milk fell below 25 pounds a day, the ground feed was withdrawn and the cows dried up.

Heavy milkers need concentrates because they can't hold enough alfalfa to make the 60 pounds of milk a day which many cows average early in lactation. Alfalfa, however, is fed as much as the cows want.

Mangels also are fed all winter, the Golden Tankard and Red Mangels being used mostly. The Reds are larger, but the Golden Tankards more solid. These mangels are left in the ground until ready to be used because they keep much better that way.

Cows are not turned onto pasture at all because it is a waste of valuable land, and because there is not always feed or water enough handy. In such cases, the cows must be driven to grass and to water; and especially during hot weather, the milk fails on this account. Cows drink more water if it is "under their noses," and this is the only legitimate way of watering the milk.

Mixing the concentrates is simple, but seldom done right. This dairyman has to teach the mixers how to use it. Each different kind of feed is spread out on a smooth floor, one kind on top of the other in a broad, shallow pile. Then it is turned over by running shovels along the floor under the outer edges and turning each shovelful entirely over so that there is always an open space between the unmixed and the mixed feed, finishing as a hollow circle of mixed feed. It is then turned back to the center in the same way, always running the shovel along the floor, and finally turned a third time, when it is a uniform enough mixture so that each cow gets the same ration as the rest and the same ration every day. This is very conveniently carried down the center aisle between the cows in a cart balanced on two wheels.

WALLING-OUT GOPHERS.

To the Editor: Have any of your readers any practical method to suggest for keeping gophers out of alfalfa? I have between three and four acres in alfalfa which has been planted for five years. I am forced to rely on a sprinkling system with network of pipes as the land is gravelly and porous and it is impossible to flood to drown the pests. I have had a fairly good stand each year and make about five cuttings—but in spite of cats and traps the alfalfa is riddled with gopher holes, which are getting worse each year and destroying the roots. I have thought of a proposition to put a rock and cement wall around the alfalfa field going four to six feet deep and two feet above ground. Can gophers go deeper than this? There is plenty of rock on the place and cement is not so expensive if we do the work ourselves. Has this ever been tried?—An Old Subscriber, Los Gatos.

[You will surely gain no gophers to speak of from the outside if you build such a wall, but it will be fiercely expensive in digging and masonry even if you do all the work yourself. Gophers do not go as deep as four or six feet unless they choose to dig wells and they have such juicy food that they can get along without wells better than squirels probably. We cannot find record of any extreme depth found by those who have studied burrows by abundant excavation, but they are said by all investigators to be shallow and only a little deeper for housing purposes. Our opinion is that few if any would dig under a wall half the depth you mention. They do surface running at night, but common opinion is that a one-foot barrier would stop that. We therefore believe if you build one foot above ground and two feet below you will practically have them shut out. If any readers know differently we shall be glad to hear it.

You can also protect your place very largely by digging a ditch with vertical sides two feet deep all around it and keeping that ditch open. Dig the width of a coal oil can and bury cans even with the bottom of the ditch at intervals of 25 feet. Digging gophers will take headers into the ditch, run along the bottom of it until they plump into the oil cans, from which they cannot climb out. Such pitfalls have been considerably used and captures of gophers by the hundred have been reported. Cats have also been seen to help themselves from the cans—so you can have a combined ditch, can and cat system which will work automatically. If in addition to this protection you get the knack of using traps to catch those now inside the patch, you may get a little rest and more alfalfa.—Editors.]

MORNING GLORIES AGAIN.

To the Editor: How can we get rid of wild morning glories? They are taking the place; have plowed them under, still they come up. Grow mostly around the fruit trees. —E. S., Grass Valley.

[The best way we have found to get rid of morning glory among fruit trees is to plant alfalfa thickly and then keep it watered so it will not rob the trees. But we have seen orchards in which sections planted to alfalfa showed marked inferiority to the rest simply for lack of water. If water is unavailable, lay seige to the underground root stocks by which morning glories mostly outlive attacks. Rigid blockade of their food supplies by hoeing off the vines whenever they appear above ground, will eventually starve them into decease.—Editors.]

STOCK NOTES.

[From College of Agriculture, University of Arizona.]

How Many Sheep Per Acre?—Regarding the acreage of alfalfa required to feed a band of sheep, it would seem that seven lambs could be fed five months on each acre. The basis for this estimate is secured from the amount of hay required for feeding sheep and an estimated yield of about five tons of alfalfa hay per acre. It is possible that you have a heavier crop of alfalfa and that you could carry more animals, but I would place 14 as the maximum from May to October 1st.

Bot Fly Habits. — The sheep bot fly or grub in the head is caused by the gad fly's laying eggs, which soon develop into larvae and enter the cavities of the head where they develop, causing considerable annoyance to the sheep. The fly works from June to September and the larvae require some months to develop, so that you need not worry about them if you are able to secure sheep that are not affected.

Alfalfa for Pigs.—Alfalfa pasture makes an excellent food for growing pigs. It is estimated that seven pigs averaging 100 pounds can be maintained on an acre of alfalfa the year around, 12 to 15 during the summer only. It should be remembered, however, that alfalfa is too bulky for making good growth or fattening pigs and should be supplemented by concentrated feeds such as milo maize, corn, barley or shorts. It is not recommended to feed bran in conjunction with alfalfa hay as these feeds are very similar in composition and digestibility as well as in bulkiness.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

POULTRY TO KEEP GIRLS ON FARM.

Poultry farming is getting to be the modern way of keeping boys and girls on the farm. Diversified farming brings in cash during all seasons of the year, and the poultry side of the diversified farm pays in cash and a contented family.

The poultry side of farming calls for tact, industry, and good business sense. It is not a business for the dreamer; to succeed, the poultry farmer must keep his weather eye open at all times, not only keep it open, but keep it going over all things and conditions. If he does not, he will soon be one of those who put money into poultry instead of taking it out of poultry.

To get money out of poultry one should have something to sell all the time; keep up a constant circulation and that keeps life in the business. The "blood may be the life"; but if it does not circulate, it's dead, and that is the way with the profits from poultry; if the circulation stops, the profits stop, and the business is dead. It is the poultryman's business to keep it moving, and the farmer who has a little ground to grow his own green feed can keep it moving pretty strong, if he uses judgment and is industrious. There are so many ways of doing this, especially if he happens to live near a city, that it almost looks needless for me to point out any particular ones.

A motorcycle may be used to drum up trade in a near town as mentioned on another page.

Selling Parcels Post.—The parcel post may be used for delivery if no other mode of delivery is handy, though in this case the shipper would have to be at some trouble in correspondence. I would like to see the parcels post on the same footing as the express companies so that the shipper could send C. O. D.

This would be a great advantage to the poultry farmer and purchaser both; it would save all guess work regarding weights, etc. If a customer ordered a chicken and stated what weight, about, and the chicken weighed, say, half a pound over, the parcels post weight would be satisfactory and he could pay on delivery. We are surely big enough a nation to have a full-sized parcels post, and taking it for granted that we have a Poultry Commissioner now, let us all whoop her up for a bigger and better parcels post.

Anything that helps the farmer helps the country at large, and if the farmer had not been too blamed independent in the past we all might have had better systems of marketing our produce than we have now. But we are improving in all ways on the farm, work is more evenly distributed, as a rule, though there are some of the old stock quite hidebound yet.

One thing is sure, though, if the poultry farmer is hide bound his pocket book will suffer. Up to date methods of business must be practiced or you fall behind in the procession.

Poultry to Keep Young Folks on the Farm.—The young folks of today need a business education before going adrift in the world and there is no more practical way of giving them one than to start them up in a business of their own. A few good fowls and a plot of ground turn the trick, and your boy or girl will learn more real business by conducting it themselves than they will by studying books. Every boy and girl is a natural trader; it's born with them, or why do they start shop with a bucket of sand and a few pieces of treasured paper they sneaked out when mother was not watching?

I know a girl that was bound she would leave home to work in the packing houses; she wanted money that she could call her own; and if she spent it foolishly no one would be the loser but herself. Her mother being a sensible woman took my advice and bought the girl some turkeys. Now she is the most contented girl, happy and cheerful all day long, because she has something to interest her both physically and financially. She is making money, because she seems to have a knack for selling at the right time.

That is one feature of the poultry business we don't all have—the knack of knowing just when to let go and when to hold on. And sometimes this is the dividing line between profit and loss. It requires judgment and a keeping in touch with the cost of feed, market prices, and local demands. A few drones soon eat the honey the workers have made so that this is one feature of the business of poultry farming that must be acquired if we are to make a profit. Watching the leaks, that in themselves do not amount to much, yet when let run into many little driblets soon make a stream of no small size, is all a part of the business, always remembering that it is easy to put money into a business, but requires ability to take money out.

FALL HATCHING.

It seems to me that the question of fall hatching needs more light. I have several times written on this subject during the past years, but found that very few became interested, except the large poultry ranches. They do, most of them, arrange so as to get out one good hatch about October.

Mr. Croley apears to think I am opposed to fall hatching, but that is not so; I merely gave the principal reasons why breeders do not advertise fall hatched chicks. And the reasons are, of course, based on profit. When eggs are running from thirty to forty cents a dozen it does not stand to reason that the hatcher can sell chicks much under double the price he sells for when eggs are twenty to twenty-five cents a dozen. I have hatched and raised chicks in every month of the year, but I much prefer some months to others.

Chicks Grow Faster.—Now in regard to the growing of fall chicks, if they are given proper care and shelter I think growth is really faster than at some other seasons. One reason is that, as a rule, they are sure of plenty of tender green feed, for the fall and winter months are the best growing seasons for orchard grass and vegetables. Also I believe the chicks can be raised at less expense, because during those early winter months the grain and mill products are usually a little cheaper. This naturally offsets the extra price paid for chicks or eggs and one evens up the other. But in localities where heavy fall and winter rains come, the chicks must be kept indoors or wet feet are liable to bring cold and roup.

It is simply a matter of preparedness. I hatched chicks one year in Sonoma county in December and raised them in outdoor brooders of home manufacture. But I would not advise anybody else to "go and do likewise," for that was a chore I never wanted again. Along in the night I would hear the patter on the shingles, and although I had left the chicks safe for the night, I could not believe they were safe unless I went out to see. And sometimes it got to be nearly a case of swimming to those chicks, but I always went.

Make Good Layers.—In my opinion the one great feature, and I think it is the only feature, about late hatching that is really worth considering, is this: By hatching during September and October you get eggs from hens that are proven good layers; the poor layers have quit the game and are using up their energy to make feathers, while the best layers are just laying eggs and putting in a little of the surplus to feathers. Now this is the only sure method of building up a winter-laying strain of pullets.

When fall comes those pullets and hens, after about three generations, will naturally get down to laying because they have lost the seasons. They are like a mariner without a compass; they get turned around and decide that its spring anyway. And to get chicks from hens that have been bred into the winter laying habit is really the only excuse for fall hatching; otherwise the profit is only on a par, considering price of chicks, with spring or summer hatched chicks.

Give Chicks Good Care.—There is just one thing to remember in fall hatching: that unless the chicks are given good care they will not attain the size spring chicks do, because the growing season is shorter owing to early maturity. Geo. Northrupp, the big Minorca breeder, says he prefers to hatch Minorcas for profit during July, August, and September. He claims the gain in maturity is over two months and that they grow better during August and the early fall months than in the spring. This statement requires a little stretch of the imagination because nobody can fool nature quite so easily, and spring is nature's growing season. Even babies born in the spring months grow easier than those born at other seasons. But it is a fact that all breeds of poultry can be brought to earlier maturity by fall hatching, though it is often, as stated before, at the cost of size.

When we start in to investigate a thing it should be looked at from all sides; it is very easy to create a little enthusiasm on any subject, but it is not everybody that can piece a thing together and analyze it in parts.

Providing the right man or woman gets good fall-hatched chicks and is

California Poultry Practice

Written to Teach Better Poultry Methods on the Farm.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poutry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers

HOPLAND STOCK FARM
HOPLAND, CAL.

Standard Bred S. C. White Leghorn Cockerels, selected for Breeders. **Four months old, $12 per dozen; Yearling Hens, $12 per dozen.** Standard Bred White Plymouth Rock, Fishel and Owen Farm Strains **Direct.** Hens one and two years old $18 to $24 per dozen. Four to five months old pullets, $18 per dozen. Selected Cockerels and Cock Birds, $5 each and up.

prepared to shelter them right, they need not fear not coming out even; but if they are just going to raise them haphazard they will be money in pocket to leave them alone. Leghorns hatched in September will commence to lay in March without any special effort, if they are fed right and sheltered right all the time; Minorcas, I should judge, will commence in late March or April, and once they start will keep it up as long as they are fed for it. They will molt early and get down to laying again before the rest of the hens think about it, or they will follow the example of the hens they came from and lay late in the fall without molting. The latter is the more natural method for them and if fed right it is exactly what they will do, but change of feed, of environment, and many other things sometimes change the natural course of things and stops hens laying for a few days, thereby changing conditions.

One other idea comes to mind and that is that the cockerels even of Leghorns are a welcome addition to the market caterer coming at a time when there are few to compete, hence the price has been known to run as high as thirty-five to forty cents a pound.

Hatch Chicks This Fall.

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n of California.]

The number of letters and inquiries we are receiving indicate that fall hatching is being considered by a very large number of poultry keepers who have never attempted it in the past.

Clarence Johnson states that he has been very much pleased with results from fall hatching of Plymouth Rock chicks, but has been able to set only a few eggs at the time owing to the difficulty he had to get eggs in the fall from the greater part of his flock; only the most gentle hens could be depended on to lay at that season and there were only a very few tame hens in the lot. He wants to know how to get more eggs in the fall.

As Plymouth Rocks are naturally inclined to be gentle and tame, Mr. Johnson's fowls were evidently raised under conditions that developed unusual nervousness and a disposition to be wild or suspicious, and easily frightened.

Fright Stops Egg Development. — It is absolutely necessary to always keep domestic fowls gentle and tame if an abundant egg yield is expected at any season and this applies with greater force in the fall than in the early spring. When subjected to fright or any unusual disturbance, the laying hen is checked almost at once. The fright and excitement not only checks the completion of eggs just forming, but actually causes the hen's systems to absorb partially completed eggs. This disturbance usually sets back the forming and laying of the first egg of a new series for a period of a few days to several weeks. Is it any wonder that some well-fed hens, bred from heavy laying strains, produce a limited number of eggs during the year and only a very few or none at all in the fall?

Scared Chicks Become Eggless Hens. — We recently received a report regarding a poultry farm that had been unprofitable. It was well planned, provided with good houses and stocked with chicks selected from heavy laying and vigorous strains. As chicks and matured fowls, they were given sufficient attention and ample and proper feed, still the egg yield was so poor the plant was run at a loss.

The only real cause for the lack of eggs was the disposition of the fowls. They were nervous and suspicious, expecting trouble at all times. They scooted for a hiding place when a small bird flew over the yards, or the wind disturbed a few dry leaves, and even on the approach of their keeper.

On inquiry, it seems this keeper was very proud of the manner in which he could "boss" his little chicks and cause them to go into the brooders in the evening and during the day when he wanted them out of his way when entering the brooding house to clean, feed, or water. He would wave his hat in the air and let out a war-whoop which sent them racing into the brooders, where they hovered in fright until he disappeared. It is practically impossible to raise a gentle hen from a chick treated in this manner. This man evidently missed his calling; he would make a star performer in a Wild West show or a good captain of a Jack rabbit drive.

Gentle Leghorns' High Average.— We also have a report from Chas. Blom, who has had many years of experience with fowls at Napa and strives to keep them gentle. He is highly pleased with an importation of White Leghorns from Tom Barron. Mr. Blom says in part: "The six hens and two cockerels arrived October 3, 1914; the first egg was laid Oct. 17. One hen died the last of November after laying 17 eggs and the remaining five laid up to July 20, 707 eggs in nine months, an average of 141 eggs each. Of this number, 95 were produced in November.

"Another good feature is the gentleness and good behaviour of the fowls. Even the males are easily cared for. I have males of various ages running together in one enclosure, but there is scarcely any scrapping. We trap-nested a pen of pullets hatched last winter from eggs laid by these five Barron hens. Eight of these pullets, in the 50 days from June 1 to July 20, laid the following number of eggs: 44, 41, 39, 38, 35, 35, 34, and 33."

Mr. Blom's experience emphasizes the importance of keeping the hens gentle and tame, and proves that fall-hatched pullets are excellent egg producers.

TURKEY RAISING.

To the Editor: I find it best to use chicken hens for turkey eggs. I have the best luck with Buff Orpington hens, but any large quiet breed is good. I usually put six to eight eggs under each one; and as soon as hatched keep them where nothing can trouble them. They do best in a grain field or high weeds. Have coops or a box to roost in. Keep them clean and warm. I usually set mine about June 1. They can't stand the cold, and if too many are under one hen, they crowd and smother. The first week I give them twice a day one hard boiled egg rubbed together with as much corn meal as it will take up for six—plenty of chopped greens all the time. From that time on I just give curd mixed with coarser corn meal, only as much as they will clean up at once. After that they are no trouble. When they are about a week old the lower wing feathers fill with blood and have to be pulled out; that takes their strength and causes them to droop.—Mrs. F. S. C.

LAND FOR SALE.

FOR SALE OR EXCHANGE—About 24 acres deep rich, sandy loam, all in solid alfalfa, now producing heavy crops, age considered. 20 acres were seeded last fall, the balance this spring. Good stand. Most of this land was in alfalfa some years ago, and for several years produced 8 to 12 tons dry hay per acre each year, scale weight. The checking being faulty, it was plowed up and has been strip-checked in first-class shape. Boxes are large with 6-foot gates. Main lateral is the boundary on two sides, with 2 service gates on the land. Has just been perfectly irrigated in 8½ hours' time. Has a beautiful building site on a main road 1 mile from main state highway, and 1½ miles from a rapidly growing town. Will sell cheap on easy terms, or will exchange my equity of about $3,500.00 for good cows or young stock at a fair valuation. Balance bank mortgage can remain your own time. Give full particulars in first letter. Address Box 175, Pacific Rural Press.

CALIFORNIA LAND—Money-making little farms. High-class, low-priced in all counties. First mortgage loan on farms bearing 7 to 9 per cent. Call or write the oldest land office in California. C. M. Wooster Co., 303 Phelan Bldg., S. F. Catalog free.

FOR SALE—Small ranch. Sacramento Valley. Buildings, Alfalfa, Irrigation ditch. Cows. Hogs. Reasonable terms. Slater, owner, Hobart Bldg., San Francisco.

CITRUS LANDS FOR SALE at one-half its value, near Lemon Cove and the famous Merryman ranch, on electric line. For description and price, write or call on A. G. Griswold, Exeter, Cal.

STOCK RANCHES for sale in Eastern Oregon. Principal only need apply. 2509 Prince St., Berkeely, Cal

KATIE'S ANSWER.

Och! me Katie's a rogue, it is thrue,
But her eyes, like the skies, are so blue,
An' her dimples so swate,
An' her ankles so nate,
Shure she dazed an' she bothered me, too.

Till one morning we went for a ride,
Whin, demure as a bride, by me side,
Like a darlint she sat,
With the wickedest hat
'Neath a purty girl's chin ever tied.

An' me heart, arrah, thin, how it bate!
For me Kate looked so tempting an' swate!
With cheeks like the roses,
An' all the red posies
Ye'ud see in her gardin' so nate.

But I sat jist as mute as the dead,
Till she said, wid a toss of her head,
"If I'd known that today
Ye'd have nothing to say,
I'd have gone wid me coosin instead."

Thin I filt meself grow very bowld,
For I knew she'd not scold if I told
Uv the love at me heart,
That ud niver depart
Though I lived to be wrinkled and owld.

An' I said: "If I dared to do so,
I'd let go of the baste an' I'd throw
Both me arms round yer waist,
An' be stalin' a taste
Uv thim lips that are coaxin' me so."

Thin she blushed a more illigant red,
As she said, without raisin' her head,
An' her eyes lookin' down
'Neath their lashes so brown,
"'Ud ye like me to dhrive, Mister Ted?"

—Judge.

SOLOMON AT ALKIRE RANCH.

[Written for Pacific Rural Press by Geo. A. Alkire, Glendale, Ariz.]

Like most folks, we admired pea fowls and had to have one, so awaited our time till Old Solomon and his wife the Queen of Sheba came along. They were a fine pair in every way.

We kept them shut up for about a week, according to instructions. After being let out, Old Solomon took his wife and inspected the place thoroughly, calling on the neighbors. The first place he hit was where an Irish policeman lived on sick leave, who had been raised in the city and was not acquainted with country life. Solomon flew up an umbrella tree and let out a few calls; and, of course, all the chickens and feathered flocks fled under cover and stayed there. The policeman came out; and thinking it was a hawk, got his pistol and shot Solomon, breaking one leg and a wing. He brought him home—a sorry object; but we patched him up and after a time he was as good as new. He had a rather "step and go fetch it" gait, as a result; but he never ran off again.

When the new chickens began to come, he was a regular torment, pecking the hens, quarreling with the setters, taking the little chickens up in his beak, and whirling them around. Wife got on the warpath once, and grabbing a buggy whip stood on his tail and gave him what he needed. After that, he was a good bird among the chickens.

He would strut around and show off his plumage to the guineas, turkeys, mules, horses, cows, and all the corral folks. He was a constant terror to the mules in harness and teams that came in from the outside. Then along in August when his plumage started to fall out, we would catch him and pull the feathers; and he was so ashamed of himself that he was conspicuous by his absence, only coming into view to eat or drink. However, the new feathers soon made their appearance and he was busy fixing and working at them until they were all out again.

During the time the Queen was laying and setting, he was so busy strutting that he was very much entertained. But when she hatched out the young poults Old Solomon was wild. He ran all over the ranch, calling, spouting, fighting all the dogs and cats he could get at, and acting as if he was the "onliest" daddy on earth. However, the excitement wore off in about a week, and then he went back to his strutting again. Callers at the ranch were his special delight, and he was the source of much envy from the ladies that visited the place. At times it looked as if his plumage would be wrecked, but we managed to have a few feathers on hand most of the time to supply their vanities.

The feathers were a means of revenue; some people who visited would often write for feathers to trim their hats and clothes. The young have also been a means of income to us, finding ready sale at $10 to $15 per pair. Many times they wanted Solomon, but he was one thing that we would not sell—he was part of us.

The night was never too late or too stormy for him to greet us with a "Yeow Moo" when we were getting home; he was always interested in everything that was going on, or new or strange things moving on the ranch; and a stray dog among the sheep was a very serious affair. He would keep up his alarms until someone made an appearance; then his duty was done and he would shut up. A fish stranded in the irrigating ditch was the source of greatest concern to him, and he never got used to things being in the water.

He had some notions of his own; would get in a mix-up with the guineas and would fight as many as fifteen at one time. He surely was busy while it was going on, but usually gave them all they were looking for before they got through. Some of the younger turkey gobblers would take a whirl at him, and then there was something doing. They soon got enough of his sure, sharp beak; and his aim was so true they got a mighty bloody head and a good drubbing. One good peck soon satisfied the ganders that Solomon meant what he remarked about them, and they were very respectful after that. He seldom mixed with the young pea fowls; was a hermit in habits; though he would show them how to strut and preen their feathers.

When a bright plow was brought in from the field, he would spend hours fighting that other pea fowl; and a new milk can was much worry. He would walk miles around it until some one would take pity and put an old sack over it and save his energies.

He took his food where he found it; he always knew where the best corn, wheat, or milo maize came in, and we could rely on his judgment as to when it was cured right. He would pick it over and if it was not up to his standard, he would shake his head and walk off with such a "don't care," discouraged look that 'twas always worth going some ways to see.

When he had full plumage, he always had some pertinent remark about the condition of the weather; and was a pretty good prophet withal, though sometimes slow with his rain talk.

He always knew where the early

Make Old Buildings New

by covering roofs and sides with RU-BER-OID. The illustration above shows old barns and sheds on the George Mixter farm, Hardwick, Mass., made weatherproof and as attractive as when new by the application of RU-BER-OID on the roof and to cover the outside walls. This work—done years ago—put an immediate end to repair bills on these buildings. It helps protect them from fire and it keeps the stock warm in winter and cool in summer.

You can make your old farm buildings more attractive, and at the same time add many years to their life by covering them with

Pronounced "RU" as in RUBY

RU-BER-OID ROOFING

COSTS MORE - WEARS LONGER

RU-BER-OID was the first pliable, ready-to-lay roofing. It has been made under the supervision of expert chemists from the *same* formula for 23 years. It costs more than ordinary prepared roofings, but it is *worth* more. Its durability is proved by the fact that hundreds of buildings roofed with RU-BER-OID *more than 20 years ago* are still water-tight. RU-BER-OID is therefore *cheaper by the year.*

RU-BER-OID Roofing is always made of a dense, durable felt, free from wood fibres, paper stock, sand, coal tar or asphaltum oils.

For Your Home you want a roofing that will look well and wear well—a roofing that cannot warp, rust, rot or crack—a roofing that will help to keep your family comfortable in all extremes of weather. RU-BER-OID meets your requirements.

For Your Barn you want a roofing that requires no repairs—a roofing that you can apply quickly and economically, and one that has *proved* its durability by more than 20 years service in all parts of the world. That roofing is RU-BER-OID.

For Small Buildings —sheds, poultry houses, etc., you want a *durable* roofing that is *permanently* weather-proofed—a roofing that will not begin to crack and leak after a few years' wear. Roof with RU-BER-OID and be safe.

Look for the RU-BER-OID Man

The "Ru-ber-oid Man" shown at the left appears on every roll of RU-BER-OID Roofing. If the Ru-ber-oid Man is not there, the roofing is *not* RU-BER-OID.

The United States Appellate Court, October Term, 1914, enjoined manufacturers of imitations from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing.

Colored RU-BER-OID (Ka-lor-oid)

—made in Tile Red and Copper Green, possesses all the long wearing qualities of the gray RU-BER-OID. These attractive colors are permanent—*built into* the roofing

figs came in and got about as many as we did of the first crop. The later ones he did not care for. He selected the finest peaches and plums, and apricots were his joy. He was a good sampler, but always had such a dignity about it that one enjoyed him even if he did destroy some of the best fruit.

Strange dogs were a terror to him, and he always set up a trumpeting as soon as he spied one; and kept it up until they left. He joined in all the cat fights and was a leader for the chorus.

He had one special place to roost—on a high beam over the horse lot; and he was always at home after dark there. Sometimes a mischievous mule would try and browse off his plumage, then he would get up on the barn for a time.

In his later years he was slow about getting up in the morning; in winter he would get up on his perch some days till about ten o'clock, all humped up like an old rheumatic man until the sun came out good and strong, then he would get down and walk around so stiff and comical.

One of the mules had a playful streak the other day and struck him on the back. The poor fellow gave up the fight of life; he was fifteen years old, and we miss him much. One of our old friends has gone on.

WASTE WATER.

I frequently see on the places I visit in the country, that the water from the kitchen sink is allowed to run into an open drain and over the ground, making a foul-smelling mud-hole, and as is frequently the case, in danger of seeping into the well, which is usually close to the house.

We run our kitchen waste into a large barrel to which is attached a siphon made of one inch galvanized gaspipe. The siphon empties into a V trough, and is led to the vegetable garden, where the water spreads over the ground and is quickly absorbed. As the siphon acts automatically when the barrel fills up to the top, the barrelful is discharged every few days instead of every few hours or minutes, so that the ground does not become tainted if raked or forked over when dry.

I have also fitted the water trough in cattle yard with an automatic device consisting of a float, stop cock, and siphon, outside the yard, so that the animals cannot throw it out of gear. The object in having the siphon attachment is so that the trough can be tipped over and thoroughly cleaned out occasionally. Before I put this device in, the horses or cows would knock something out of line and the water would run over and flood the yard, and frequently empty the big tank before it was noticed. Now it fills up as the animals lower the water level of trough in the yard and requires no attention.—S. H., San Jose.

VEGETABLE COOKING RECIPES.

Cheese in Pepper Shells.—Scorch the peppers slightly in a quick oven or on a broiler over the coals; remove the skins; split with one careful gash; and remove seeds. Insert in each pepper a little ball of rather dry cottage cheese; fasten the opening closely with tiny toothpicks; dip the peppers in egg and fine crumbs; and fry in deep kettle of fat.

Broiled Peppers. — Quarter the peppers, seed, and remove veins. Broil over hot coals until edges curl. Serve at once with thin, browned slivers of bacon.

Pimento Potatoes. — 6 medium sized potatoes, ½ cup grated cheese, ½ can of pimentos, 1½ cups cream sauce, 3 tablespoons bread crumbs, 2 tablespoons butter, salt and pepper to taste. Boil, cool and slice the potatoes; add chopped pimentos, cheese, salt, and pepper. Turn in a buttered baking dish. Pour over the sauce, sprinkle with bread crumbs; dot with butter, and bake 20 minutes; serve hot.

Canned Peppers.—The peppers should be plump, fully ripe, and red. Cut off tops; take out seeds and white membrane lining. Lay in boiling water for 5 minutes or until skin may be pulled off easily; care should be taken not to break or tear apart. Drain, let cool somewhat, and pack in glass jars. Add one-half teaspoon of salt to each jar of peppers; fill jars with cold water; and place tops on loosely. Put jars in boiler with false bottom; add cold water half way up the jars (adding boiling water as it boils away); let water boil one hour. Remove to back of stove; allow the steam to escape; and close jar tops tight; let cool in water until next day, then repeat heating process, loosening jar tops at start. This is for pints; for quarts, boil a half hour longer on each day's cooking. Keep in a dark place.—Mrs. C. M. G., Dixon.

Pat—"Have ye christened yer new baby yet?"

Mike—"We have."

Pat—"And ph'wat did ye call it?"

Mike—"Hazel."

Pat—"Er'a, glory be to God; 223 saints to name yer kid after and ye had to go and name it after a nut!"—Ex.

"Johnny!" "Yes'm." "Why are you sitting on that boy?' "Why, I"— "Did I not tell you always to count one hundred before you gave way to passion and struck another boy?" "Yes'm, and I'm just sittin' on him so he'll be here when I'm done countin' one hundred."—Sacred Heart Review.

Hot Weather Pests

Ants One of the Most Aggravating Annoyances.

Hot weather means different things to different people, but it always suggests one very disagreeable thing to the housewife—and that is ants.

Ants are small and unassuming but they are busy all the time, and have an unhappy faculty of intruding themselves where they are not desired.

What could be more annoying than to have a mess of ants over-running the food you are about to serve your family or guests?

Women everywhere will hail with delight, therefore, the announcement that a simple remedy has at last been devised that will rid them of this plague forever.

A baker in Los Angeles, after much experimenting, devised a paste which not only drives ants out of a house, but keeps them out thereafter.

So great a demand was immediately created that it was necessary to put up this remedy for general use under the name of Kellogg's Ant Paste—which can be obtained at all modern grocers or druggists. Try a package today and watch the results.

CALIFORNIA POULTRY PRACTICE
By Mrs. Susan Swaysgood.
PACIFIC RURAL PRESS, Publishers.
525 Market Street, San Francisco, Cal.

The Markets.

San Francisco July 28, 1915.

WHEAT.

The wheat market has remained steady here and at other Pacific Coast points. In the east, after a downward movement in the middle of last week, it has advanced slightly and is now about as it was a week ago.

Cal. Club, ctl.	$1.80,	@$1.82½
Forty-fold	1.80	@ 1.85
Northern Bluestem	1.95	@2.00
Northern Club	1.80	@1.82½
Northern Red	1.75	@1.90

BARLEY.

The barley market is firmer again this week with prices showing up from 25 to 50 cents per ton higher for desirable feed and shipping grain. The trend of the speculative market locally has also been upward for several days.

Choice Feed, ctl. ...$1.17½@1.20

OATS.

While there is no change in the price of oats, the situation is firm in symapthy with the upward tendency in other grains.

Red Feed	$1.35@1.45
White	1.45@1.50

CORN.

All grades of corn are very firm this week, yellow grades being particularly strong. Transactions have not been active as stocks are small.

California Yellow	$1.80@1.85
Eastern Yellow	1.85@1.90
Milo Maize	1.75@1.80
Manchurian	1.40@1.60

BEANS.

The bean market has remained about stationary for several weeks; and nobody seems anxious to do business just at present. Advance information on the new crop is generally favorable. The speculative element has not yet manifested itself.

(On wharf.)

Bayos, Cal. per ctl.	$3.50@3.75
Blackeyes	5.50@5.65
Cranberry Beans	3.50@4.00
Horse Beans	2.25@2.75
Small Whites	4.00@4.15
Large Whites	3.75@3.90
Pink	3.15@3.40
Limas	4.00@4.15
Red Kidney	4.90@5.00
Mexican Reds	4.90@5.00

SEEDS.

(Wholesale prices, San Francisco.)

Alfalfa	17½@18½c
Brown Mustard, per lb	...Nominal
Canary	10 @12½c
Hemp	3 @ 3½c
Millet	2½@ 3 c
Timothy	7½@ 8 c

HAY.

Arrivals of hay for the week have been heavy, reaching up to 4800 tons; but as a single shipment to Australia this week amounted to 4000 tons, the net left here from these arrivals was small. The new crop has been moving into the market more freely than heretofore, though the bulk of the receipts are still of the old crop on previous contracts. The new crop so far as it has arrived shows up well, and is beginning to attract the attention of consumers. More active buying is expected to develop for city consumption about the end of the month. Prices are very firm on all lines, and have been advanced more or less on oat and wheat hays. Dealers report considerable of low grade hay seeking this market; but for this the demand is poor. While the price of alfalfa hay has not advanced, the market is strong and present prices are very firmly held. The yield of alfalfa is less than earlier reports indicated.

(On track, San Francisco.)

No. 1 Wheat, per ton.	$11.50@12.50
do. No. 2	8.50@10.00
Barley	8.00@10.00
Tame Oats	8.00@11.50
Wild Oats	6.00@ 8.00
Alfalfa	7.00@10.00
Stock Hay	5.00@ 5.50
Straw, per bale	.40@ .45

FEEDSTUFFS.

The market for feedstuffs seems to have eased off a little this week, notwithstanding the general firmness on whole grains. The weakness in various lines of meals is more pronounced; and in these prices are down about two dollars per ton. Cracked corn, rolled barley and rolled oats are unchanged as to prices.

(Wholesale prices per ton, carload lots, San Francisco.)

Alfalfa Meal, ton	...$14.00@15.00
Alfalfa Molasses Meal per ton	18.00@19.00
Bran, per ton	28.00@29.50
Oilcake Meal	36.00@38.00
Cocoanut Cake or Meal	24.00@27.00
Cracked Corn	41.00@42.00
Middlings	34.00@36.00
Rolled Barley	25.00@26.00
Rolled Oats	33.00@34.00

VEGETABLES.

There have been a number of changes in prices this week; and, as usual at this season, it is hard to tell one day what the prices for the next will be. With increasing supplies, the general tendency is downward. String beans are now quoted as low as one cent, and two and a half cents seems to be about the top price for the best stock. Some extra fine asparagus has sold as high as $1.75. Merced tomatoes are in better supply and are five cents lower all around. River lugs are down twenty-five cents. Eggplant is now selling at a ten-cent advance, and summer squash is scarce and higher. Lima beans are plentiful and are now quoted at five cents for the best.

(Wholesale prices, San Francisco.)

String Beans, lb	1 @2½c
Lima Beans	3 @ 5 c
Celery So., doz.	.50 @75 c
Lettuce, crate	.50@1.00
Asparagus, box	1.00@1.75
Peas, sack	1.25@2.00
Peppers, bell, bx.	60 @75 c
Tomatoes, crt. Merced	25 @35

Eggplant, lug	.65 @85 c
Summer Squash, lug	.50 @75 c
Green Corn, sack	.75@1.50
Okra, crate	.75@1.00

POTATOES AND ONIONS.

Potatoes are moving rather slowly with more supplies coming in all the time. California growers are finding it hard to place their surplus stocks, and the market here seems to be about full of stock at the present prices. Garlic is a little easier, though the top price for the best stock is unchanged.

Burbanks, ctl.	$1.00@1.25
Delta	.85@$1.00
Onions, yellow, sk	.60 @70c
Red, sk	.50 @60c
Bermudas, crate	.85 @90c
Garlic, per lb., new	4½@ 6c

POULTRY.

Though there have been some changes in poultry prices during the week, the market has continued fairly steady all the time, closing the week nearly at the level of a week ago. Arrivals have been normal.

POULTRY.

(Wholesale Prices, San Francisco.)

Live Turkeys, lb.	.15 @17 c

Geese, per pair	2.00@2.50
Ducks, young, lb	.13 @14 c
Old	.12 @13 c
Belgian Hares	7 @ 8 c

BUTTER.

The butter market has been very monotonous this week, without a change from start to finish. A good deal of business has been done at the exchange and sometimes at concessions from the prices quoted but the sessions have closed at the same figures.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	27	27	27	27	27	27
Prime Firsts	25½	25½	25½	25½	25½	25½

EGGS.

Some heavy arrivals of eggs sent the price of extras down to 25 cents early in the week; but a lively demand sent it up again to the highest price in some time. Selected pullets have been weak and are now quoted at 23 cents.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25½	25½	25	25½	25	26
Firsts	21½	21½	21½	21½	21½	21½
Sel. Pul.	24	23½	23½	23½	23	23

CHEESE.

There has not been much business in cheese. Fancy flats are held at 13 cents, with bidders offering 12½. Young Americas are as before.

(S. F. Dairy Exchange prices on flats and Y.A.'s.)

DECIDUOUS FRUITS.

Loganberries and raspberries are scarce now and prices are advancing, while blackberries are in abundant supply and are down as low as $1.50 with the best selling as high as $2.50. The general run of fruits is lower with the advance of the season and more plentiful stocks. Apricots are an exception as the season is drawing to a close with these, and prices are higher. Peaches are selling irregularly according to the supply and the quantity. A drop is expected at any time. Grapes are lower owing to increasing stocks, but they are in good demand and are moving off well.

Loganberries, red	$6.00@8.00
Strawberries, chest	3.00@5.00
Raspberries, chest	8.00@10.00
Blackberries, chest.	1.50@ 2.50

Cantaloupes, crate	.40@1.25
Watermelons, lb	½@1¼c
Grapes, crate, Thompson Seedless	1.25@1.50
Malaga	1.25@1.50

DRIED FRUITS.

New crop apricots are now coming in a little more freely; and a lot of interest is taken in this line. Packers are still quoting about the same figures here; but the market is admittedly firmer and more are being sold at the top quotations than formerly. Advices from some of the growing districts are that as high as 7½ cents is being offered and that growers are holding for 8 cents. There is no movement in prunes at present, though the feeling seems to be a little firmer. Peaches are offering in considerable quantities at the very low figures quoted, with few selling at the top. There is no movement and little interest in other lines. The New York Journal of Commerce says:

Shipments of prunes to Europe have been resumed. Forty-five hundred boxes are now being loaded at New York, and will be sent to England, continuing the export trade, which has been allowed to become somewhat lax during the past ten days. The present shipment consists of 4,500 boxes of old crop California prunes, sizes 40s to 50s and 50s to 60s. The inquiry from foreign markets is said to be increasing, and a renewed interest is seen by the trade in the business with London and the Continent. The distributive demand which is in progress in the New York spot market now is at least equal to if not greater than the usual trade which is in evidence during the latter part of July, according to one of the most important holders in the market of California spot prunes. The prices, however, in spite of the very steady demand which is being made, remain unchanged.

Jobbers in all the large centers of the country are said to have been combing the entire country buying any lots which are offered to them at a concession, and most of these lots are being sent to New York to satisfy the call which is being made. The supplies in New York are well cleaned up, and the smaller sizes of fruits have practically disappeared. Medium sized Californias are the most active in the trade, and are rapidly diminishing in volume.

The best posted people on the existing conditions of the market report that, owing to the lateness of the crop for the coming season due to the continued cold weather, it is believed there will be only a very limited supply of 1915 crop prunes for September shipment, and very scarce for all early fall demands. This situation has had a tendency, it is said, to maintain the strong feeling which persists in the New York spot market.

CITRUS FRUITS.

The eastern auction market has advanced on oranges and is holding its own on lemons. The stock of lemons in storage is being cleaned up and better prices are expected soon. On the New York auction, Monday, July 26th, valencia oranges averaged from $3.65 up to $4.80 per box and lemons brought from $1.35 up to $3.00 per box. Other auction points were about the same as above on that day.

Shipments from southern California for the season to the first of the week were: Oranges 30,006 cars, lemons 5,114 cars.

Oranges and other citrus fruits are neglected in the San Francisco market, transactions having been small for some time. Prices are unchanged.

(Wholesale Prices, San Francisco.)

Oranges, Valencias, bx.	$2.75@3.50
Grapefruit, seedless, box	2.00@2.25
Fancy	2.50@3.00
Lemons, box	1.50@3.50

NUTS.

The trade is now waiting for the new almond prices of the Growers' Exchange, which will probably be out in a few weeks. Meanwhile a little business is being done by packers, who have secured a limited amount of stock and are trying to bear the market. There is nothing doing on the spot, as everything is cleaned up.

(Prices f. o. b. San Francisco.)

SPECIAL DECIDUOUS MARKET REPORT.

By J. L. Nagle.

Sacramento, Cal., July 26, 1915.

Despite the fact that receipts from California have been increasing in the last week and that the shipments from Texas, Arkansas, Georgia and other southeastern states have been heavier than any previous season in the history of the business, all markets have remained remarkably firm in view of these conditions. It is remarkable to think that this immense tonnage of fruit, principally peaches, could be put into consumption day after day. It is true that several cars, both from California and from the Southeast, have sold at prices less than the cost of production, but, naturally, these facts do not develop until the sale is made. It is safe to say that the height of the Eastern peach shipments is now on and California is marketing its heaviest crop of peaches within one week. Whether the market will tumble under increased receipts and heavier offerings is problematical, but fortunately several shippers have gotten under cover and have sold, in remote districts not affected by Eastern competition, several cars of Elbertas at prices that, though not altogether satisfactory, will net the grower a small amount over and above the actual cost.

If the present prices paid for the early shipments of Malagas from the Imperial and Coachella valleys are any indication or forecast of grape conditions later in the season, California has hopes. Sound arrivals of Malagas and Thompson Seedless have met with a ready demand. Malagas have arrived in better condition than the other varieties, as the Thompsons have been affected by vine hopper, which has seriously affected the quality of the grape.

Reports come to us from the northwest indicating that the apple crop will not exceed 60 per cent. Bartlett pears from Oregon, Washington, Montana and Idaho are now moving, and as the tonnage is below normal, the greater proportion of the shipments will be confined to the northwestern markets, fancy stock only reaching the Atlantic seaboard.

Late pears from California should meet a ready demand, provided the stock is good. Shipments of Bartletts from the Sacramento river and the Suisun district are now considerably lighter and the season should terminate within the next ten days. Prices as a whole for California Bartletts to date have been very satisfactory but some offerings have ruled low, due to several cars showing scab and the effects of thrip. Burbank plums have sold at only fair prices, the demand seeming to run to blue plums.

The following prices have ruled for the week:

New York—Bartlett pears averaged $2.20; Burbank plums, 93c; Tragedy, $1.28; Wickson, $1.28; Climax, 71c; German, $1.37; Eureka, $1.00; Malaga grapes, $2.10; Thompson Seedless, $1.85; St. John peaches, 63c; Elberta, 90c.

Chicago — Thompson Seedless, $1.59; Malaga Grapes, $1.68; Bartlett pears, $1.87; St. John peaches, 50c; Wickson plums, 85c; Burbank, 70c; Hiniori, $1.25; Duane, 62c; Tragedy, $1.27; German, $1.33.

Boston—Bartlett pears, $2.42; Eureka plums, $1.55; Burbank, 85c; Tragedy, $1.42; Wickson, $1.45; Sultan, 80c; Hiniori, $1.30; Hale peaches, 60c; St. John, 70c.

Total shipments to date, 3531 cars; total shipments same date, 1914, 4549 cars.

California Almond Growers' Exchange

The Exchange has withstood every storm, met every obligation, and has held fast to those teachings which stand on truthfulness, honesty, equity and square dealing in business. In five years it has grown from a membership of 230 growers to 900—a record which stands as a silent testimonial to the efficiency of the Association.

MAIN OFFICE, 311 CALIFORNIA STREET,

San Francisco, California.

PAPER RAISIN-DRYING TRAYS.

[Written for Pacific Rural Press.]

A country traveler in the Dinuba country in winter wonders at all the papers lying or blowing disreputably throughout the vineyards. Inquiry discloses that they have been used as drying trays for raisins; and, according to C. B. Driver, they are much more convenient than ordinary trays and much cheaper.

Wooden trays must be hauled to the vineyard and back again to be stacked. The papers are simply hauled out in bundles, and after use, are burned when the brush from winter pruning is burned.

In drying raisins, when the rain threatens they just roll up the grapes inside the paper trays twice as fast as they could stack wooden trays. They leave them rolled through the rain, then unroll them for further drying. If the weather is too hot when the raisins are nearly dry, and they are continually exposed to the sun, they taste like burned sugar — Thompsons sooner than Muscats because they are smaller. To prevent this, the ordinary trays would be stacked, but the paper trays are simply rolled up.

They are made from heavy Manila paper, 60 pounds per bundle of 960 trays, all cut 2x3 feet. Fifty-pound bundles are too light, and the paper is likely to tear.

Dr. Chas. Keane, State Veterinarian of California, has taken the position that the Show Herd of dairy animals which was quarantined at Hawthorne Park, near Chicago, Illinois, will not be permitted to enter California for any purpose during 1915. While Dr. Keane feels that the quarantine would not have been raised on these cattle by the Department of Agriculture if there were any danger of them transmitting foot-and-mouth disease to other animals, the general impression prevails in most parts of the country, and especially among exhibitors who desire to show animals at the Panama-Pacific International Exposition, that the International Dairy Show Cattle should not be permitted to be shown at San Francisco.

A letter has been received from Albert O. Pike, one of our valued subscribers from Hectorville, South Australia, in which he says: "I am pleased to say that our long extended drought seems broken at last, for during June we have had copious downpours of rain. The growing crops are soothing to the eye."

The Oakdale Union High School will have a course in agriculture next term.

Publisher's Dep't.

We have received from the bindery a lot of cloth-covered binders for filing current numbers of the Pacific Rural Press. This binder will hold copies for a complete year and is easily operated. By punching two holes in each copy of the Press when it arrives and then threading on a string and tying it, the papers are kept securely and cleanly. The price of these binders is $1.00 each.

Trade-marks and advertising are the two greatest public servants in business today. Their whole tendency is to raise qualities and standardize them, while reducing prices and stabilizing them. It is safer and cheaper to buy the well known advertised article put up by the manufacturer with his name and trade-mark on the package. Safer, because the manufacturer who puts his name on his goods puts his future into your hands. He must put quality into the goods or lose your trade, because you can always identify his goods. Cheaper, because advertising reduces the producing and selling costs of manufactuers by enormously increasing their output.

Every breeder of stock in California should read the signs of the times carefully these days. As we see it, there is now on foot a great movement for more and better stock for California. To make the greatest success, more pure bred stock for foundations is imperatively needed and those who can should prepare to furnish it. The man who satisfies himself by investigating that a certain kind and breed is what he can produce best and then gets busy will make fame and money.

$585 Buys This Combination Farm Tractor and Portable Engine

(F.O.B. Minneapolis, Minn.)

A Bull Tractor running a centrifugal pump in the Sacramento Valley

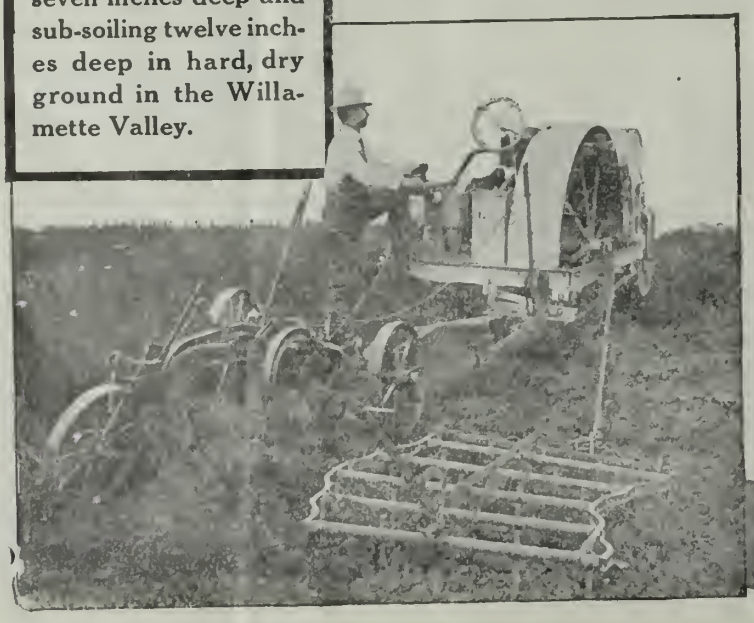
A Lady Bull Tractor operator in Los Angeles County

The BIG BULL is an all-purpose tractor, built to do all traction work on the farm. The Big Bull's price not only puts this proven money-maker and money-saver within YOUR reach, but actually makes horses TOO EXPENSIVE TO BUY OR KEEP. Think what the BIG BULL will do on your farm. It does the work of several horses and men. Does it faster, better, much cheaper. BIG BULL does all your plowing, discing, seeding. Runs manure spreaders, draws heavily loaded wagons, pulls hay loaders, mowers, binders. Runs corn shellers, feed grinders, small shredders, threshers, and ensilage cutters. BIG BULL is not only a powerful, economical tractor, but a PORTABLE ENGINE as well. Fifty-five hundred now used. BIG BULL is making money for farmers in every section of the United States. Never before was a farm machine so universally welcomed. YOU have undoubtedly always wanted a hard-working, labor-saving traction engine on your farm. Now's your chance to get one—at a price that breaks all records.

BIG BULL is entirely out of the experimental class. It has thoroughly demonstrated what it can do, working in all kinds of soil for the past two years. It can be conveniently and effectively used for SUMMER FALLOWING.

"BIG BULL"

Produces 20 Horsepower at the Belt, 7 Horsepower at Drawbar



The bull wheel runs IN THE FURROW, yet does not pack the soil. Grousers four inches long on the bull wheel make it a deep-tilling sub-soiler. Hard sub-soil, even hardpan, is easily penetrated, loosened up and made ready for irrigation. Patented leveling device on BIG BULL makes it easily possible to adjust the tractor to side hills or deep furrows. Other features exclusive with BIG BULL are its direct drive with only four gears; steer wheel which runs in the furrow in direct line with bull wheel makes BIG BULL positively and automatically self-steering. Just remove two bolts and BIG BULL'S engine is in plain sight, every part easily and quickly accessible.

BIG BULL is not a "ONE USE" piece of machinery. It is a COMBINATION machine, used on a farm as a traction engine and a portable engine. No team is required to drag BIG BULL into position. It follows your guiding hand from one job to another, and saves you time, work and MONEY ON EVERY ONE OF THEM.

You need this valuable book. Send for it TODAY. Learn what BIG BULL can do for you. Remember that BIG BULL'S price, $585, makes it an actual WASTE of money for you to continue working horses. BIG BULL works one-third faster than your best team and costs you NOTHING when not in use. BIG BULL is the best investment you can make. It immediately puts you in the class with the big successful farmers and ranchers who wouldn't think of operating their farms without a traction engine. They know it's the ONLY real economical way. So will YOU know it after you have worked BIG BULL on your place for two hours. Get our free tractor book NOW.

We have a few "Little Bull" Tractors left at $495. Five Horsepower at the Drawbar, 12 Horsepower at Pulley Belt. There won't be any more after our present stock is exhausted.

Note the photo below, showing a Big Bull pulling a J.I. Case 2-14 inch bottom "Enicar" Power Lift Plow, Harrow and Sub-soiler, plowing seven inches deep and sub-soiling twelve inches deep in hard, dry ground in the Willamette Valley.

Relation of Butter Markets to Dairying.

The Creamery Man Who Does Not Pay More for Good than for Poor Cream is Retarding the Development of the Dairy Industry. Higher Butter Prices Will Come When Dairyman and Creamery Man Co-operate in Turning Out a Butter that Will Sell on Distant Markets.

No great industry of a State can with safety grow faster than its markets, and for that reason far-seeing men interested in the dairy industry of California are at present more interested in markets than they have ever been before.

And well they might be, for we have last year produced something more than five million pounds of butter in excess of what we consumed at home. Those who have kept themselves at all posted know that the bulk of this excess butter has been successfully shipped to Australia this year. They also know that this is at best a temporary relief due entirely to the drought conditions in that country, which created an underproduction.

At the present writing, our storage supply is less than one-half of the normal amount and the prospects are for better prices during the winter months. But what of next year and succeeding years? Our dairy industry is gaining in production each year a great deal faster than our home consumption. This brings us face to face with the same problem that has and still is facing many other agricultural industries in this State, viz.: Whether we shall stop with our present production or continue to advance and develop outside markets.

With dairy products, there is no choice. We have the feed and the farmers to grow it and are fast growing into better dairy cows to eat it. It is an economic necessity that we enlarge our dairy industry, which as above stated means that we must enlarge our markets. We are speaking now of butter, for that is and will no doubt continue to be our chief product, although cheese, which will be mentioned later, must not be forgotten.

Marketing California's Surplus Butter Is Purely a Matter of Quality and Will Always Be. When Producers and Manufacturers Appreciate This Fact More Thoroughly There Will Be No More Talk of Over-Production or Low Butter Fat Prices.

Where Our Markets Are.—According to the best informed distributors, undeveloped markets await our butter from Alaska to South America on the Pacific side and from New Orleans to New York on the Atlantic side. It is pointed out that San Francisco is the logical market for the Pacific Coast butter trade as for other exportable products; and with the exception of competition from Australia and New Zealand, which will probably be a negligible factor for the reason that their channels of trade are with England rather than America, we will some day have a large and growing market to supply on this Coast. From a butter trade standpoint, however, the Atlantic Coast trade is most enticing since the completion of the Panama Canal.

While as yet no refrigerator service from San Francisco to New York has been installed, rates on butter have been quoted as low as 90 cents a hundred as compared to the present rail rate of around $1.70 from Wisconsin, Iowa, and other middle western states to New York on butter.

On account of density of population, with a resultant drain on their whole milk resources for city trade, the New York market will demand butter importations in ever-increasing amounts; and from the above quoted rates it appears that California has an edge on middle western competitors in freight rates at least. It is also a noteworthy fact that our heaviest production and lowest prices have for years been during March, April and May, while similar records of the New York market show that receipts there are lowest during those months and prices higher than at any other season.

Considering the matter from a cost of production standpoint, there is no question but that our feed and climatical advantages make it possible to produce butter here cheaper than it is now possible in any middle western state.

After all, then, it does not seem important that we get unduly excited about our dairy industry either from a production or marketing standpoint; but in truth we should get excited, and that excitement should lead to the united action of producer, manufacturer and distributor alike.

Whether it be Pacific or Atlantic Coast trade that we strive for, the all-important consideration, and the one upon which all exporting of butter hinges, is quality. Second quality butter will not command first quality prices in distant markets any more than it does here, or any more than a pair of overalls will command the same price as a pair of broadcloth trousers.

Who Is to Blame?—Neither factory owner or dairyman is wholly

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau, at San Francisco, for the week ending at p. m., August 2, 1915.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal to Date	Temperature Data: Max'm	Min'm
Eureka	0	.20	.11	64	52
Red Bluff	0	0	0	102	66
Sacramento	0	0	0	96	56
San Francisco	0	.01	.01	70	50
San Jose	0	0	0	86	50
Fresno	0	0	0	104	58
Independence	0	0	0	94	..
San Luis Obispo	0	.01	.01	86	48
Los Angeles	0	0	0	82	62
San Diego	0	0	0	74	62

THE WEEK

The passing days find us in the thick of the Exposition Congresses. Every other man you meet on the street has his features "sicklied o'er with the pale gleam of thought," and every other woman shows by the set of her hat that she lives in higher reflections than those of the mirror. Except when they drop to the common level of mankind and hustle for buns in the cafeterias, these guests of ours are true Athenians, for they spend "their time in nothing else, but either to tell or to hear some new thing." And they are having a grand time of it, except when the San Francisco fog gets too thickly entangled in their gauze underwear and they begin to realize one thing particularly new to them, viz.: that the name California is not wholly built up from words signifying heat. All during August and beyond, these national scientific bodies will be assembling within hearing of the booming of the Exposition fireworks, bringing to California new visions of the all-permeating power of science, for surely very few of us knew how many national associations of science there are in this country, nor how deeply their work enters human life and action at all points. But here they are, touching elbows with us in all our throngs, men and women whom the world calls great, because they reveal wisdom and understanding—congressmen and women intellectually higher than our conventional type thereof as displayed at the national capital; men and women whose thoughts now as never before influence our rulers and underlie our national policies: men and women who tell our national observatories how to find new worlds in the back-lots of the universe, and how to produce babies who can really justify proverbial wisdom because, through systematic observation and registry, they can know their own fathers. It will really be wonderful how much better the world at large will know California after this invasion by thousands of people upon whose words the world hangs expectant. And they are delighted with what they see here in nature and in human achievement: in all their coming years they will never cease to speak and to write of California. No Exposition success will be so fundamentally and enduringly influential as that of its great congresses of the world's thinkers and creators in the realms of history, art, literature, science, economics and the humanities, for in all these and allied lines great thinking and great speaking are being daily achieved beneath the cool summer skies of the metropolis.

Horticultural Events.

Among the Exposition assemblies, from an industrial point of view, probably none will be greater than those of the horticultural and pomological groups. Several such events have already passed, but the great chain will really show its first link with the assemblies of the Coast and State Nurserymen's Associations, beginning on August 12th and closing with "Nurserymen's Day" at the Exposition August 16th. Details of these meetings, as they come to us, will appear on other pages. It is fitting that the series of meetings of horticulturists, pomologists, florists, gardeners, park superintendents, etc., should open with the work of the nurserymen, for it surely underlies all our planting activities, both for pleasure and profit. Not only this is and always is to be true, but it is well to remember that our annual million-dollar product of fruits and fruit-products historically outgrew from gardens, of which the owners were, in most cases, our pioneer nurserymen. Of course, the padres had to teach the Indians the origin of the human race and its relation to the Creator by making gardens, of which they could get no idea except by such demonstration. The early settlers who wearied of trapping and scrapping with Mexicans also made gardens and dozed from hardship in the grateful shade of their vines and fruit trees. From the gardens at the Missions and the gardens of the restful trappers, many of the gold-seeking throng of '49 took first suggestions of California garden joys and first seeds and cuttings for their own planting. While early mining was still at its height, early nursery work began, and was but the extension of garden planting. Thus the garden was historically the parent of our great nursery industry, which now counts its profitable use of land by thousands of acres instead of by thousands of square feet, as at its beginning. Such facts as these, in addition to its fundamental nature, as furnishing that which is indispensable in planting, should give the nurseryman just pride of calling in their vocation and lead all who are connected with California plant industry in any form, as well as those who on broader grounds take patriotic interest in the development of the State, to contribute to the success of the meetings, of which announcement is made for next week. The nursery industry of California is well organized in its association, of which the officers are exceptionally active, intelligent and devoted, and every one in the business of plant propagation in any form should add his own strength to that of his representative association—which can surely be called a "grand, old business," for was not Adam the first man to be expelled for misbehavior from a nursery society? Do better than Adam: get in and stay in.

Our Fruit Growers' Conventions.

The sad scarcity of fruit growers at the convention at Stanford University, of which an outline-report is given on another page, is only what might have been expected, for two reasons. First: the meeting was called at a time when nearly everybody who has fruit was busy with something connected with its production and harvesting, and also at the low point in his annual financial barometer. Second: the meeting did not offer the stuff which growers will make sacrifice or pay money to get, because it is amply otherwise provided. It is a mistake to lay out a popular convention for promotion of State interests on the line of a local farmers' institute, or of a short course at a University. This is a mistake because the subjects and speakers are too academic to draw men who need to confer on points of advanced practice; also because such subjects and speakers are amply provided by the University occasions, which are offered at times of greater leisure. The strictly educational phases should be left with the University, and it is the University's function to rake the world for those fit to set forth comparative studies which may have some suggestive relation to California conditions. Such speakers do not usually have the California point of view, and their achievements in thinking and research have been gained under radically different conditions—only a conference of an educational character can profitably use them by checking up and studying suggestive relations. If academic work, of clear local value and application, is desired at popular assemblies in California, our own trained experts, wise through actual contact with local conditions, are the ones to furnish it. A stranger may mislead or unsettle without consciousness of doing it, and with the most sincere desire not to do so. Our fruit growers' conventions need fuller divorcement from academic elements: we should be inclined to try one without a college man or a horticultural official on the platform. Even the ex-officio chairmanship of the convention is a burden. It was invented many years ago to crush kickers and protect the bureaucracy: it is better to let the assembly handle kickers and to conduct the bureau so that it protects itself by general esteem. If our fruit-growers were called together to confer as they desired on topics of current importance, without being closely programmed or personally conducted, the lost influence of their assemblies would be regained.

The Fruit Foods.

We are glad to see indications that California fruit foods are emerging from some of the clouds which lowered earlier in the season. The city canners have shaken off part of their funk and are clearing up surpluses in the retail markets. If the country canners had not picked up such a scare early in the season, it would have been better for all concerned, for the outward movement has started briskly under the reduced freight rates to the East. Table grape growers have been encouraged by better contract rates for August delivery, and courage seems to have been gained that Eastern people will need all the good ripe grapes we can send them. The condition which is now appearing would have been foreseen earlier in the season if the pessimists had not wailed so loudly—either from fright or self-interest. The New York National City Bank has issued quite a

detailed discussion of the situation, of which this is the gist: "The industrial revival has now reached the stage where, with the additional impetus that may be expected from a good crop, it should include nearly all lines and assure a satisfactory state of general trade this fall." This means, of course, a better demand for California fall and winter fruits and for preserved fruits of all kinds.

Exports of fruit products to Europe are increasing. James Madison, manager of the Raisin Association, announces the sale in Fresno of 3000 tons of raisins for export to European countries. England is to receive the larger portion of the shipment, as the supply in Turkey has been cut off by the war. More large orders are predicted. Australia is taking greatly increased shipments of dried fruits from this port. Italy is taking California prunes—not many of them yet, but four times as many in 1913 as in 1912, which is a rapid rate of increase. It is reported that the demand for prunes has developed through the advice of some of the Italian doctors, who prescribe this form of food for their patients. It would be well for the world if it had more Italian doctors.

Coffee Grounds.

The tea cup has some standing in prophecy, and the amplitude of its residual contents have been long taken as indications of coming wealth, if we mistake not. We doubt, however, if there were ever as good grounds for significance in tea as those we now find in coffee. Experience in marketing coffee seems to have overturned a whole school of economists, and any agency which can do that is surely going some. The school to which we refer has always maintained that the government, first, had no right to do anything in price-fixing; second, that if it tried to do it, it would muss up trade calamitously; third, that such efforts would inflict burdens on producers and give consumers all the chances of advantage. And, therefore, they have exhorted producers not to invoke government help when their produce brought less than its cost of production. The latter was exactly the case when the Brazilian government, several years ago, began to regulate the price at which coffee could be sold, and set this whole school of economists to calamity-howling. Now what has happened? Taking the words of a contemporary which, if we mistake not, has had much to say about the government keeping its hands off private business, this has happened: "Brazil seems in a fair way to afford a complete demonstration of the ability of a government to prevent the producer being made the victim of artificially created depressions of price, and it may be possible for it to prove that the operation of the assumed economic law that a slight surplus must invariably result in greatly advantaging the consumer may be overcome. * * * There has been some doubt expressed concerning the success of Brazil's valorization plan, but the fact that the attempt is to be repeated, perhaps with some change of detail in the mode of carrying it out, implies that it was not a failure. It is reasonably certain that if the scheme had not been attended with satisfactory results it would not be repeated."

In the case of our contemporary making this statement, it is confession which is good for the soul. Of course, there are conditions of supply and demand under which government regulation might effect nothing—or possibly even injury. But when great corporated or syndicated interests scheme to depress prices to producers below what is fair or warranted, it is clear enough that government regulation can prevent it and clear enough also that government regulation should do it.

Vagaries of Rural Credit.

We have always thought that the application of European rural credit provisions might produce some startling surprises in this country, and they are surely on their way. In Europe, if we have read and observed aright, rural credit provisions are promoted by the governments and by the social higher-ups for the increase of food production—not forgetting to credit them with the broad philanthropy which they never forget to claim. If we are not mistaken a European farmer could no more get a rural-credit loan for any other industrial purpose than farming or farm manufacturing purposes, than he could get it to fly with. The administrators of such loans always enquire closely into the farming purpose, the fitness of the land and the man to make good, and then they sit on the fence and see that the man does nothing else with the money. Of course, this is rather a narrow horizon for an American to admire and therefore we are not startled that application of rural credit methods is producing some surprising out-crosses when bred to American farming ideas and operations. For instance, Wisconsin recently passed a law providing that "loans can be made only for increasing the value of the land mortgaged either by supplying live stock or implements for agricultural purposes, retiring indebtedness on improved or partially improved land, or in some manner improving the place upon which the mortgage is taken." The closing clause is rather broad and characteristically American in its point of view, for as we read farther we find that the writer in Hoard's Dairyman, from which we are quoting, points with pride to this operation of the law: "This settler was able to borrow $3,750 on his place, and the sum was considerably less than half what the place was worth. With the funds borrowed under the State land mortgage act this farmer built a small hotel and a store. He met the interest charge promptly at the end of the year and had $450 available to apply on the principal. By getting capital at six per cent interest to work on, this farmer was not only able to continue improvements on his farm, but to develop a small business center which was of direct value to his locality, as well as to himself, and hence a help in the upbuilding of an agricultural section of the State."

We are not at this moment dissenting from this broad view of State-approved credit; it may be all the writer claims for it. But it is none the less amusing to think what a shock it must be to the Wisconsin philanthropists who urged the measure to get more and cheaper food to find their endowed protege in the hotel and grocery business and keeping himself on the farm thereby.

P. R. P. BINDERS

The fifty-two issues of the

Queries and Replies.

Querists must give name and address.

Corn Stalks, Bermuda and Alfalfa.

To the Editor: Would it be a good idea to plow under corn stalks this fall, say, in November, and plant oats for hay; after the hay is cut, plow the land dry several times to kill Bermuda grass and sow in the fall to alfalfa? Would the corn stalks be worked up enough by that time so as not to interfere with a good seed bed for alfalfa.—F. M. B., Hanford.

We suppose you refer to moist land, for on a dry land Bermuda sod you would presumably not get corn stalks enough to matter what you did with them. On dry land, too, if you did have so little Bermuda as not to check the corn, and you had plenty of stalks to plow under, whether you would get oat hay worth mentioning would depend upon whether there was a good heavy rainfall or not. With corn stalks below and dry winter skies above, you would not get much oat hay. On moist land your program might work through all right, but on ordinary plains land we would windrow and burn off the stalks and kill out as much Bermuda as possible by a good dry disking—beginning as soon as you can get clear of the stalks. Then you can put on your oats and get winter growth while it is too cold for Bermuda and go on with your dry working the second summer. But we should cut out the oats and put in the alfalfa this fall or next spring as early as safe. Unless the land has alkali enough to give the Bermuda the right of way, alfalfa will fight it and make good feed of the mixed growth.

Peach Blight on Fruit.

To the Editor: I am sending some peaches with spots on them. Please tell the cause and remedy. The cannery refuses to take them.—A. R. D., Pomona.

The blemishes are large groups of circular blackish spots about an eighth of an inch or more in diameter. Sections show that the trouble is in and slightly under the skin. There is nothing to do with such peaches but hand-peeling and drying—when this can be profitably done. The cause is the peach-blight fungus which usually does worse work in the bark of the twigs, but this has been a fungus year and the spores have been busy on the fruit. The treatment is spraying with Bordeaux in the fall, after the leaves have fallen, and repeated in the spring, before the blossoms open.

Distracted by Extracting.

To the Editor: I have been in the bee business twelve years. The last two years I have suffered from a poison in my face and hands every time I extract the honey. I have tried a number of remedies but none helps. It lasts two or three days. Do you know the cause or if there is any remedy? I am unable to sleep nights during the trouble.—O. W., Dinuba.

We have had no observation of such a trouble, but some of our beekeeping readers may be able to explain it for us. If they do not respond we shall either take the case to be one to be studied by your physician or to be avoided by getting some immune person to do the extracting for you.

Vital Discussions at Fruit Convention.

[Written for Pacific Rural Press.]

A cracking good program delivered to unusually small audiences, amid the most beautiful surroundings, at Stanford University, characterized the 46th California State Fruit Growers' Convention. But already the boosters are busy for the next one, which will be held the third week of November at Visalia; and the program has been partially arranged for some of the best speakers at this convention to figure on giving still better papers there.

The criticism that there were too few papers by actual fruit growers will be met by the arrangement that at least half of the next convention program will be given by men who have been most successful in their line of fruit growing; the other half will be by scientists of State-wide and Nation-wide repute. The criticism was also made that papers prepared by scientists and growers of other States are likely to mislead our growers on account of different conditions.

For the federation of California agricultural organizations, a tentative constitution was drafted to be reported at a great gathering in San Francisco of all interested farmers of the State in October or November. The constitution provides that all associations affecting agriculture, whether State-wide or only county-wide, should be allowed to send one delegate as an active voting member of the federation. Besides these active members, all people interested might join by paying a membership fee of $1.00. One of the big questions asked in the convention was: "How can we co-operate?" A pretty big question this—but it was pointed out that one of the duties of such an agricultural federation would be to help put into operation proved principles of co-operation.

The original committee appointed to work up the federation was continued for the purpose of reporting at the next convention on a form of organization for the fruit growers of the State in order that they might send an accredited representative to the federation. Such an organization would also be an effective means of making the conventions more generally valuable and appreciated by the fruit growers of the State, whereas now the work all depends on the call of the State horticultural commissioner.

The first session of the convention has already been reported. Wednesday morning was largely devoted to pears; and it was during this session that the greatest number of questions were fired at the speakers in the discussion which invariably followed the reading of papers at this convention.

R. H. Parsons, a pear grower of Washington, made the following points: Asiatic pears are most resistant to blight, but are of slow growth. The most dangerous location of pear blight is on the trunk and roots, where it is also hardest to eradicate. Grafting the Keiffer, which is a cross between the Asiatic and European pear, onto the blight-resistant Asiatic root, letting it grow two or three years, and then grafting the desired variety of pears onto its limbs, supplies a faster growing blight-resistant trunk and roots.

Japanese pear stock was advocated by A. L. Wisker of Grass Valley, as being very blight resistant, does not sucker much, and seedlings have had less of the fungus blight in nurseries. Pear root aphis does not hurt it. It is needed in the dry soils, especially in the Sierra foothills, where there is great injury due to the root aphis. For wet soils, dwarf pear trees on quince roots were advised, especially because dwarf trees are so much easier treated for blight. Many varieties must be double worked if quince stock is used.

Production of pears will treble in ten years, according to Percy Gammon, another pear grower. The future is bright for growers who keep everlastingly at the blight fight. On the Gammon ranch, patrols are started at blossoming time to cut out all infected twigs and burn the brush every night. The root and trunk work is done mostly in the winter time. During the last fiscal year, with the trees in fair condition at the start, it cost 30 cents per tree for the blight fight and was far more than worth while. Tanglefoot is applied around the trunk about two inches wide to prevent passage of ants from infected tops to uninfected roots. Infection comes from neighbors, who, under the law, are obliged to clean up the blight; horticultural commissioners are supposed to eradicate blight where people will not, but do not always carry out the law, causing reinfection in spite of persistent fighting.

Apricots.—Older trees need irrigation to mature regular crops, according to F. B. McKevitt. Shothole fungus is a great menace. Owing to particular soil requirements it is not possible that the apricot will be overdone like the peach. Consumption should be increased by marketing dried apricots in small packages and advertising in journals that reach the homes. Growers must organize to do this advertising and increase consumption. Summer pruning is best just after the crop is off, with an irrigation just before or just after the pruning, to strengthen the buds so that they will resist the shothole disease and set fruit persistently.

Sulphur as Fertilizer.—Fertilizer experiments carried out in southern Oregon, according to F. C. Reimer, Sup't. of the Southern Oregon Experiment Station, showed very little result on alfafla from applications of nitrogen and potash, but showed remarkable rusults from applications of superphosphates. Since superphosphate is high-priced, in the second year ground rock phosphate with double the phosphoric acid at half the price was used, but the expected crop increase did not materialize. It was decided that the sulphur in the superphosphate was the needed factor. Crude sulphur was then applied at a cost of about two cents a pound on similar plats and monocalcium phosphate on others at a cost of 9 cents per pound, plus express charges from Rhode Island. The sulphur gave the increase, but the expensive and most available form of phosphate did not. The Wisconsin Experiment Station has recently shown that sulphur is much more used by plants than was formerly known on account of incorrect analytical methods. Gypsum has a good effect on account of its sulphur content, besides whatever effect it will have on the soil. The greatly increased crops due to applications of sulphates remove greatly increased quantities of other available plant food elements, thus reducing the soil fertility much more rapidly than if smaller crops were raised. That is why some alfalfa fields increase rapidly for a few years under the use of gypsum, and then fail. Legumes, cabbages, etc., need sulphur more than fruits and other crops.

Cherries.—With cherries, resistance to gummosis is best obtained by growing Mazzard seedlings, which cost about one cent each, and top-working other varieties into the limbs.

Avocados.—Are here to stay, the only question is as to what variety, according to Prof. D. L. Crawford of Pomona College. At present, nursery trees and fruits cost too much and we have too many "amateur propagators" who do not pay attention to bud selection. The avocado growers, according to C. P. Taft, are already organized along the lines of citrus growers, taking time by the forelock to avoid the disasters which came to citrus growers before they were organized, on account of large production and poor distribution.

New Citrus Methods Developing.—Great changes are now taking place in the culture and handling of citrus trees, according to Dean H. J. Webber of the Citrus Experiment Station at Riverside. Clean culture has been actually killing the soil by opening it to the great disinfectants—light and air—which kill the bacteria which work the cellulose of organic matter into humus, without which citrus trees cannot thrive. Cover crops, not only for their organic matter but for their shade, have been shown necessary by the fertilizer plats at the Station where organic matter was applied steadily, and clean cultivation practiced. There the soil has been deadened by clean cultivation, though it is rich in nitrogen. It has been found that furrow irrigation carries nitrate plant foods downward with the water and then upward, concentrating them close to the surface where the roots are less liable to use them and where the land is always dried in the form of a cultivated dust mulch. There is a tendency to believe that we must go back to basin irrigation, filling the basins with alfalfa or other organic mulch that will prevent evaporation and conserve the soil moisture, shade the soil to prevent killing of the bacteria, and finally by its own decomposition enrich the soil. The fire danger of such mulch if continuously applied throughout the orchards can be prevented by leaving levees between the basins unmulched. If anything tends to drive the plant pathologist crazy, it is the number of spotted fruits sent in for diagnosis. The differences are obscure, and their causes are little

California Garden-Flowers
SHRUBS, TREES AND VINES

Being Mainly Suggestions for Working Amateurs.

By Edward J. Wickson,
Hon. President, California State Floral Society.

FIRST EDITION—1915.
262 pages, 5½x7½ inches; illustrated; cloth bound; 12 full-page photo-plates and numerous text illustrations.

This book aims to tell the beginner in California, whether he be a scholar struggling with his school-garden, or a suburban gazing vacantly on his residence lot, or the farm-home maker, who is puzzled to translate his experience with teams, plows and pasture fields into trowels, pruning-shears and lawns, just what to do to make garden-soils, grow plants and surround his abode with beauty under the peculiar climatic conditions of California.

known. Prof. H. S. Fawcett has, however, found that squeezing a little lemon oil onto the skins deadens the tissue about it. Packing fruit high in boxes to get the most weight, to get the premiums at some shows, must surely break oil glands and cause spotting soon.

Almond Outlook. — Almond requirements are known, the pests are under control, and the future of this industry depends on securing markets for the 5 times multiplied crops that are due in five years, according to G. W. Pierce of Davis. Spain is California's chief competitor. Labor for the almonds there is obtained at 25 cents a day for women and 60 cents for men, and it costs 27 cents per cwt. freight from Spain to our eastern markets, while it costs 75 from California via Panama and $1.40 by rail. In the face of these facts, the tariff was reduced from 6 to 4 cents on shelled almonds and from 4 to 3 on unshelled. Two-thirds of the imported almonds are shelled, and by hand. The Cal. Almond Growers' Exchange shells by machinery, having a carload of meats per day capacity.

Co-operation.—This factory was built out of the profits of co-operation after paying the highest prices to the grower members. No assessment or contribution was leived for the building fund. The 20 per cent of California almond growers who have not joined the Exchange furnish the ammunition which is used for the purpose of undoing co-operation. Independent growers are paying a commission for their own undoing.

Co-operation of orange growers, when no one of them could determine the cause of loss of 10 to 40 per cent by decay on the way to market, was the means of bringing G. Harold Powell to the coast and the discovery of means of preventing most of the loss, according to J. H. Reed of Riverside. Co-operation was the means of obtaining the Citrus Expt. Station, which, in his opinion, is about to revolutionize the industry.

Legume Cover Crops.—Two hundred pounds of nitrogen per acre for $8 cost of seed, plowing, and cultivation, besides the physical improvement of the soil, addition of humus, and reduction of mottle leaf, are the results of leguminous cover crops according to C. S. Vaile of Claremont. Only ¼ of the orchards investigated by the Citrus Experiment Station had cover crops of any kind and half of these were non-legumes. All varieties are best sown in September for legume cover crops.

Orange Standard of Maturity.—Data on the composition and color of mature oranges from one district are not necessarily correct for other districts nor for other seasons in the same district, according to E. M. Chace of the U. S. Dept. Agr., and accordingly, tests are being continued in the various districts and under various conditions of each district. Tulare county found most commendable results from the 8 to 1 test last season, though Butte county lost by it.

Insect Parasites.—Much harm has been done by depending on natural enemies of our insect pests rather than using proved methods of control, according to Prof. A. W. Morrill of the Arizona Expt. Sta. Harry Smith of the Cal. State Insectary and Dr. L. O. Howard, head entomologist of the U. S. Dept. Agr. corroborated the statement, saying that natural control of injurious pests is in general not yet to be depended on.

Soil Conditions and Crop Production.—A cubic foot of fine soil, if the surface of its particles could be spread out, would cover an acre, according to Dr. J. G. Lipman of the N. J. Expt. Sta. Water to be available for plants, is spread in a film on the surfaces of the soil particles. If it fills the spaces between, it is harmful. In peat soil, the particles hold the water so tenaciously that much of it is not available, while in coarse soil, the total surface of the particles is much reduced. In general if a soil has about half of the water it is capable of holding the balance between soil water and soil air is most favorable for crop production.

U. S. is now using $150,000,000 worth of commercial plant food yearly. If we fertilized like Germany, we would use $1,600,000,000 worth. California uses 50,000 tons of commercial fertilizer annually, while New Jersey uses about 200,000 tons. We sell $10 worth of nitrogen when we sell a ton of alfalfa hay for $8. If it all came from the soil it wouldn't pay.

In order to get the good offices of soil bacteria in rendering plant food available, we must supply them with nitrogen or with legumes which enable them to help fix atmospheric nitrogen for their own uses. In using nitrate of soda, about 62 per cent of the nitrogen was recovered in certain crops analyzed, while only 40 per cent of the nitrogen in cow manure was recovered. The rest was used by bacteria, leached away or fixed by chemical combination in unavailable form.

Eel Worms.—Eel worms, according to Prof. Peter Frandsen of the University of Nevada, are widespread and infect many plants and trees, being most serious in potatoes. They stand moderate freezing for weeks at a time. Fourteen days' freezing at 15 degrees F. killed all worms and eggs. But drying is very quick and effective in their control. Formalin treatment of infected tree roots is doubtful. Baking seed potatoes at 102 degrees for 24 hours sterilizes them without killing the seed. Plowing and cultivating a field free of vegetation or irrigation for a year is rather effective in control.

Olive Outlook.—"If New York City ate as many ripe olives per capita as Oroville, California couldn't supply them," said B. B. Meek of Oroville, after Frank L. Brown of the Exposition had called attention to California's 25,000 bearing acres as compared to Europe's 10,000,000. A state-wide olive growers' association modeled after other proved co-operative organizations was urged, but no action taken. Prof. W. F. Oglesby pointed out that olive knot is the only serious disease, and black scale the only serious pest in California, while troubles are multiplied in the old country.

Livestock Necessary. — Raising plants to feed animals to make fertilizer to feed other plants was emphasized and reiterated as the only solution of farming problems, by Prof. Roberts. "And raise boys and girls, too, out in the country." Prof. W. P. Kelley of Riverside Expt. Station also emphasized the need of diversification.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower,

Land Owners Guarantee Nursery Bills.

[Written for Pacific Rural Press by Chas. A. Chambers, Fresno.]

A custom which has prevailed ever since nursery stock was sold commercially, has been a detriment to the grower and seller of nursery stock; and nurserymen generally have suffered to the extent of many thousands of dollars as a consequence.

The custom I refer to is none other than selling to a man who has bought a place on part payment, a bill of nursery stock on credit, or where a small payment has been made on account, the balance to be paid at some future designated time by note, or open account.

We will assume that a Mr. John Pipp purchases a bill of nursery stock from the Watt Nursery Company. The nursery stock so bought is planted on twenty acres of land that Mr. Pipp purchased from a Mr. Ketchem. Mr. Pipp in the first place possessed only a limited capital. The price of the twenty acres represented the total sum of two thousand dollars.

Mr. Pipp practically starts in on a ten per cent capital and ninety per cent credit. In other words, Pipp tries to swing this twenty-acre proposition with a capital of $500.00. He pays Ketchem, the land owner, $300, initial payment, and promises to pay the remainder due in three years at 7 per cent interest.

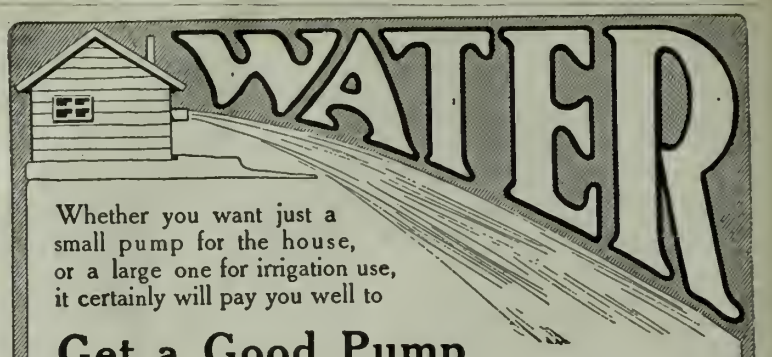
After this part of his start is consummated, Pipp hunts up Watt, the nurseryman, induces the latter to let him have a bill of nursery stock amounting to $300, paying $50 on account of his purchase and gives his note for the balance, payable in a year. Pipp, after he gets his place planted, figures on getting some sort of employment to tide him along until his place is developed, but misfortune befalls him and in about twelve months after starting his twenty-acre ranch venture, Mr. Pipp arrives at the conclusion that he is unable to swing the undertaking and decides to throw the land up, and the ownership reverts back to Mr. Ketchem. The latter has practically an improved place at this stage of events, at the expense of both the nurseryman and the limited amount of capital invested by Mr. Pipp to get the place planted.

The nurseryman figures as the biggest boob in the transaction, as Ketchem is not responsible for the debts of Pipp and as Pipp bought the nursery stock, Pipp must pay the bill. Pipp is penniless and cannot pay and it is up to the nurseryman to worry along and do his best to make Pipp pay the bill. Pipp, by losing his place, does not feel enthused in paying for something he never got the actual benefit of, and the account drifts along, becomes outlawed, and the nurseryman suffers the consequence. There are thousands of this identical case being pulled off in the United States from year to year. What's the remedy?

Someone else will have to answer this question fully. It is all very well to say the nurseryman must be careful in selling stock to this class of buyers, but how is one to know the exact circumstances in deals of this character? In these cases conditions appear on their face as regular. The nurseryman presumes, if a purchaser invests his time and money to begin a proposition of this sort, he acts in good faith and will take a chance. It occurs to me, however, that this chance taking should be regulated in some way to prevent so many heavy losses to the nurserymen.

Let Those Who Benefit Pay the Bill.—I think the original seller of the land, inasmuch as he gets the benefit of the land being improved and planted, should at least guarantee the payment of the bill of nursery stock purchased to effect the improvement. The original owner can afford to assume at least the amount expended for nursery stock, especially when he receives the benefit of a substantial cash payment on account of the purchase price of the land and the benefit of the labor and energy expended by the buyer, who later throws up and quits his task.

Or if some law was passed to provide that in all sales of land, where the purchaser does not pay the entire amount in cash, that it will be the duty of the seller to ascertain from the buyer exactly what the latter intends to do towards initial improvement and thereby make provision for his own protection, in the event that the law holds the original seller liable for not only nursery stock planted, but lumber for house building and other embelishments within reason, which is actually used in improvements. No personal purchases, or obligations to figure in the consideration— simply actual commodities used in constructive improvements on the land proper.



COVER CROPS AND FAILING WALNUTS.

To the Editor: I see by your index that you have already answered questions on cover crops, but as I am a new subscriber to your paper I have not had a chance to read them. I would like to know what would be the best cover crop to plant as a soil renovator for a light sandy soil. When is the best time to plant it and when could it be plowed under?

I have two English walnut trees planted in the spring of 1914 which have made practically no growth and now the leaves are curling and turning black. What is the cause, and is there anything I can do for them.—Subscriber, Bakersfield.

[The best plant for cover crop in any place is the one which makes most growth for plowing under green. This has really to be determined by trial. The plants discussed by Mr. Bristol in July 31 issue may be good for you. Burr clover is one of the best when the growth has to be made by winter rainfall and plowing is done in the spring. If you have irrigation and can grow a summer crop, cow peas are good. It looks as though your walnut trees may have had too little moisture or find alkali in the soil. Plenty of water and good cultivation may save them.—Editors.]

"Some men have no hearts," said the tramp. "I've been a-tellin' that feller I am so dead broke that I have to sleep out doors." "Didn't that fetch him?" asked the other. "Naw. He tol' me he was a-doin' the same thing, and had to pay the doctor for tellin' him to do it."

Whether you want just a small pump for the house, or a large one for irrigation use, it certainly will pay you well to

Hay Saves Windfall Pears.

[Written for Pacific Rural Press.]

By using dry hay in the pear orchard, year after year until the hay wears out, B. F. Weston of Santa Clara county, and two of his neighbors, save a large percentage of their windfall pears for the cannery. Without the hay, the pears would fall on the hard, sharp adobe and would be pierced by small pieces of dirt, and would be bruised by the fall, so that they would be hard to sell even perhaps to the dryers.

Mr. Weston's windfalls are not due to worms, for he sprays as thoroughly as anyone, and the codling moth does not bother him. On a still cool night, after a windy day, he has noticed the pears dropping all over the orchard, more it seems than during the wind. These are picked up every morning to avoid sunburning and also to avoid bruising by one pear falling on another.

Fewer Windfalls.—The hay makes a soft cushion, but it also makes the pears a little quicker to sunburn. Avoiding bruises, however, is not the principal advantage. He gets fewer windfalls when the hay is spread all over the ground, perhaps on account of less variation of temperature and moisture in the ground between night and day. This practice was begun a good many years ago on account of a proposition made by a Los Gatos man who wanted to buy Mr. Weston's windfalls for the cannery. He stipulated that straw should be placed under the trees, and because Mr. Weston was skeptical as to the value of the windfalls for the cannery, the Los Gatos man even offered to pay for the straw used. It was applied, but later the contract was repudiated anyway, and the pears had to be sold to the dryers, as usual. Mr. Weston thought that the application of straw did not pay, so next year he used none and got an enormous crop of windfalls. That set him to thinking, and the next year straw and hay were applied in alternate rows on about half of the orchard. The rows which had no such mulch had double the number of windfalls.

Pampas Grass Best. — Now, the whole orchard is mulched every year with cheap hay, straw, sweet pea straw from the Morse seed farms nearby, bean straw, or pampas grass. Grain straw has been found too brittle, breaking under the pickers' feet, and a large part of it cannot be used again. It packs, too, and doesn't form as good a cushion as cheap hay. Bean straw and sweet pea straw are good fertilizers and provide a very good cushion, but are not available in large enough amounts.

The best material for Mr. Weston's purpose in the pear orchard is pampas grass which he can use over and over again for several years. It doesn't pack down or wear out, and it is soft enough so that pears are not injured in falling on it. The mulch material is hauled to the orchard and dumped in piles after the last plowing, which occurs when the limbs begin to droop in the way. It is spread out before picking time as thick as the available material may be spread. When the pears are all off, it is raked into windrows by hand and put into big stacks under an open shed. He used to use a horse to rake the hay into windrows, but this did not pay.

EXPECTS 4-CENT PEACHES.

We present below extracts from a letter written by a member of the marketing force of a dried-fruit growers' organization, confirming items recently published in Pacific Rural Press:

"To the Editor: Peaches, we believe, have been sold heavily in the East at too low prices, and as most peach sales have been made for August-September shipment, if growers fully understood the situation they would not need sell dried peaches to packers at the low prices which are being offered—we understand 2½c or even lower.

"In our opinion growers, if they only knew it, have an elegant chance to make packers and buyers pay them 4c. for good dried peahces this year, which have been sold by packers at too low prices without the consent of the growers who owned the peaches when the sales were made by the packers.

"We also believe that with peach prices as low as they are this year, we may find after drying time that not as may peaches as usual have been dried because of the too low prices, which may make short supply and higher prices for peaches when it is known how few are dried."

NURSERYMEN TO HELP AT SAN FRANCISCO.

Meetings of the Pacific Coast Ass'n of Nurserymen and of the California Ass'n of Nurserymen at the San Francisco Civic Auditorium Aug. 12-14 will precede Nurserymen's Day at the Exposition Aug. 16 and other horticultural meetings up to Aug. 25. Consideration of horticultural laws and the ornamental departments of nursery business will be leading features. Following are the papers to be discussed:

Thurs., Aug 12, 1:30 p. m.—Uniform Horticultural Laws, M. McDonald; Recent Horticultural Legislation, A. J. Cook; Crown Gall, H. S. Jackson; Quality and Wider Distribution, J. B. Pilkington; Reminiscences concerning Nurserymen and Nursery Interests, E. J. Wickson

Fri., 9 a. m.—Ornamental Plants, J. W. Gregg; Propagating Prune Trees, S. A. Miller; Preventing Importation of Insect Enemies, Frederick Maskew; Cost of Growing Ornamental Stock, John Armstrong; Seedlings and Stock Grown in America, M. J. Crow; Walnut Industry, Almon Wheeler; Best Paying Shipping Plums, J. E. Bergtholdt; The New Roses, John Gill.

Friday Evening.—Pacific Protective Assn. meeting.

Sat., 9 a. m. — Department Store and Nursery Industry, Ernest Braunton; Recent Rulings re Shipping Plants by Parcels Post, D. W. Coolidge; The Crime of being a Nurseryman, W. D. Somerville.

Sat., 1:15 p. m.—Why Import What We Can Grow? M. McDonald; Do We Need New Varieties of Commercial Fruits? E. J. Wickson; A. Publisher's Suggestions to Nurserymen, Frank Honeywell.

Of the many conventions to be held at the Exposition, 90 are devoted exclusively to the interests and activities of women.

RADIUM

"Makes Things Grow"

Do you know that in the finely powdered ore-residue from Radium extraction there is left a considerable quantity of real Radium element, not recoverable? And do you know that a small amount of this Radium bearing material, when mixed with any suitable fertilizer, produces extraordinary results in every form of plant life?

What has been accomplished during the past ten years and carried to a practical basis of application on a 130-acre farm in Ohio and other places is told in detail in our booklet "Radium Makes Things Grow." A copy will be mailed free on request. You will find it mighty interesting and instructive.

One Thousand Questions in California Agriculture Answered

Consists of 1000 of the most important questions on every subject that have perplexed the farmer and which have been submitted to the editor. The problem appears with its solution by Prof. Wickson immediately following; a comprehensive index enabling the reader to find the subject which interests him without delay. The 1000 questions and answers cover Fruit Growing, Vegetable Growing, Grain and Forage Crops, Soils, Fertilizing, Irrigation, Live Stock and Dairy, Diseases of Animals, Feeding Farm Animals, Poultry-keeping and Pests and Diseases of Plants, etc., etc.

This is a book of reference that every farmer, no matter in what branch of farming he is engaged, should have on his shelf. First Edition.

Price, $1.50 postpaid.

Mechanical Power on the Farm.

ENGINE BURNS OIL RESIDUE.

For a number of years manufacturers have been working on an engine that would successfully operate on the residue of refined oils, and have been more or less successful. Some eastern manufacturers have been very successful in the East where the oils are of paraffine base, but when their product has been tried in the West, where oils are of asphaltum base, considerable difficulty was experienced. J. A. Ostenberg of San Jose, who has studied and worked at the engine business in California for the past seventeen years, and before coming to California perfected a well-known Eastern make, has worked continuously to develop an engine that would he within the reach of every farmer, and one that could be understood and operated by every farmer.

As an experiment Mr. Ostenberg built eight of these engines called the Victory Oil Motor, and placed them where they would get good hard service for two years, to test their durability. Now after two years' operation these engines are giving perfect satisfaction in Santa Clara county.

It is surprising how few parts this engine has and how nicely it burns this cheap fuel. One farmer who used one of these engines for six months was asked if it sooted his spark plugs. He stated that he didn't know, because he never had looked at one.

TRACTORS SAVE WHEAT FROM FIRE.

[Written for Pacific Rural Press.]

How two Yuba tractors saved $140,000 worth of grain in 60 minutes from a destructive fire, is an interesting story told in connection with the 20,000 acres reclaimed from Tulare Lake, belonging to a company with F. A. Cleveland of Corcoran at its head.

On July 1 one of the finest grain fields of the tract, including 10 sections of wheat promising 20 sacks per acre, became endangered by a fire which started about a quarter of a mile to the north and was rapidly blown toward the standing grain by a north wind blowing at the time.

He immediately pressed into service the two tractors, coupled with two sections of plows. Plowing the stubble border to beat the fire, ¾ of the distance was covered, but the fire was getting fearfully close to the grain along the remaining quarter. Continuing along the border with one tractor and detouring into the standing grain with the other, he drove tractor No. 1 to the very edge of the fire, then turned abruptly across to the path of tractor No. 2 and joined its race to the levee. When the last tractor, cutting and burying 80 inches of grain and throwing the upturned earth at least another 30 inches, pulled to the top of the levees which form a protection all around the sections of grain fields, flames were scorching the driver's face—but the fight was won.

USES OF PORTABLE ELECTRIC MOTOR.

[Written for Pacific Rural Press.]

A portable electric 20 h.p. motor for use on a big ranch is owned by Thornton Glide of Yolo county. Just now the motor is being used in an alfalfa field at a considerable distance from the farm buildings. Shortly, it will be brought back in a cart and set up on a permanent base to cut silage and feed.

The base is made of two 8x8 timbers, 16 or 20 feet long; 4x4 iron hollow supports are bolted to these, having slits in the upper side through which holts project. These holts go through holes in the base of the motor and are quickly adjusted.

When silage or first crop alfalfa chopping are to be done, the machine is bolted to the other end of the 8x8s and run by a belt.

When there is wood or kindling to cut, a circular saw is put in the place of the feed cutter with very little work.

NUMEROUS USES OF LINE SHAFT.

[Written for Pacific Rural Press.]

A line shaft run by a gas engine in a pump house provides opportunity for a variety of operations on the farm of L. S. Wing of Yolo county.

The first pulley wheel on the line shaft runs a pump for water to be used about the place; the second wheel used to run the separator by means of a belt through a partition into the next room, but the whole milk is now sold so the separator is not used; the next wheel might be connected to a threshing machine and the next one to a grindstone, both of which are in place permanently. The last wheel was designed to run a coffee grinder.

Mr. Wing does not use all of this equipment now because it is some distance from the house; but he says it was always satisfactory while there was someone at home who could handle the machinery.

Mr. Hopkins—They say most soap nowadays is made of dead horses.

Mrs. Hopkins (musingly)—Well, I wonder; that must be why the children kick so at being washed.

MOTOR RUNS MILKING MACHINE.

A 7½ h.p. electric motor permanently set beside the cow barn of L. S. Wing of Yolo county runs the vacuum for the milking machines and may be hitched by a belt to the silage and alfalfa chopper by which the barn and the silo are filled with first-class feed for the dairy herd.

A TALE WITH A MORAL.

"We need some corn this morning, father," said Harry Morris of Yolo county, about five miles out of town.

"All right, I will go and get it," said the father, and in a minute was speeding away in the automobile. In less than an hour he was back with a plenty.

HOME-MADE SALOON.

To the married man who cannot get along without his drink, the following is suggested as a solution to the bondage of habit:

First—Start a saloon in your own house. Give your wife $2 to buy a gallon of whiskey, and remember there are 69 average drinks in a gallon.

Second—Be the only customer and you will have no license to pay.

Third—Buy your drinks from no one but your wife, and by the time the first gallon is gone she will have $8 to put in the bank and $2 to start business again.

Fourth—Should you live 10 years and continue to buy booze from her, and then die with snakes in your boots, she will have money to bury you decently, educate your children, buy a house and lot, marry a decent man and quit thinking about you."
—Mrs. J. H. Harrell.

SCORED TREES FROZE WORST.

The only damage in the Mission district of San Fernando valley during the big freeze, according to H. E. Wilkinson, was where the trees had been "scored." The bark on some trees had been slit up to the head for gum disease, hide bound bark, or other reasons. On these trees, the bark froze, or dried, almost free from the tree; and in a few cases the wood itself slit wide open an inch or two. Mr. Wilkinson does not believe in "scoring" except when the tree is hide bound or gummed.

The Farm Bureau of Glenn county has been collecting data in each farm center relating to the extension of needed electric transmission lines for power and the lighting of farm homes. Maps and other information has been prepared by the farmers showing individual needs throughout the county. Operating companies in the county have already expressed their desire to give the wants of the farmers most careful consideration.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Orange groves of the San Joaquin valley are suffering from katydids.

Fresno orange prospects are about 60 per cent, according to Horticultural Commissioner F. P. Roullard.

Orange county Valencias are 90, Navels 40, and lemons 90, as reported by Horticultural Commissioner R. K. Bishop. The fruit is well set and is past the usual drop.

Meetings of citrus growers are being held this week and next at a number of places in Southern California. The principal subject, according to C. S. Vaile of Claremont, is cover crops. Fumigation is another.

OLIVES AND NUTS.

Last year the output of the Davis Almond Growers' Association was 90 tons.

The Walnut Creek walnut growers have a much larger crop than last year. Aphis is worse but blight is better than usual.

The California Ripe Olive Growers' Ass'n, organized March 31, met at Oroville July 31 to discuss protective and boostive measures.

The date of the Esparto Fall Almond Festival has been changed from September 25 to September 4, in order that Capay valley almonds may be shown at the Panama-Pacific Exposition in September after they have been exhibited at the festival.

Melaxuma of walnuts has done considerable damage to trees in Santa Barbara, Ventura and part of Los Angeles counties. Its cankers must be cut out and the scars disinfected, preferably with Bordeaux paste, according to Prof. H. S. Fawcett.

At the annual meeting of the Davis Almond Growers' Association held recently, the former officers were re-elected: President, G. W. Pierce; vice-president, O. B. Wilber; secretary and treasurer, Miss Louise Schmeiser; and representative to the State Exchange, G. W. Pierce.

DECIDUOUS AND DRIED FRUITS.

Tuscan peach canning at Selma is nearly over.

Sonoma county apple driers are very busy.

Prunes have been cracking badly in Santa Clara and Napa county orchards.

Italian imports of all kinds of our dried fruits, especially prunes, are on the considerable increase.

The Lincoln (Placer county) cooperative cannery is reported to have started the season's operations.

Pear rust mite has discolored the leaves of many Lake county trees this season. It is not regarded with alarm.

Offers of 3¾ cents for prunes and 8 cents for dried apricots were reported at the Grange meeting in San Jose last Saturday.

Big purchases of fruit are reported being made in the United States by representatives of large Argentine and Brazilian fruit companies.

The Monterey apple crop is estimated by horticultural commissioner to be even less than his recent 60 per cent figure.

Ontario, which produces about 61 per cent of the Canadian apple crop, will have a much smaller crop this year than last.

"Standard," "Fancy," and "B" are the three grades announced for apples packed by members of the Watsonville Apple Distributors.

A steamer load of California products including 60 carloads of dried fruits and raisins and 25 carloads of canned goods left this week for New York.

About ⅔ of the Shasta county prune crop of 1500-2000 tons is still in growers' control as reported by horticultural commissioner G. A. Lamiman.

About half of the 73 per cent Fresno county peach crop is still in the growers' control, according to Horticultural Commissioner F. P. Roullard.

Over a million deciduous nursery trees were inspected for Sonoma county this season, by Horticultural Commissioner O. E. Bremner. Only about 5 per cent were condemned.

Three carloads of Watsonville apples were shipped this week to Buenos Ayres. The same port is to take 20 cars of Sonoma county Gravensteins, to be shipped via New York.

Humboldt county apple growers have arranged a trial shipment to San Francisco of 1000 boxes of fancy quality. More later if the grading is O. K.

A number of Tulare peach growers organized last week to join the Tulare Growers' Ass'n which will can their crop. This is another one of several locals in the Ass'n.

About 900 tons of dried apricots are estimated for the Vacaville district. The drying is all done. Buyers there are offering considerably less than in Santa Clara county.

Apricots are rapidly replacing peaches in the Kerman district on account of prices and root knot, according to E. O. Amundsen. Lovell peaches are over full while Elbertas are about ¾ crop.

Half of the Jefferson plums in Sonoma county were lost by brown rot and about ⅓ of the prunes. San Benito county Moorparks were as bad or worse on weak, sick trees which have had a struggle with borers, aphids or other pests or diseases.

GRAPES AND SMALL FRUITS.

In the Kerman district Thompsons are reported a full crop and Malagas 70 per cent.

The fourth annual St. Helena Vintage Festival will be held Sept. 3, 4, 5, and 6.

The Selma Fruit Co. is reported to have started seeding raisins for a 15-carload order.

Over 2500 tons of 1914 raisins were sold last week for export to Europe. This is regarded as the forerunner of large orders.

The botrytis fungus worked on San Joaquin county grapes this year just enough to thin the berries, leaving the bunches practically full of large-sized, finest quality grapes.

The packing of Thompson Seedless grapes has commenced at the plant of the Stewart Fruit Company at Sanger; the company will ship out about 20 cars.

Postal cards in boxes of berries shipped to the central West through the Sebastopol Berry Growers for R. W. Thompson brought reports of arrival at several points in finest condition.

GRAIN AND FIELD CROPS.

Orange county sugar beets and beans are estimated at 20 per cent by the horticultural commissioner.

The 300 acres of the Carmel Cattle Company ranch at Wasco is said to have produced 23,000 sacks this season.

The Imperial Valley melon season is almost over; the shipment of 4726 cars of cantaloupes and 762 of watermelons broke all records.

The farmers of Fallon, Nev., are trying a new scheme, and that is drying and sacking grasshoppers for use as chick feed next spring.

Sweet potato crates have been breaking in shipment. A new railway rule requires that they be reinforced with iron or wire strips.

Cooler weather is said to have checked the shipments of melons from the Turlock district, reducing the daily average to 36 cars instead of 50.

Ninety bushels per acre of field corn from 200 acres in the island country of San Joaquin county was made last year, according to Farm Adviser F. F. Lyons.

It is reported that the Chualar district of Monterey county will have a larger yield of sugar beets this year than ever before, 18 to 20 tons per acre being expected.

The second crop of alfalfa in the Fallon, Nevada, district, is reported to be about harvested, with a two thirds to three-fourths crop on account of damage done by grasshoppers.

A corn contest is being carried on by members of the Agricultural High School Clubs of Orland and Willows; the former raising it on irrigated land, the latter under the dry land method.

On account of the large numbers of watermelons being marketed from Turlock, a slump has taken place in the Dinuba market; the price has gone down to $3 a ton from around $15.

A co-operative association for the purpose of marketing their product is being considered by the Richvale rice growers. The prospects are for the largest rice crop ever raised in that section.

A 30-acre cornfield near Terminous, San Joaquin county, yielded 1100 bags of 140 pounds shelled corn last season. Field corn planted there last May is now well tasseled.

One hundred and five thousand dollars for water to irrigate 15,000 acres of rice land in Glenn and Colusa counties has been offered the Sacramento Valley West Side Canal Company by rice growers of those counties. It is yet undecided whether the company will accept the proposition.

The Winter Vegetable Union was formally organized at San Diego on July 24, with 44 members to date, signing an acreage of 101 acres. The following men constitute the Board of Directors: W. R. Edwards, Chula Vista; H. Culbertson, El Cajon; W. M. Sharpe, Otay; J. S. Hull, Nestor; E. L. Owens, La Mesa; I. C. Robinson, Spring Valley; and J. S. Scott El Cajon.

MISCELLANEOUS.

The South San Joaquin District will hold a Community Fair at Manteca on October 8 and 9.

On July 29, the Stanislaus County Farm Bureau, composed of sixteen branches, held its first meeting with Farm Adviser Chas. M. Connor.

E. O. Amundsen, Farm Adviser for the Fresno Farms Co. of Kerman, is elected Farm Adviser for Placer county.

Members of the Agricultural High School clubs of Willows and Orland were recently visited by R. N. Hagen, Asst. State Leader in Boys' Agricultural Clubs.

Agriculture is to be included in the course of study at the Fresno Normal School this coming school year. A practical course has been taught under difficulties on the new grounds of the Los Angeles Normal during the past year.

SUGAR PRUNE ON PEACH.

To the Editor: I am budding over four acres of seven-year-old freestone peaches to sugar prunes. I cut back the trees and am budding on the sprouts. I have been told I was making a mistake by budding to sugar prunes as they would not do well, as the affinity was not right between the peach and sugar prune. Am I making a mistake? — J. V., Morgan Hill.

[This is one ahead of us. We have always considered the peach good for the sugar prune, when working-over is well done. We shall be very glad indeed to have reports of ill behavior if others have experienced it.—Editors.]

THE American Jersey Cattle Club wishes to obtain all the reliable data possible, as to what grade Jersey cows can do as butter producers. Such material will be very useful in demonstrating the great desirability of using pure-bred sires in ordinary dairy herds. If owners of grade Jersey cows can be induced to join testing associations and secure yearly butter fat records of such animals, a great deal of valuable information can be thus obtained for use by the club.

We hope to gather in the near future new, live material for advertising purposes, and shall endeavor to adopt an advertising policy that will make farmers not only think and talk about the Jersey cow, but convince them that she is the cow they ought to have. I am thoroughly convinced that if the vital convincing facts which can be obtained as to what the Jersey cow can and will do under ordinary everyday farm conditions, can be brought home to the attention of the dairy farmer, we can knock the very last life out of the word "but," that we so often hear now, when we attempt to discuss the Jersey cow with the dairy farmer in a community where other breeds are found.—W. D. Munn, New President of the American Jersey Cattle Club.

California's First Colt Show.

[Written for Pacific Rural Press.]

The local colt and horse show idea which was first advocated in California by the California Draft Horse Breeders' Association, is to have its first try-out at Rio Vista September 9. Through the aid of the Solano County Farm Adviser, at the suggestion of the State association, and by persistent work on the part of prominent horse breeders of Solano county, $400 has been subscribed to pay for prizes and entertainment. The Chamber of Commerce of Rio Vista and the Women's Improvement Club have also joined forces, and horse, finances, and publicity committees have been appointed.

According to Dr. A. F. Hanna, a member of the committee of five appointed by the Solano Farm Bureau to work up a horse show at Rio Vista, more mares have been bred in that vicinity the past year than any other one year in the past 20, and if all of the animals that have been promised are brought to the show, the town will be full of horses.

The show will be open to all comers and exhibitors of draft stock only, and it is expected there will be at least 80 head exhibited. There are about 20 local stallions available, 17 of which are purebred, and there is a great deal of high grade stock in the Montezuma hills and the river islands between which Rio Vista holds a commanding position. At least three Jacks are expected to compete and four men will show purebred draft mares.

Cash prizes only will be offered and there will be no entry fees. The committee hopes to secure a judge from the Panama-Pacific Exposition, and the stock show and judging will commence at 10:00 a. m.

In order to provide amusement for visitors, water sports, boxing, and other amusements are programmed for the afternoon and evening.

They propose to make the horse show an annual event, as the territory adjacent to Rio Vista is one of the large draft horse growing sections of the State; and by holding such shows, farmers and breeders will receive valuable information as to the best types, conformation, and breeding of draft stock.

Colt classes and boys' judging contests will be among the more important features. The committee is now at work making out the classifications, which will be published in these columns as soon as available.

For the benefit of those competing and attending the show, the committee advises us that visitors can get to Rio Vista by boat from either San Francisco or Sacramento, or by the Oakland and Antioch railroad, taking the stage from the railroad to Rio Vista direct. Automobile roads are also in fair condition for that class of travel.

STARTING A PURE-BRED HOG HERD.

"I am frequently asked for advice about starting a herd of purebred hogs in California," said W. S. Guilford, Director of Agriculture of the Sacramento Valley Irrigation Co. at Willows, California, an authority on hog growing, to a Pacific Rural Press representative.

"The breeders of purebred hogs in this State are progressive, and are producing as fine representatives of the various breeds as there are in the country. The foundation stock for the herds here has been selected with good judgment from the best herds in the East, and conditions here make it possible to constantly improve. Any desiring to buy purebred hogs can go to our best breeders and be confident that they can secure meritorious animals at reasonable prices," he continued.

"I know of one man who went to a California breeder for a small foundation herd and was priced a number of animals at modest prices. He did not buy them, but sent an order to the east, paying three times as much per head for individuals that, while good enough, and undoubtedly worth the money, were not as good as the home-bred ones, which by comparison were great bargains. This was demonstrated by the fact that the California animals were winners at one of the leading fairs in classes where the eastern hogs were not in the money. I do not mean by this that many high-class animals are not brought out from the East, for our breeders make frequent selections from the leading herds there—but the beginner, who does not want to go East to make his selections, and pay the high express rates, can buy satisfactorily from the local herds. I saw a lot of Berkshires recently at Butte City Ranch in Butte City, in Glenn county, that had been selected from the best herds in California and they are very superior individuals.

"The demand for purebred hogs in California is very good and the business of breeding them offers splendid opoprtunities for those who are equipped to breed and grow them properly and will advertise and conduct the enterprise as it should be."

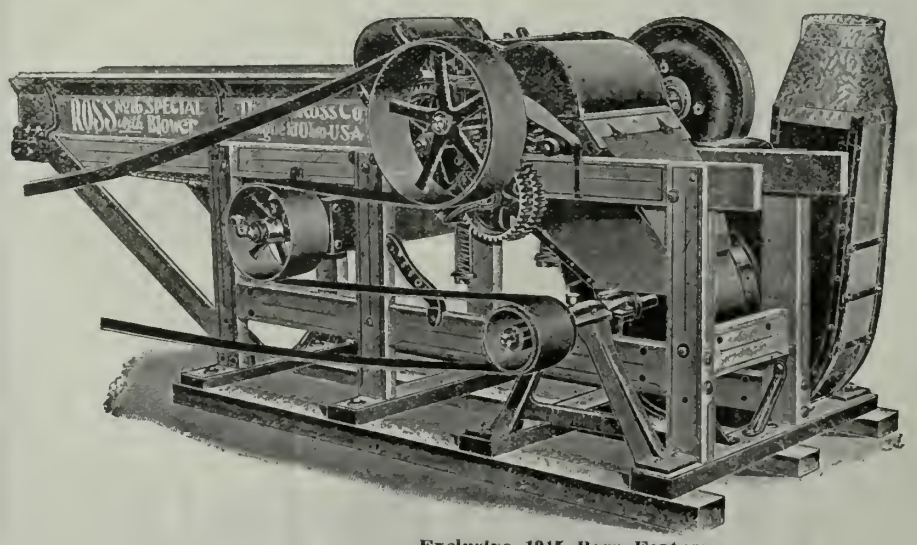
ANNUAL WOOL SHEARING.

To the Editor: The following is a communnication, dated June 30, received from Mr. S. B. Hollings, wool expert, Bradford, England, with reference to two fleeces of cross-bred wool that I sent him May 15, 1915, in order to get an expert opinion regarding the spinning count and the valuation, for comparison with U. S. prices. The fleeces were from Thornton Glide's flock at Davis, Calif. One was a Dorset-Rambouillet cross and the other a Shropshire-Rambouillet cross. The fleeces were of spring lambs that had been shorn in August and then again in March. The second clip, August to March growth, is the one in question.

Re the Dorset Horn-Rambouillet hogget. I like this by far the best. The staple is more compact, it shows 56's quality, which is really fine half-bred, and is a valuable fleece. The worst feature is the shortness of the staple. This should be at least four inches long, but being shorn last August and in March accounts for the shortness. It is most difficult to say the exact price of this fleece in London, but conclude it will be worth 32 to 34 cents per lb. In fact if it were longer and more like a twelve months grown fleece, such as we get from New Zealand, it would be worth today from 38 to 40 cents.

Regarding the Shropshire Rambouillet fleece, this is only 50's quality, the staple is more loose and fuzzy, and would go for lower class yarns. The value here is about 2c. per lb. less than the previous fleece. It is lighter in grease, but it lacks a little compactness.

I might say that both fleeces are essentially hosiery wools, although the first named could be easily used for carded woolens. Were I the owner of this flock I should discard both these crosses and on my Merino ewes I should use either the Romney Marsh, Lincoln, or Leicester ram. You would then get a bigger sheep, more valuable for mutton purposes, and I think on the whole a more valuable fleece of wool.—S. B. Hollings.



The above letter certainly has some points of interest to the wool grower of this country. In the first place, Mr. Hollings estimates that this wool would be worth 6 to 8 cents per lb. more were it of normal length or 12 months' growth. Wouldn't it be worth while to consider shearing once a year? He also terms it a hogget, although it has been shorn twice.

The most important item, however, is the different prices quoted in England and America. Similar wool in this country at the present time is selling for 24c. a lb. or a difference of 8 to 10c. in favor of Bradford prices. At that rate wool growers could almost afford to ship by parcel post and make money. There is a joker in the wool business. How can we get him out?

Note that Mr. Hollings strongly recommends the long wool, Romney Marsh, Leicester or Lincoln cross in preference to a Dorset or Shropshire.

Robert F. Miller.
University of California.

Ross Feed Cutters

The most complete line of Feed Cutters on the Pacific Coast.
2 Types—Cylinder and Knife on Fly Wheel.
18 Sizes.

The 36-inch machine here illustrated is the largest capacity and most powerful feed cutter made.

IF THE United States should be able to keep out of the war—and the indications are that it will not become involved—this country is likely to attain a position of supreme commercial importance before hostilities abroad are at an end. As indicating how remarkable the foreign trade figures are, for the fiscal year ending with June, it may be said that the excess of exports over imports this year was more than double that reported in the same months of 1914, while the largest previous export excess shown was $666,431,000 in 1908. What is very striking—and contrary to what has been generally regarded as the compelling influence—the unprecedented export balance this year was scarcely accounted for at all by 'war orders.' It was due primarily to the huge exports of grain and cotton."—Wells-Fargo Nevada National Bank, San Francisco.

Organization to Aid Stock Feeders.

To the Editor: The article entitled "What Thinking is Doing for Beef" appearing in the Press issue of the 17th ult. is one full of suggestion for the development of a great unorganized industry of the State. This subject has occupied my thoughts and has been a matter of study for the past two or three years in connection with my work. Do you not think that the time is ripe for the starting of an efficient organization that would "couple up the links between the breeder and the feeder," that would connect the unfed hay stack with the unfed "critter"? Of course, the problems are different, but I believe the meat industry would benefit by organization in its own way quite as much as have the citrus, raisin, and almond industries. Inasmuch as the Press has come to be a recognized factor in promoting the rural interests of California, I believe it could do a great good right now in assisting the birth of a California meat growers' association. I believe it could be made a clearing house of information and assistance to the small feeder and others that would at once effect the upbuilding and increase of the State's output. I would enjoy the further pursuance of this matter with you.—**Wm. Curtis Clark**, Oakland.

[Your suggestion of starting an efficient organization that would couple up the breeder and feeder is timely, as any one who is at all familiar with the alfalfa marketing problem in California today will admit.

As we have previously pointed out, it is no longer a problem of getting alfalfa growers interested in finishing the beef steer, but rather how to furnish them with feeders of the right kind.

Just what kind of a distributing and marketing system would best meet this growing demand is a much mooted question, but it is certain that the one now in vogue will not permit of much development along the lines previously outlined.

In the East, the union stock yard plan has furnished machinery for the buying and selling of feeders as well as the finished steer in large or small quantities by opening avenues for the commission merchant and livestock broker. Their markets have been the assembling point for all meat animals where the stockman could ship one or a hundred cars to market, receiving the market's quotation, less the charges of the commission man who handled them. This condition has also made it possible to assemble feeders at a central point from where they can be purchased in quantities to suit the farmer's condition.

It also has made it possible for the farmer to sell his feed through the steer without tying up any considerable amount of money. This is accomplished by the commission man or livestock loan company retaining ownership of the stock when shipped to the farmer, and requiring that it be consigned to him for marketing in its finished stage.

Theoretically at least, that system is preferable to ours for the reason that it creates a central distributing point and furnishes means for livestock loans, the two factors most badly needed by the farmer who would finish cattle in this State.

Whether the union stock yards' plan is the ideal one or not—and it should be said that our cattlemen do not generally think it is on account of the claim that it aids monopoly—it certainly solves many of the factors that are now confining the beef cattle industry of the State to the mountain range. For the welfare of the State, this should not be so.

The Rural Press will be glad to aid in any practicable solution of this problem, and courts a free expression of opinion from those of our subscribers who have convictions on the subject. As we previously pointed out, it is one phase of the livestock industry which is demanding thought—and thinking is the best thing on earth if done before action is taken rather than afterward. We feel it our duty to provide space on any agricultural subject that is the result of thought, even though it may not always meet with our own views, so our columns are opened for further discussion on this subject.—Editors.]

MILK AND MILK PRODUCTS LAW.

[Written for Pacific Rural Press.]

New laws are always more or less of an experiment until they have been put into practical operation, and such is the case with Assembly Bill 1549, which will take effect October 1, 1916, and whose object is to regulate the sale of all milk and milk products, except cheese, for human consumption.

The law proposes to prohibit the sale of any milk, cream, or by-products (except cheese) which have not been pasteurized by the holding process, or which were produced from other than tuberculin-tested cows, except to the wholesale trade.

Much adverse criticism of the law has been brought forward on the ground that it favors the large producer, who has sufficient capital to warrant the installation of pasteurizing plants, but works a hardship on the small dairyman who cannot afford the overhead expense of such a plant.

From the layman's viewpoint, the law would appear to work out in this manner: The dairyman who sells his milk to the city wholesaler will not be affected, as it is up to the wholesaler to pasteurize before distributing. The dairyman who sells milk direct to the producer will be required to either pasteurize or test his cows for tuberculosis. In most cases, it is probable that the latter method will be practiced, especially on dairies not large enough to warrant the installation of expensive pasteurizing machinery.

The law applies to by-products, including butter, and creameries will be required to pasteurize all cream used. This leaves the butterfat dairyman in practically his present position, except where farm butter is being made, in which case the dairyman will be placed in the same position of the larger creamery.

Where whole milk is being sold, it will be graded into four classifications: namely, certified, guaranteed, Grade A, and Grade B.

The law allows for an appropriation of $10,000 with which to defray the expense of inspection work, part of which will be done by the State Dairy Bureau and part by the State Veterinarian or his assistants.

Those desiring more detailed information regarding the law should write to Legislative Bill Clerk, State Capitol Bldg., Sacramento, for the law in full.

Yolo county dairymen recently attempted to secure a condensary. In working it up, data on available milk were secured. One herd of 90 cows was producing 14 cans daily. another of the same size was producing 50 cans or 500 gallons daily, though only ¼ of the latter cows were mature and ¼ were with their first or second calves. This dairyman has built up his herd by testing cows for butterfat and breeding from the high producers only.

DAIRYING.

San Francisco has been sending butter to Hongkong, via Sydney. This trade was formerly supplied by Australia.

The herd of Holsteins belonging to Heenan and Weldon of Sacramento will be sold at auction at Hanford September 15.

A Blanchi, who has been running a dairy and cheese ranch on the Stanislaus river, has bought the J. W. Watters ranch near Ripon.

H. G. Armstrong and Albert Welch of Woodland, who recently sold their milking herds, are going into the game again with young stock.

Choice of 100 registered Holsteins may be had Sept. 15 at the auction dispersal sale of T. J. Gilkerson of Stratford and Heenan and Weldmon of Sacramento, to be held at Hanford. Mr. Gilkerson expects to stay in the Holstein game.

A Holstein consignment sale will be held at Hanford Oct. 12. Among consignors are Hewitt and Hewitt of Hardwick, R. F. Guerin of Visalia, Alex. Whaley of Tulare, and J. McAllster, who is the sales manager. Ben Rhodes is the auctioneer.

The Woodland Farm Dairy sold at auction last Saturday its 200 Holstein-Guernsey cows, a Holstein bull, a Berkshire and a Duroc boar, and 40 brood sows. Fourteen horses and mules and 125 hogs and pigs were also sold. Nearly 900 people attended.

From the University of Missouri comes the report that Carlotta Pontiac, a Holstein owned by the Dairy Department of the University, has made what is believed to be the best three-year milk record ever made in that state. She has made an average yearly production for three years of 22,658 pounds.

The Gridley Cow Testing Ass'n has revealed the value of a Holstein which yielded 79.4 pounds fat in 30 days for T. F. Bonness. Kaiser Bros. of Biggs have a cow that yielded 62.16 pounds, and John Guill of Chico one that produced 54.11 pounds. One belonging to H. Wickman of Gridley made a record of over 50 pounds.

The following animals will be among those to be sold by McAlister & Son of Chino and A. W. Morris & Sons of Woodland at the State Fair Grounds, Sacramento, October 6 and 7: Uneeda Korndyke Abbie and Abble Korndyke Segis, both daughters of Johanna McKinley Segis, who sold for $25,000 and whose dam, Johanna De Kol Van Beers, is the world's record cow for 120 days, and she sold for $7,000, the highest price ever brought by a cow at public auction. The first of these cows consigned is the second highest daughter of her noted sire for both milk and butter, making over 28 pounds butter and 618 pounds milk in seven days, and the second cow has been proclaimed by men who know her as the best individual daughter of Johanna McKinley Segis; she recently made over 21 pounds butter as a three-year-old. Winnie Korndyke Cornucopia De Kol, a daughter of Aaggie Cornucopia Johanna Lad, the greatest sire of milk producers for seven days, is herself his second daughter, making 668.9 pounds milk in seven days and 98½ pounds milk in one day, will be sold. There will be over thirty other A. R. O. cows besides these in their consignment, each with a good record; and they will also offer the buyers at this sale an opportunity which has never been presented before at any public auction. They will sell about 20 granddaughters of King of the Pontiacs, sired by one of his very best bred and best individual sons, King Pontiac Topsy.

HORSES AND SWINE.

Thornton Glide of Davis is raising a big field of corn to finish his 90 hogs, and another bigger field to fill his silo.

E. W. Westgate of Rio Vista has given each of his boys a colt to raise. He believes horse shows should have boys' judging contests.

A. L. Stephenson of Los Molinos recently sold 17 pure bred Berkshires a month old, for $175, to the Butte City Ranch.

Napa is to have a colt show in connection with its Vintage Festival. Henry Wheatley will show his Shires and other purebreds will be there.

More mares have been bred in the Rio Vista district the past year than in any one of 20 years before, according to Dr. A. F. Hanna.

Pigs ought never to be grown on alfalfa or grass alone according to Farm Adviser N. P. Searles of Yolo county. It makes them potbellied like a drum with four legs on it.

An eight months purebred Berkshire sow was recently sold by A. L. Stephenson of Los Molinos to Mr. Hannan of Corning for $75. She weighed 305 pounds.

Ten purebred large type Poland-China hogs have been recently shipped to Honolulu by W. D. Trewhitt of Armona. These hogs will be used as a foundation for a herd. He has about 160 left.

Two cars of mules were recently purchased in the San Joaquin valley by C. Bailey of Hanford, representative of the purchasing agents of the European armies. It is said that $120 each was paid for the mules in the shipment.

There is a movement on to organize a new cow-testing association composed of about 700 Yolo cows and 300 Solano cows. The previous association in Yolo county was showing fine results when it discontinued recently because several of the largest dairymen sold their herds.

A dairyman fed his pigs skim milk and they developed a cough and thinness of meat. He killed some of them, found their organs rotten with tuberculosis, bought some more, sterilized the skim milk with steam before feeding it, and the new lot of pigs thrived as well as anybody's.

"We haven't been as successful fighting hog cholera as the other livestock diseases, because it is so difficult to get people to clean up

LIVESTOCK DIRECTORY.

BULLARD CO.—Breeders and Importers of Rambouillets, Hanford, Cal.

CHAS. KIMBLE—Breeder and Importer of Rambouillets, Hanford, Cal.

BISHOP BROS., SAN RAMON, CAL.—Breeders and Importers, Shropshires.

MISCELLANEOUS.

OWING TO THE MANY requests of our customers to give them information as to where they can buy or sell dairy stock, we have established a livestock bureau in connection with our office. For anything in this line, write us. V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

BREEDER of Registered Holsteins and Poland China Swine. E. E. Freeman, R. 5, Modesto, Cal.

their cholera-infected places," says State Veterinarian Chas. Keane. He plans to engage in a systematic statewide campaign within a few weeks.

N. C. Anderson of Rio Vista breeds a dozen mares annually, aiming to sell two or three span per year. These bring $650 to $700 per span at the ranch. He used Percheron sires until four or five years ago, since when Shires have had the preference on the high grade Percheron mares of his own raising.

The Farm Bureau of Glenn county is making a census of the hog and dairy industries through the various farm centers. From the information collected live-stock associations are to be formed. Among other things these associations will undertake to aid the purchase of purebred stock from the outside, will combat and try to keep out various contagious diseases, will interest itself in the interchange of livestock, the formation of cow-testing associations and in the marketing of live-stock products.

A purebred Berkshire boar was obtained from G. A. Murphy of Perkins and a purebred sow from A. B. Humphrey of Mayhews, by A. F. Leifer of the Natomas Consolidated reclamation district north of Sacramento a little over a year ago. He now has eight purebred young sows, has sold several boars already, two of them late in July. He plans to buy the best boar he can get for the young sows, "for it is as cheap to raise purebreds as grades" and lots more profitable. Mr. Leifer still has several head of high grades, which he will work out of, as fast as he can build up the purebred herd. Alfalfa and barley are the feeds. This is one way to get started in purebreds with very little capital. Some of this stock will very likely be at the State Fair next year.

CATTLE AND SHEEP.

Coyotes have been eating sheep in the Geyserville district of Sonoma county.

Coyotes are the cause of B. J. Reilly replacing his sheep with cattle, near Ukiah.

A Shorthorn view herd was recently sent to the Panama-Pacific from Omaha.

The Hopland Ranch has two purebred Shorthorn heifers at the Exposition.

Emery Fraser recently bought 2700 sheep, the whole outfit of a Mendocino county man, to be fed in the Rio Vista district.

A trainload of cattle was recently shipped to the Kansas City markets by Mitchell & Turman of Glenn county.

The San Joaquin dairy exhibit in the California building contains a pair of steer horns that measure six feet across.

Snails taken in the drinking water clogged the livers and killed about 400 sheep for Simpson Finnell of Yountville, Napa county, during the past two months.

Claude Keeran of San Antonio, Tex., has been visiting his birthplace near Stockton. He is a large cattle holder at home.

Le Grand was the shipping point for six carloads of about 170 cattle recently. W. G. Turner and the Raynor Bros. were the shippers.

Joseph Clark of Mendocino county has sold 10,000 pounds of spring wool at 29 cents, the highest price paid in years.

Peter Cook says that one who raises 3000 acres of grain ought to have lowland summer pasture and highland winter pasture for 5,000 sheep which would be fattened on the waste grain.

Cattle are especially fond of sudan grass if it is cut for hay immediately after the heads come out, according to E. C. Voorhies of University Farm. Its stalks are then full of a sweetish juice.

Selling beef cattle to the local meat market at Ukiah proved profitable recently for E. M. Coble of Potter valley, who sold four, the English Ranch people who sold 20, and the Gibson Ranch of Two Rivers, whence came 60 head.

"No danger but that the small farmer can sell his surplus sheep to the local butcher," says Peter Cook of Rio Vista. This is exemplified by the sale to Chas. Ward of Ukiah of 20 head each, by E. Gambrel and Leslie Crawford.

That show condition for bulls is not considered breeding condition by Thornton Glide of Davis, is proved by the lack of covering, which makes 7-year-old King Lancaster, thrice grand champion at the State Fair, look rather rough but "in best breeding condition now."

MISCELLANEOUS.

A local livestock and farm products fair is to be held at Manteca Oct. 8 and 9.

The Kerman district of Fresno county is getting more stock to eat low-priced alfalfa—$4 per ton at the mill.

The Union Stock Yards Co. of Chicago is offering prizes of $50, $40, $30, $20, and $10 for the best fed cattle, sheep and hogs raised by boys under 16 years old.

Loose alfalfa is selling at $4 to $5 in the field around Tulare. Shipments of 8 to 10 cars daily are said to be made to New York from Goshen.

A representative of the Napa Dairymen's Association is in Santa Rosa to secure 300 cows for the association. It now has 700, but to pay best there should be 1000 animals in the association.

Fruit, grain, and stock are to supplement each other on the 550-acre D. W. Ide ranch out of Red Bluff, recently purchased by Dr. E. E. Thompson of Red Bluff and W. H. Samson of Corning. Cattle and sheep on the grazing land, pears and prunes on 100 acres, grain on the rest.

Cattle, calves, and sheep are said to be sacrificed to butchers in England on account of high prices of feed. It is reported that breeding stock is going too. Great opportunity for purebred livestock breeders of America to restock them after the war. It is suggested that breeders be paid a subsidy to keep herds intact.

REMEDY FOR SORE EYES.

[Written for Pacific Rural Press.]

"Feeding cattle first crop alfalfa in overhead racks is exceedingly dangerous to their eyes, for the foxtail beards penetrate and very often start a cataract-like growth which sometimes makes the animals entirely blind," says E. C. Voorhies of the University Farm.

"Sometimes these beards can be pulled out with forceps or even with the fingers. If the growth has started, the best thing in the world to do, as we have worked it out here, is to put a little iodine on a piece of cotton, if the growth is bad, and just touch it; be careful not to get too much on or it will burn the eye and blind the animal.

"As soon as the iodine is on apply three or four drops of pyokuanin made by Park, Davis & Company with any kind of a medicine dropper. It is the finest thing we have found to cure up sore eyes."

DRIED BEET PULP WITH ALFALFA.

To the Editor: How is the best way to feed beet pulp to dairy cows; should it be fed dry or soaked first; how much for each cow with alfalfa hay?—W. F. Stroble, Ripon.

[Answered by Edw. C. Voorhies.]

Beet pulp can be fed either wet or dry to dairy cattle. Where succulent feed is provided it probably will be more convenient to feed the beet pulp dry. However, where no succulence is present, as is the case when feeding alfalfa hay, it is probably best to soak the pulp before feeding it, in order to provide some succulence.

We usually recommend that a dairy cow be given one pound of concentrates, such as beet pulp, or other concentrates, for every five or six pounds of milk that the animal gives. This is rather a rough guide, but it answers the purpose very nicely.

The Cascade International Live Stock Show will be held some time in November at North Yakima, Washington.

Great losses from hog cholera are reported from the Yuma district of Arizona.

Copro

Cocoanut Oil Cake Meal In Its Purest Form

Be Sure the Copro Brand Is Stamped on Every Sack

Copro contains 16.4% Protein, practically all digestible, consequently the percentage of waste in assimilation is small. Because of this fact it is the most economical food to buy for Dairy Cows, Hogs and Poultry. Place your order now.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

MULE WEAK IN HIND LEGS.

To the Editor: What can be done for a mule which gets down and cannot get up for 24 to 48 hours? He seems weak in the hind legs; after attempting to rise fall back with a groan as if exhausted. He had a sore on his rump which seems hard to heal. As yet I am able to get blood pus from it by just pressing around the skin gently. Have given him flaxseed and salts and his bowels seem to move fairly well.—B. L. B., Modesto.

[Give this mule the following: potassium iodide 2 oz., water one quart; dose, 2 oz. twice a day.]

COW WON'T BREED.

To the Editor: Our cow has been to the bull four times and is not with calf now. Kindly let me know what is the best thing to do as she is a first-class Holstein cow; not pure-bred but a good grade. She was fresh last February.—R. D. P., Turlock.

[Douch this cow with a gallon of water daily containing 1 drachm potassium permanganate for two weeks previously to the heat period. After service introduce the arm, which has been previously washed, and try to introduce some of the semen into the mouth of the womb.]

PIG COUGHS.

To the Editor: I have a registered hog about five months old. He has had a cough for the last two months; coughs up phlegm four or five times a day, otherwise seems perfectly healthy; is fat and thriving well. Will this cough leave him, or can you advise me what to do for it?—W. E. W., Hollister.

[Give this pig a teaspoonful spirits of camphor once a day for one week.]

BLOODY MILK.

To the Editor: We have a cow that was fresh Mar. 22; the udder was hard and we treated it with camphor and vaseline which quickly relieved the trouble. She was bred May 21; about June 15 we noticed blood in the bottom of the pans after standing. We discovered it was coming from the left hind teat. We gave her saltpeter; she seemed better for a time, then she commenced giving bloody milk from two teats. We gave her potassium iodide as prescribed in the Press of May 1; for a week we saw no blood; now she is giving blood from three teats, and it comes in hard lumps from the left hind teat. When nearly dry it is almost clear blood. We keep the milk from each teat separate. She seems perfectly well; eats heartily; is fed good alfalfa hay three times a day, one-half bucket of bran twice a day; she gives four and one-half gallons milk per day now; she gave a gallon per day when fresh.—A. B. R., Oakley.

[This is due to infection which is so deep seated that drugs seem to be of no avail. Have an autogenous vaccine made from a sample of her milk by the Western Laboratories, Oakland. This should be administered by a competent veterinarian.]

PROPERLY FED HOGS PAY.

[Written for Pacific Rural Press.]

One of the largest dairymen in Yolo county is feeding his pigs with surplus skim milk after the calves have had all they want. He admits that the pigs would do better if they received some barley in addition to the skim milk, but has simply not gotten around to it. When the butcher kills these hogs the per cent of dressed meat will be much smaller than if they were fed some grain all the time. The butcher knows that, and consequently pays a price commensurate with their worth at the block. The annual loss from improper feeding of hogs will be overcome when the grower realizes more fully the difference in revenue for all concerned of the properly and improperly fed hog.

RELATION OF BUTTER MARKETS TO DAIRYING.

(Continued from page 121.)

to blame for the deplorable fact that our butter, as a whole, is so poor in quality and uniformity (when compared with other territories) as to render it unfit for competitive selling at a fair price, although both disown the responsibility.

This shifting of responsibility onto the other fellow's shoulders is not conducive to market development as we already know, and before our marketing troubles can be solved an active campaign of education must be conducted, which will make every offender responsible for his deeds.

Several avenues are open for such education, all of them necesary and practicable for their particular purposes; but all revolving around the dairyman, who holds in his hand the future of the marketing problem.

This educational work might be put into three classifications for illustration purposes: first, just payment for quality by the manufacturer; second, extension work by the University of California to show dairymen the dire need of quality and how to get it; and third, police duty by the State to insure compliance with existing laws.

Experience here, as elsewhere, shows that payment for quality by the manufacturer will create the most direct and lasting results. It not only brings into the folds of better quality that dairyman who is anxious and takes pride in producing and selling good cream, but also a large majority of those dairymen who follow the dollar wherever it goes.

Again, experience shows that our State Universities have the means at their disposal of exerting great influence in the betterment of dairy practices and products, and surely we have both a just cause and a most efficient University in this State to carry on the work.

If both of the above agencies would direct a campaign of education along lines as outlined, the police duty would be of minor importance, reverting more into an advisory department, except in rare instances where neither pride or money commanded respect. We all know that it is far better for a citizen to carry on his business with the least possible amount of police supervision, no matter how conservatively that policing may be done.

The Money Gain. — In reviewing the past year's butter market, it is commonly granted that a 20-cent market would have prevailed rather than a 23 or 24 cent market but for Australia's drought. It is further asserted by our best posted butter distributors that a 20-cent market will prevail next year and succeeding years unless direct action is taken to better conditions. Considering this on the basis of 60 million pounds of butter annually, which was the production in 1914, this three cents differential means an annual loss of $1,800,000 on butter alone. Market milk, cheese, and condensed milk, being based on butter quotations, will suffer likewise. The question remains: Are we to see the dairy industry stagnate for lack of quality or are we going to awaken to the dangers ahead? No longer can we say, "That will come in time." It is here, and a reality.

Cheese Possibilities Good. — We have referred in the above to cheese, mentioning that it also offers possibilities to the dairy industry. Generally speaking, these possibilities are lying dormant or are being developed in a poor and negligent way at best.

The present production of cheese in California is in round numbers five million pounds less than we consume, and sells at three to five cents less than cheese manufactured in the Middle West. At the present time, there are one quarter of a million pounds of California cheese held in storage from last year's make, which is of such poor quality that it cannot find a market. In other words, our cheese is on the whole of such a poor quality that our own markets cannot successfully cope with it. The State law requires that every cheese manufactured in the State carry the name of California cheese. That name is today a liability in every market rather than an asset.

That such a marketing condition is not fair to the cheese possibilities of the State is evidenced by two instances in mind. In awarding prizes for cheese at the Panama-Pacific Exposition, one brand of California cheese received as high a scoring as the New York cheese entered. The California product was from a Coast dairy section and was manufactured by a cheese maker who has made a study of the business.

This is significant in connection with the results of a close inspection last spring of our cheese possibilities on the Coast by C. F. Doane, who is connected with the Dairy Division of the U. S. Dept. Agr. After visiting all of the Coast dairy sections in California, from Santa Barbara to the Oregon line, Mr. Doane reported to a San Francisco friend that nowhere, so far as he knew, were feed and climatical conditions so favorable for the production of fine quality cheese as in those sections mentioned. He added that the chief requisite is to place our cheese-making upon a more scientific basis, inasmuch as the manufacture of good cheese cannot be successfully accomplished with the antiquated methods now largely in use.

Improved Methods Needed. — Fewer farm factories and more custom factories, with competent cheese makers who have followed the latest developments in scientific methods, are needed. Also, the law which now handicaps the good cheese manufacturer should be changed to give him a chance for fair competition in our own as well as distant markets.

The above statement of facts regarding the dairy industry is put forth at this time as the objectionable feature of our present system, with the full realization that no other kind of farm endeavor will bring greater prosperity to the individual or the State than the dairy industry and that this industry offers vast opportunities for development; also, with a firm conviction that the future lies largely in our laying of a firm foundation in the butter markets we will in the future be largely dependent upon.

Expensive equipment is not necessary in the production of high producing cows, according to A. W. Morris of Woodland, whose three world's champion milk producers and relatively inexpensive equipment prove the case.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. Alfalfa Freight Rates East.

Southerners Want Our Alfalfa Hay, but the Freight Makes the Price Too High for them to buy. This is good for California if it Forces us to Feed it to Livestock.

To the Editor: In your article on shipping alfalfa through the Panama Canal, we note the statement, "Another steamship company points out the immense field to be supplied in the Gulf States with California alfalfa hay, for the dairy cows are increasing in that section." Now, can you tell me how I can go about it to find a buyer in the Gulf States for our alfalfa hay. With our own, and that of our neighbors, we will doubtless have 300 tons to dispose of. What is being paid in the Southeast?—E. S., Los Molinos.

[We have taken this up with dealers in various points of the southern states, and have the following answers to our questions:

W. S. Duncan Company of Atlanta, Ga., writes: "I have just returned from a long trip through southern California and up to San Francisco through the Valley, and I am sure that you have some very fine alfalfa hay growing. We are paying here now about $18.50 per ton for choice alfalfa and $16.50 for No. 1. We get this from Mississippi at present. The freight would be so heavy it would not be practicable for you to ship hay so far when we could otherwise use California alfalfa a little later in the season."

The Benedict Commission Company of New Orleans, La., writes: "If you can name us a satisfactory price for shipment via Canal we would be in a position to use large quantities of alfalfa hay; also alfafa meal. We are not familiar with the staple or quality of California alfalfa and would suggest that you send a large sample of same by express. The prevailing price on this market at present is $15.50 per ton for choice pea green alfalfa. Kindly let us know the average weight per bale and also the weight on the double compressed alfalfa, as it may be that we can work some of this double compressed to good advantage for export; and we would be pleased to have you put us in touch with any of your shippers who will be in a position to make shipment either via rail or water to New Orleans, but the terms would have to be margin drafts, allow inspection, payable on arrival."

The Jacksonville, Fla., Chamber of Commerce sends us the following from F. Saussy & Co., large merchandise brokers of that city: "As far as Jacksonville is concerned, there will be no chance to sell any of that hay, as it will be brought from the Pacific Coast by boats. Most of the alfalfa hay such as is referred to in your letter reaches this market from Arizona and Colorado. While the Oklahoma and Kansas hay in our opinion is not superior in quality as this hay grown in the irrigated sections, it nevertheless supplies the small demand of this market for alfalfa. This market has never seen any double compressed bales, but if the average weight per bale is in conformity to that shipped from the points referred to in this letter it would not make an excess bale, as the average weight of western alfalfa that reaches this market is around 50 to 60 pounds to the bale. As you know, Jacksonville is hardly in position at present to handle straight cargoes of alfalfa hay, and until we can get steamers bringing miscellaneous cargoes to Jacksonville from the Pacific Coast, the question of disposing of Sacramento Valley alfafa in this territory is one of remote handling. Our merchants as a rule prefer hay over rail transportation rather than water transportation; we have had several experiences on water transportation hay, and they have been far from satisfactory. We do not believe that there has been the progressive development in the use of alfalfa hay on this market that looked possible when it was first being offered for sale; one trouble with alfalfa is that it is very wasteful in handling and it is very poorly baled by the shippers, and very considerable profits have to be made for the buyers to handle it in any volume. We have never understood why the shippers do not pay more strict attention to the proper baling of their hay."

The Chairsell Grain and Feed Company of Birmingham, Ala., write: "A great deal of alfalfa is used here, but it is mostly from Mississippi and Alabama, as it is much cheaper than western. It is sold delivered here at $15.50 to $17 per ton. It would not pay to ship California alfalfa here now, but this fall and winter we may be able to handle some. If we can, we will be glad to do so. Last year Kansas, Colorado, New Mexico, and other states shipped alfalfa to this point, but this year Mississippi and Alabama have been furnishing nearly all. The quality is improving each year. This fall I expect the majority of alfalfa from the South will be already sold; thus we will have to go West for it. We have been offered Kansas alfalfa for $18.50, but can't sell it, as the southern alfalfa can be bought for less money. The price will be the only thing that will keep the California alfalfa out of this market. Everybody admits that the western alfalfa is rich, but the price cuts quite a figure this year. We hope this fall and winter we can do some business with your people. Would this hay be shipped from Sacramento, or what point? We would like to get the freight rate and the prices of alfalfa to see what could be done. We would like to handle some if we could."

In regard to the rates on alfalfa to these points, the Southern Pacific Company advises us as follows: "Rate on hay, carloads, in bales tightly compressed from central and northern California points to Birmingham and Mobile, Ala.; Omaha, Neb.; and New Orleans, La., is $1 per 100 lbs., minimum weight 24,000 lbs. The rate to Omaha, Neb., and New Orleans, La., carloads, on hay in bales compressed to a density of 24 lbs. per cu. ft. is 60 cents per 100 lbs., minimum 50,000 lbs."

The 60-cent rate is quoted on hay compressed to the same volume per ton as the steamer companies quote their rates on by way of the Panama Canal, as mentioned in the other article. This is too much to be acceptable to the eastern buyers, as noted in one of the communications. The $1 rate on ordinary bales means $20 freight per ton, which would put a crimp in the ambitions of alfalfa growers, were it not for the tremendous advantage to be gained by feeding their alfalfa to cattle and hogs on the farms where it is grown. The practical embargo on alfalfa shipments out of the State, due to the high freight rate, is a blessing in disguise if it leads our alfalfa growers to feed their hay to their own stock.

Sheep scab in Sonoma and Mendocino counties has engaged attention of the State Veterinarian recently.

THE CUTTER LABORATORY, Berkeley, California

CAN we afford to pay double price for hall-hatched chicks; is a chick hatched in September, October, November, or December worth two chicks hatched in the spring? I. H. Severence, who has had thirty years' experience in hatching and rearing chicks right here in California, believes they are worth double the value of spring chicks and makes an unqualified statement to that effect.

Hatch Chicks This Fall.

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n of California.]

Several settlers, recent arrivals from eastern states, have expressed deep interest in the articles relating to fall hatching of chicks, but all have grave doubts whether their particular localities could be included in the list of districts that were favorable for this—to them—strange undertaking. We can readily understand why they should feel uncertain as to results; it required several years for us to become convinced that nearly everywhere in California fall hatching could be successfully conducted.

In the following statement, I. H. Severence in a few short sentences gives the result of his thirty years' experience. Mr. Severence says: "Not back East or elsewhere, but right here on the Pacific Coast, thirty years' experience has taught me that the best results—and is it not that which we are all striving for?—are to be attained by fall hatching. Yes, I know the cry about 'the price of eggs being out of sight,' but has not no less a man than E. R. Philo been trying to drill into the mind of the general public that as like produces like, so fall-hatched chicks will in turn be fall layers? And that greatest of naturalists, Darwin, said the same thing long before Philo was ever heard of. Then they tell me, 'My hens don't lay in the fall.' Sell them, and get some that do. The hens I am now caring for have been molting heavy all through June and July, and if they are not laying well in September and October it is because the bottom has fallen out of the wheat bin; and the owner's pocketbook, too. In other words, feed 'full and plenty,' for new feathers are not made out of air. As I am intimately acquainted with California from Yreka to Bakersfield and Susanville to Santa Barbara—which is a long stretch of country—yet in all I know of no place where I could not hatch and raise fall chicks. Having had experience in so many counties and in lots running into the thousands; also hatching every month in the year, both by incubator and by the hen, I have found that the best results were from September, October, and November eggs because more eggs hatched and more chicks lived and grew larger and stronger than any March or April chick I ever hatched. However, I have had January eggs hatch in February that the pullets, Plymouth Rocks, laid in four months to a day; and cockerels, Orpingtons, weighed five pounds in the same length of time, yet the mortality among them was greater than those hatched before January. A fall hatched chick is worth two hatched in the spring."

Now is the Time to Feed
Coulson's Egg Food
to your pullets as well as your hens, commencing at the age of three months.

FOWLS POISONED BY NIGHT-SHADE.

To the Editor: Quite a number of my chickens, half grown as well as matured fowls, are acting in a strange manner. They seem unable to pick up their food, stand about with a peculiar look in their eyes, and at times attempt to run backward. I had them in small runs provided with litter for scratching and in addition to the grain and mash, fed them until lately with garden greens. When the green stuff ran low, I turned them out to hunt what greens they could find in a small creek bed that is near the poultry yards. Can you tell me what is the cause and a remedy for this trouble? —Mrs. J. S., Niles.

[Your fowls have been eating the leaves of deadly night-shade—Atropia Belladonna—a small plant with reddish, bell-shaped flowers, and shining black berries; it grows in just such places as you describe. The drug, belladonna, is made from the leaves and roots—the whole plant is poisonous. It may assist to identify the plant to state that the flowers somewhat resemble the bloom of potato plants. It is closely related to the potato, tomato, egg-plant, tobacco, and about 1000 other wild and cultivated plants.

The trouble may be avoided by either searching out and destroying the plants or by serving the fowls a proper supply of wholesome green stuff. The fowls eat the poisonous plant only when other greens are scarce. In the vicinity of San Francisco, Oakland, and the adjacent foothills, the poultry keepers at this season have frequent unpleasant experiences with this plant. When taken in hand promptly, the affected fowls may usually be saved.

Ernest E. Silva, proprietor of the Corner Drug Store, Fruitvale, states that in his experience the following remedy seems the simplest to use and which has generally produced the most satisfactory results. Mr. Silva says: "Make an infusion or tea of galls in which, while lukewarm, dip the fowl's head several times, using care not to strangle it. This gives prompt relief except to the throat. After drying the fowl's head, swab the throat with one drop of tincture of iodine. A swab may be quickly made by twisting a very small portion of cotton on the end of a toothpick. The galls of any animals may be used. We keep a constant supply of galls on hand because of an unusual demand here, but many druggists would not have them. They may be obtained fresh from a butcher. Simply pour boiling water on them and let them steep in it until the temperature is reduced low enough to feel comfortable to the hand. Unless the fowl is very seriously affected, one application is sufficient."]

RABBITS NEGLECT YOUNG.

To the Editor: Three of my does have twice refused to make nests for their young, and have either neglected or eaten them all. Can you tell me the reason? I feed rolled barley, alfalfa hay, and a little green stuff. —W. C. M., Rivera.

[Answered by Mrs. B. H. Gilkey, Santa Rosa.]

[Not knowing full particulars as to the treatment you give your rabbits, I cannot absolutely state the cause of your trouble. But this I do know; if a doe is given bedding before the middle of her time, say on the tenth day, she will in all probability prepare her bed about the fifteenth day. Should she do this, never disturb her. Keep her pen clean, leaving the nest intact. When the young are born remove all inferior sized or dead ones. I would advise straw or oat hay or any clean dry stuff free from mildew in place of alfalfa hay. Give water and green stuff, avoiding cabbage and celery or decayed vegetables. Pears and apples are relished, but if given in quantities they are apt to gorge themselves and die suddenly; rolled barley or wheat is all right. Dry alfalfa tends to paunchiness; green alfalfa is fine.]

"I'm so happy," she said. "Ever since my engagement to Charlie, the whole world seems different. I do not seem to be in dull prosaic Eastbourne, but in—" "Lapland," suggested the small brother.—Tid-Bits.

WRITTEN TO TEACH BETTER POULTRY METHODS ON THE FARM.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"'It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 43 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers
525 Market Street, San Francisco, Cal.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Sweysgood, Pomona.]

MOLTING TIME.

August is the month when our poultry is commencing in earnest to shed the old coat of feathers preparatory to putting on the new. Molting is a natural condition, and if the hens are healthy and are fed right they will go through with it in a natural manner. The time can be made long or short according to the care that is given. I have had hens laying again in sixty days from the time the first feathers were shed, and anyone can do the same providing the hens are healthy to begin with.

Dip Hens.—As a preliminary help to the molt, I dip the hens; it frees them of all vermin and seems to give the skin a cleansing that helps. It softens and greases, at the same time cleans the skin of scurf and dirt that has been accumulating. Most of the preparations put up by poultry supply dealers will do the work, but I like one best that will emulsify the water. Such a preparation is healing and helps the molt considerably.

Two People Do the Work.—When using it two people can do better than one, because the dipper can't very well keep wiping his hands to go after a chicken. Two weeks ago I dipped over 300 hens in two half days with the aid of a helper. The hens were driven into a house, generally the house they roost in, as we took one yard at a time. I had the dip in the wash boiler; directions called for one part of the dip to 25 parts water, but when I put the first hen in I knew it was too strong, so I added two gallons warm water. As the helper passed a hen to me, I took it by the legs and head; the head being held in the right hand, the legs in the left hand, and in this way I soused the hen in the wash boiler, keeping the head out of the liquid all the time as it is too keen for the eyes. By the side of the wash boiler I had a large zinc pail and the hen was put in this pail for just a minute to let some of the dip drain from the feathers; then she was thrown on a bed of alfalfa hay where she could lie, sit, or stand as the fancy took her. As a rule she gave her feathers a shake or two and walked off about her business.

Hens Get New Skin.—The hens get a new, clean skin along with the new feathers and they feel good and do good after it. Of course, there is a little danger attending it; for instance, I lost one fine young cockerel. Either the water was a little too warm or his heart was weak; anyway, he gave up the ghost. If his heart was weak he was just as well dead anyway these strenuous times, so it is a case of survival of the fittest. One old fellow five years old stood it and came out crowing.

Clean Houses.—Next to having the hens dipped be sure your houses are free of mites and ticks. "The Petaluma Poultry Journal" has been investigating the habits of ticks, and Professor Ward, formerly of California University, says specimens have been known to live over two years in an empty building and then attack hens when put in. I know from my own experience that mites will live over that length of time and then do lots of mischief before they are found out. So before dipping the hens, it is well to spray or fumigate all the houses; then the hens have a fair show to molt, and as a rule they lose no time when the proper feed is supplied.

Feed Mineral Matter.—The feed for molting does not differ a great deal from the usual egg feed; but as feathers are composed chiefly of mineral matter this should be kept in mind when feeding. Plenty of green feed, alfalfa, kale, cabbage, rape, or most anything that is tender and digestible will be found beneficial. This will supply the mineral from the vegetable world; but animal mineral figures very largely in the making of feathers and this must be supplied by meat, bone, and any other form of animal food we can get, always looking to the digestible amount that can be gotten. A good brand of fish meal is as good as anything because it is easier to digest than some other forms of animal food; for a change, a little beef tallow dissolved in hot water and mixed with the mash is helpful. The careful feeder who observes his hens will soon detect what is missing from the ration; and while molting a hen needs all the nourishing food she can get. I know many poultrymen who are penny wise and pound foolish, and who think the molting season is a time to economize; therefore, they feed just as little as possible, which merely serves to keep the hens alive and nothing more. Common sense ought to tell them that they are robbing themselves and that the hens don't care a cent about it either way. It is not a case of sentiment with me, but business; I can't afford to feed and shelter hens that don't pay their own board. But if they are not fed, how can they be expected to pay their board?

Flaxseed meal is another good aid to molting, but with all these rich feeds it is necessary to use good judgment; it must not be over-done, as any or all of them may bring on a too loose condition of the bowels; therefore, the droppings must be watched and at the first indication of looseness reduce the quantity of meat, grease, or whatever is causing the trouble.

Years ago we used to get pretty good crackings from the butchers, but now they get every bit of grease and good out of them with pressure, and what is left has very little, if any, value. It may be as good as beef scrap, but it is not near so handy to use, so it is just as well to let them keep them, and put the money into fish meal, bone, and beef scrap.

Get Rid of Useless Stock.—Don't forget that this is a good time to cull out all stock that are not worth carrying over; no use to feed them if they are to be sold before winter. The old hens should be fattened up and as many of them used for the table as possible. Most farmers have more or less of a family and there is not anything in the world better for a family dinner than a good chicken pot pie.

If you never tried adding a cup of cream to the gravy after the pie is taken from the oven, do so, and you will be surprised at the improvement. It takes away all greasy taste and makes a person feel like asking for more.

Keep the pullets growing; better get rid of old hens and feed the pullets if you can't feed both, for when the eggs are wanted in winter you will naturally have none if you play the game of robbing Peter to pay Paul. I believe in feeding anything that is under my care; if it won't pay to feed, it is a cinch it won't pay to starve any growing thing. Old animals or poultry can stand starving better than young ones can, for with the young, Nature has to grow the frame as well as keep the organism in condition. So if we must sacrifice one, let it be the old ones and do it in a way that is profitable.

Give Plenty of Water.—There is just one other item that should be mentioned in the matter of helping the molt, and that is water. Water serves a great need in the fowl's organism; and in this case when the system is being drawn on for a coat of new feathers there is more or less feverishness and that condition calls for water. The fresher and cooler it is, the better will it serve to keep the hens in a good healthy condition. Yes, there is still another, and maybe many more little helps that we might give the hens, but just this one is all I am going to mention this time. That is, for yarded hens, keep the dropped feathers raked up and either burn or bury in the ground and make fertilizer of them. If left lying around day after day in the hot sun, they commence to smell bad, besides being an ever-present temptation to hens that are inactive to form a habit of feather eating.

GOOD GUESSING GAME.

Cities and Their Nicknames.

1. Boston—"The Hub."
2. Philadelphia—The City of Homes."
3. Detroit—"The City of Straits."
4. Cincinnati—"Queen City of the West."
5. Chicago—"Windy City" or "Garden City."
6. Buffalo—"Queen City."
7. Cleveland—"Forest City."
8. Pittsburg—"Smoky City."
9. Washington — "City of Magnificent Distances."
10. Milwaukee—"Cream City."
11. New York—"Gotham."
12. Minneapolis—"Falls City."
13. St. Louis—"Mound City."
14. San Francisco — "Golden Gate."
15. New Orleans — "Crescent City."

Distribute slips, among the guests of a party, bearing the names of the cities and ask them to write out the nickname for each city.

A small girl of three years suddenly burst out crying at the dinner-table. "Why, Ethel," said her mother, "what is the thouble?" "Oh," whined Ethel, "my teeth stepped on my tongue."

NEARLY TEN.

When a body comes to be nearly ten,
Ah! all sorts of troubles beset her then.
At least, if the body happens to be
The eldest of all in the family,
Whose mother's at work the whole of the day;
And I'm that body, I may as well say!

There isn't a body in all our street
Who's nearly as pretty, or half as sweet
As our little Sally; but oh, dear me!
It's strange how heavy that baby can be.
And Tommy's a wonderful boy, I know;
But sometimes that child does bother me so.

It's "Hush-a-bye baby," and off she goes;
But, if I put her down, that baby knows.
And, as soon as she's really fast asleep,
Then down on the floor our Tommy will creep.
And it's—"Don't wake baby, be quiet, do";
Or—"Tommy, you'll pull that cat's tail in two."

But, perhaps, when a body's worn out quite,
Her dear little mother will come in sight.
Then it's—"Polly, my pet, what should I do
If I hadn't a good little girl like you?"
And, somehow, a body feels glad just then
She's a grown-up girl of nearly ten!
—Cassel's Little Folks.

DOLLIE'S COMPOSITION.

[By Kate Hudson.]

The minute her young niece had laid aside her hat Aunt Kittie's quick eyes detected the worry-wrinkles criss-crossing Dollie's forehead.

"What is it, honey?" she asked. "Fractions or dates?" Then the storm burst.

"O, auntie!" wailed Dollie; "ever and ever so much worse than the two of them put together! It's a composition of Lincoln—on 'Lincoln and his Times,' if you please—and I just perfectly despise compositions, 'specially about folks. And there's nothing about when Lincoln used to be President in any of my books——not in my history nor in any of my readers—and even if there were we're not supposed to copy, anyway. How in the world am I going to write it, and what in the world am I going to do?" Dollie winked away a big, round, very salty tear.

"Oh, well," said auntie, cheerily, "maybe we can get some information without reading up; but now, dearie, we'll make ourselves a bit neat for a very early supper so that Uncle Zach and Aunt Loretta, who've been spending the afternoon with grandma, can get home betimes."

Company and supper put Dollie's woes quite out of her head until, when the peach marmalade and cake were making their second round, Aunt Kittie suddenly wanted to know!—

"When did you say you have to hand in that paper on Abraham Lincoln, Dollie?"

"Oh, dear!" groaned Dollie; but before she could reply, Uncle Zach, dear grandmother's oldest brother, spoke up eagerly:—

"Abe Lincoln! Why, I helped elect him, and a big time we had a-doing it, too. Wigwams for meetings on street corners, and pow-wows, and parades, and newspapers a-going on for him and against him! And before his re-election—he's one of our second-term Presidents, as you may know, Dollie—when he was a-passing through our town by rail, I heard him speak, too, and I'm proud and glad of it to this day. We young fellows—for I was a young fellow in those days—stood among the crowd in the freight-yard when his train came a-slowing in, and he came out on the platform. Well, land alive! You might a-heard us a-shouting a mile or more away and a-clamoring for a speech. One of us rolled a keg o' molasses out from among the big pile o' freight and stood it up on end, and some of us swarmed up the steps o' the train and helped the President down, and then sort o' boosted him up on the keg, and then he begun to talk. What he said went straight to the spot, I can tell you, and he could say an awful lot of just the right sort o' thing in about five minutes, too," Uncle Zach chuckled reminiscently.

"Why, I remember that day," chimed in Aunt Loretta. "I was only about nine or ten, but I remember Lincoln that day so's I could paint him for you. Very thin and very tall, and all rolled up in one of those queer long shawls with fringe on both ends—father used to wear one just like it—and with a high, black, narrow-brimmed hat."

"A shawl!" objected Dollie.

"Yes," explained grandmother; "we surely did wear queer clothes in those days. Women used to have full wide skirts and straight and narrow waists, and hats that ran up into a high peak in front and ended in a 'cape' behind. Little girls went about in summer in low-necked, short-sleeved calico frocks, and in winter they wore long cloth pelisses buttoned down in front. You remember, Loretta, don't you?"

"Indeed I do," laughed her sister-in-law, "and three-button, heelless, black prunella gaiters, while little boys clattered about in thick, heavy leather boots with copper tips to them,—copper-toes we used to call 'em."

"There wa'n't so many newspapers in those days," mused Uncle Zach, "and what we had were smaller far and thinner than our newspapers."

"Yes; and we had to read 'em by the light o' the sitting-room lamp," continued Aunt Loretta, "while in the bedrooms we still used candles."

"And things to eat and to wear going up higher and higher!" exclaimed grandmother. "If I was to tell you what things used to cost before the Civil War, I really think you'd not believe me!"

"And the big, thick, heavy-as-lead copper pennies—and not so very many of them—we used to handle; and the five, ten, and twenty-five cent shin-plasters," said Uncle Zach; "and all the queer coins of their own, issued by big factories; why, even postage stamps were legal tender and could be paid across the counter like money."

"Shall I ever forget," sighed grandmother, "that sad spring morning when my father cried out aloud on seeing his newspaper, and then read to us in a low and shaking voice that Lincoln had been shot! Every house in town went into mourning, with closed shutters and

READY BUILT HOUSES

"Best Built House in This Section."

Continuing C. A. Miller of Ukiah, Cal., writes: "I saved nearly $300 by buying from you. This saving is in the first cost alone." Then as he put up the house himself it meant an additional saving in labor.

The house comes to you 'knock down'—complete in every detail. Plans—simple—explicit. $205 will buy you a home. Machine-sawed material insures a perfect fit. Satisfaction guaranteed. Send for our catalogue today—it's free.

ANTS DOOMED

A Discovery Which Means the End of This Annoying Insect.

If you told the average housewife that there was no need to suffer longer from ants, she would look upon you as an inexperienced dreamer who had never come in contact with the ant pest in a practical way.

However, the fact remains that the ant is doomed. Although hundreds of remedies have failed, one has at last been devised that spells the finish of the ant.

A baker and candy maker in Los Angeles was almost driven out of business by a terrible scourge of ants, which over-ran the entire place. Driven desperate by the annoyance, after much experimenting he devised a simple paste which rid his entire shop of the plague in one day.

So successful did it prove it was was decided to place it upon the market for general use, and a large factory is now required to produce it in the immense quantities necessary.

This little remedy is known as Kellogg's Ant Paste and can be obtained at all modern druggists or grocers. Try it once.

yards and yards of black and white paper muslin."

"Yes, and Brother Sam and me," went on Uncle Zach, "stood in line four hours and a half—the better part o' the night—waiting for our turn to pay our respects to our Martyr-President—laid out in state in the City Hall — with thousands o' men and women before and after us to do the same. Slowly we went in one door, passed slowly by the flag-draped coffin, and then out by another door, every eye wet, and every heart heavy with grief for the man we'd lost. A great, good, wise President if ever there was one!"

"The kindest of husbands," murmured grandmother, "and the most loving of fathers."

"A big-hearted, honest, kindly man," assented Aunt Loretta; "truly 'with malice toward none, with charity to all.' "

"There, Dolly," declared Aunt Kittie, as Hettie came in to clear the table, "there is more than enough material for your composition. Come right upstairs and begin on it."

EDUCATE HOME PURCHASING AGENTS.

What does it cost to outfit a bride or a baby?

What is the way to find a good cook—and to keep her?

Could co-operative housekeeping reduce cost and raise efficiency—and really succeed?

How does buying by mail order really work?

The United States government has discovered that such problems are being investigated scientifically by groups of young women at the University of California. This work has aroused so much interest that in a bulletin on "Education for the Home," by Professor Benjamin R. Andrews, published by the United States Bureau of Education, several pages are devoted to an account of the course on "The Household as an Economic Agent" given by Professor Jessica B. Peixotto of the Department of Economics of the University of California. Here are some of the economic principles expounded in this Berkeley course, according to this government publication:

Not utility only is the basis of economic wants, but sense of beauty, display of power, conformity to tradition.

Household budgets ought to be planned in advance.

Renting or owning homes, living in separate or in group dwellings—these things react on habits of living. Taste, variety, cheer, tradition—these are important considerations as regard food—not nourishment alone.

At some level of income surplus at last appears; what sort of spending really is wise depends upon the amount available for surplus.

As consumer as well as citizen, one has responsibility toward the effort for better wages and better hours of labor.

Thrift on the one hand—love of conspicuous waste on the other—these affect the habits of spending. But in all buying, the factor of psychological return is important, for the principles of buying are largely subjective.

Of the women in the course, fifty per cent filled out household-account tabulation sheets with the complete details of expenditures of actual households. The rest made estimates based on studies of current prices. From comparison, they sought to deduct the facts and the psychology of spending.

All of which is regarded by the university as valuable professional training for the career of most of its women graduates—that of family purchasing agent.

HOW TO GROW TROPICAL FRUITS.

What is a tuna?

A fish, of course.

Yes, but also a fruit. What's more, the tuna is to be given the dignity of being one of the subjects of a new free correspondence course in "Semi-Tropical Fruits" planned by Professor J. E. Coit and just started by the University of California.

Children in California get their hands full of prickles gathering this fruit off the cactus, and usually find the reward scarcely worth the pain. But of late plant-breeders have been developing a number of improved species of the tuna-bearing cactus, with fruit excellent in quality, and moreover free from spines. The Burbank variety is but one of many, others having arisen in nature and having been improved by various experimenters.

Another novel fruit which may in time develop commercial possibilities in California and the art of growing which is to be taught in this course is the mango. A native of India, it is one of the most delicious of tropical fruits. It has now spread through many parts of the world and has been successfully grown in various individual gardens in California.

This correspondence course will deal also with the "Avocado" or alligator pear, which already promises important commercial possibilities for California, with the loquat, the pomegranate, the guava, the persimmon, the cherimoya or custard apple, the carob, and the feijoa, or strawberry guava, a plant native to Uruguay, of which frost-resistant varieties have now been successfully grown in California.

LOGANBERRY JUICE.

[By Prof. C. I. Lewis; Used by Permission of Pacific Horticultural Correspondence School.]

"The simplest way to make Loganberry juice that we have ever tried is the following: Place just enough water in the bottom of a kettle to cover the Loganberries. Heat nearly to the boiling point, but do not allow to boil. Stir them occasionally and crush them if possible. After they become soft strain the mixture through a cloth jelly bag. Allow the mixture to drip thoroughly, putting the juice back on the stove and adding one-third sugar by measure. Again heat the juice up to about 200 degrees and bottle. Drive in the corks tight and cover with paraffin. Such juice can probably be kept indefinitely, as I have kept it at least two years. This is a heavy juice and will need to be greatly diluted before drinking. From one-half inch to an inch of this juice in the bottom of a glass of water is a beverage of sufficient strength. In making punches the addition of the juice of four lemons to each gallon adds to the quality."

When making chicken with dumplings use the fat skimmed from the stewed chicken as shortening for the biscuit. They will be rich, light, and tasty, much better than those made with butter or lard.

For Best Results Use Pearl Oil

Burns oil, the clean, cheap fuel. It roasts, toasts, broils, bakes—better than your kitchen range. No wood, coal or ashes to lug—no soot or dirt—no odor—does not taint the food. And your kitchen is always *cool*. Several sizes and styles. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

STANDARD OIL COMPANY
(California)
San Francisco

The Markets.

Unless otherwise noted, prices are f. o. b. San Francisco.

San Francisco, Aug. 4, 1915.

WHEAT.

Wheat values show no changes locally. There was a temporary stiffening in other markets, due to reports of crop damage, but this is counterbalanced by lack of export buying. The movement here is light.

Cal. Club, ctl.	$1.80	@1.82½
Forty-fold	1.80	@1.85
Northern Bluestem.	1.95	@2.00
Northern Club	1.80	@1.82½
Northern Red	1.75	@1.90

BARLEY.

Demand has been a little more active, both for spot grain and futures, and prices have again been marked up. Some is being sold for shipment as high as $1.30 per ctl., while good bright feed brings $1.25.

Shipping	$1.25	@$1.30
Choice Feed, ctl	1.22½	@ 1.25

OATS.

So far oats have failed to find any strong demand. Offerings are ample, and will be larger before long, and values show little strength.

Red Feed	$1.35	@1.45
White	1.45	@1.50

CORN.

Egyptian corn is practically out of the market, but some kaffir is being sold as quoted. Other grades are moving in a small jobbing way, with values as before.

California Yellow	$1.80	@1.85
Eastern Yellow	1.85	@1.90
Milo Maize	1.75	@1.80
Manchurian	1.40	@1.60
Kaffir	1.80	@1.85

BEANS.

Numerous changes are noted in bean quotations this week, all in a downward direction, and the market appears to be in an easier condition than for some time past. The summer movement has hardly been up to expectations, and local handlers now look for a considerable stock of some descriptions to be carried over into the new season; while the outlook for the new crop so far is good. The trade throughout the country now seems to be pretty well supplied, and business is quiet.

(On Wharf)

Bayos, Cal., per ctl.	$3.50	@3.75
Blackeyes	4.50	@4.75
Cranberry Beans	3.50	@3.75
Horse Beans	2.00	@2.25
Small Whites	3.75	@4.00
Large Whites	3.50	@3.75
Pink	3.00	@3.15
Limas	4.00	@4.15
Red Kidney	4.90	@5.00
Mexican Reds	4.90	@5.00

SEEDS.

Alfalfa seed prices are nominal, as there is no demand at this season, and the old seed is pretty well cleaned up, while no new stock will be offered for some time. Other lines stand as before, with a quiet market.

(Wholesale prices, San Francisco.)

Alfalfa	Nominal	
Brown Mustard, per lb	Nominal	
Canary	10	@12½c
Hemp	3	@ 3½c
Millet	2½	@ 3 c
Timothy	7½	@ 8 c

HAY.

Arrivals continue large, but this has had no weakening effect on the market, as the surplus from previous arrivals has been moved in the export trade, and now the local demand is reviving in good shape. Consuming interests who have long been out of the market, or buying only for immediate needs, are now figuring on their winter requirements, and an active movement is expected for the next few weeks. The better grades, as usual, have the preference, off-grade lots finding little demand here. Old hay is about out of the market, and the buying of the last fort-night has absorbed much of the new crop from growers' hands. Those who still hold are accordingly disposed to ask an advance. Alfalfa arrivals are moderate and find a ready market.

(On track, San Francisco.)

No. 1 Wheat, per ton.	$11.50	@12.00
do No. 2	8.50	@10.00
Barley	8.00	@10.00
Tame Oats	8.00	@11.50
Wild Oats	6.00	@ 8.00
Alfalfa	7.00	@10.00
Stock Hay	5.00	@ 5.50
Straw, per bale	.40	@ .45

FEEDSTUFFS.

Oilcake meal is offered only in a small way, and commands a slight advance, while cocoanut meal is lower. The advance in barley has brought a corresponding rise in the rolled grain. Beet pulp is held at about $20 to $21 per ton, but with alfalfa hay and alfalfa meal at present prices the demand here is negligible.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$20.00	@21.00
Alfalfa Meal, ton	14.00	@15.00
Alfalfa Molasses Meal per ton	18.00	@19.00
Bran, per ton	28.00	@29.50
Oilcake Meal	38.00	@39.00
Cocoanut Cake or Meal	23.00	@25.00
Cracked Corn	41.00	@42.00
Middlings	34.00	@36.00
Rolled Barley	26.00	@27.00
Rolled Oats	33.00	@34.00

VEGETABLES.

The market has been rather flooded with garden truck for the last week, and while arrivals the last day or so have been lighter, values are still low. Tomatoes are now coming in large quantities from the river district, causing the usual midsummer drop, and green peppers, eggplant, cucumbers, and summer squash all show a similar decline. Okra, too, is selling in lugs at low prices. The best green corn also is lower than before, with liberal supplies, though offerings clean up readily. Lima beans are lower, but string beans and peas are fairly steady.

(Wholesale prices, San Francisco.)

String Beans	1	@ 2½c
Lima Beans	2½	@ 3 c
Peas, sack,	1.25	@2.00
Peppers, bell, bx	.35	@50 c
Tomatoes, River, lugs.	25	@35 c
Cucumbers, lug	.35	@50 c
Eggplant, lug	.40	@60 c
Summer Squash, lug	.35	@65 c
Green Corn, sack	.75	@1.25
Okra, lug	.40	@50 c

POTATOES AND ONIONS.

Everything under this head is weak, with large offerings from the Delta section and only limited shipping requirements. Delta potatoes will hardly bring over 85c, while some fancy Valley stock brings as high as $1. Yellow onions are coming in freely, and both red and yellow varieties are cheap. Garlic remains fairly firm.

Delta	.65	@ .85
Onions, yellow, sack	.50	@ .60
Red, sk	.35	@ .50
Garlic, per lb, new	4½	@ 6c

POULTRY.

Business is rather slow, but prices have held steady, and some lines are slightly higher. Good young broilers are in lively demand, selling up to 25c.; and small hens are also doing better than for some time past.

(Wholesale Prices, San Francisco.)

Live Turkeys, lb	15	@17 c
Broilers, 15 lb under	24	@25 c
Fryers	22	@24 c
Hens, extra, per lb	16	@17 c
Small Hens, per lb	14	@15 c
Smooth Young Roosters, per lb	23	@25 c
Squabs, per doz	$2.00	@3.50
Geese, per pair	2.00	@2.50
Ducks, young, lb	13	@14 c
Old	12	@13 c
Belgian Hares	7	@ 8 c

BUTTER.

Butter continues in the same old rut as for two weeks past, without a change in prices, though dealers have been looking for a decline. There has been nothing special in the shipping line lately, and arrivals have been quite heavy.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	27	27	27	27	27	27
Prime Firsts	25½	25½	25½	25½	25½	25½
Extras	26	26	27½	30½	31½	31
Firsts	21½	21½	21	..	..	..
Sel. Pul.	23	23	23	24½	24	24

EGGS.

The first grade is no longer quoted. Extras have taken quite a jump in the last few days, being 5c above the last quotation. Arrivals are keeping up well, but the demand here is stronger than usual at this season.

CHEESE.

Flats and Y.A.'s show no further change, offerings being about equal to current needs. The best lots of Monterey cheese are a little firmer.

(S. F. Dairy Exchange prices on flats and Y.A.'s.)

Y. A.'s, fancy	12½c

DECIDUOUS FRUITS.

With heavy offerings, fruit prices in general have shown a downward tendency, though less stock is coming in the last day or two. Huckleberries are now coming in, selling at 12½c per lb. Strawberries and blackberries are very cheap, and raspberries are easier than last week. Plums are doing a little better, finding a strong demand, while arrivals are lighter. The top price of figs is lower, and peaches in small boxes are quite cheap. Apricots are hardly so plentiful, and good bulk stock brings better figures. Bartlett pears are easier. A slight decline is noted in apples, as offerings are generally increasing. Watermelons are weakening, and cantaloupes show a narrower range. Grapes are dropping. A good many Fountainbleaus are appearing.

Huckleberries, lb	12½c	
Strawberries, chest	1.50	4.50
Raspberries, chest	5.00	@10.00
Blackberries, chest	1.00	@ 2.00

Malaga	.75	@ 1.25
Fontainbleau	.30	@ .50

DRIED FRUITS.

The dried fruit market appears in rather nervous condition, with fluctuations from day to day, especially on apricots and prunes. Very little interest is taken in most other lines. The top quotation named on prunes by local packers is for general offerings: It is admitted that better prices have been paid, up to 3⅝c, for strictly first-class lots, delivered at the packing houses in Santa Clara county. As for apricots, various versions of the situation are given. Some packers state that the crop is below expectations, is getting well cleaned up, and that the market is extremely strong. According to others, the buying is all being done by speculators, in hope of a way being opened to ship to Germany; the more conservative firms holding off from the market. Still others attribute the movement simply to the necessity of filling early orders quickly. It does not appear that any very large quantity has yet been sold above 7c, and it may at least be doubted whether the present top figure will hold. Peaches are still neglected, and pears, etc., are not very important factors in the market. Raisins are moving steadily, with a fair export demand as well as the usual eastern business. The New York Journal of Commerce says:

"An order for 3,000 boxes of prunes for immediate delivery to Europe was filled July 29.

"This new order, which comes from an English source which heretofore has not been in the market here for supplies, is taken as an indication that the foreign trade has found an increased demand for prunes and have turned here for stocks to fill their immediate demands.

"Buying in the spot market by local jobbers is slackening. This is said to be only a normal reaction to expect at this time of the year. The prunes are being kept in cold storage and cannot be taken out until absolutely necessary for demand. Consequently, the purchasing has assumed a hand-to-mouth aspect, and this, together with the scarcity of available supplies, has had the tendency to cut down the volume of business which is being done.

"It is reported in the market that there has been a fairly heavy quantity of seeded raisins of old crop within the past few days for immediate exportation to Europe. There has been some movement in this direction in small lots all summer, but the present purchase, from rumors which are prevalent, is one of the largest made. Cleaned Sultanas and Thompson seedless 1914 pack are practically cleaned up in the spot market. The inclination here is very strong and a steady demand is maintaining prices on a very firm basis.

"Advices received from the Coast report that there is a firmer tendency on future apricots."

(Prices to Growers.)

1915 crop.

Apricots, per lb	7	@8 c
Figs, white	3¼	@3½c

Apricots, per lb	7	@8 c
Prunes, subject to dist.	3½	@3⅝c
Peaches	3	c
Pears	5	@6½c

CITRUS FRUITS.

The eastern auctions sl. / increasing prices for Valencia oranges and a little gain for lemons. Shipments of lemons from California are increasing and all growers are hoping to clean up the large stock in storage during the warm weather period. At New York on Monday, August 2d, Valencias brought from $3.45 to $5 per box average, and lemons sold for $3 up to $3.35 average. Other auction points paid about the same as New York for California fruit.

Oranges receive comparatively little attention in the San Francisco market, and the top price is a little lower than for several weeks past. Grapefruit is higher, with an active demand in the local trade.

(Wholesale Prices, San Francisco.)

Oranges, Valencias, bx.	$2.75	@3.25
Grapefruit, seedless, bx.	2.50	@3.00
Fancy	3.00	@3.50
Lemons, box	1.50	@3.50

NUTS.

There is little new in the nut market, as the new Association prices have not yet appeared. The almond Exchange is awaiting further advices from Europe, as the situation there will have an important bearing on values here. Some buyers are trying to pick up odd lots of almonds in the country, recent offers having been made of 13 to 15½c for Nonpareils.

(Prices f. o. b. San Francisco.)

Almonds, 1915 crop:		
Nonpareil	15½c	
IXL	14½c

HORSES.

Large war purchases are still reported from various parts of the country, the largest being a lot of mules taken from Stanislaus county. Notwithstanding this, the price of mules is said to be comparatively low in the country; and the local horse market is without animation. Very little stock is being shipped to this market at present, and it is hoped that, with the fall revival of business, there will be more demand.

(Approximate values at San Francisco, based on auction sales.)

Heavy drafters, 1700 lbs. and up	$275	@	300
Light drafters, 1550 to 1650 lbs	175	@	200
Chunks 1350 to 1500 lbs.	150	@	175

HOPS.

Prices have taken another jump, and buying continues very active. There is a strong export demand, and it is said that most of the new crop in this state has been sold.

1915 crop, lb	13	@	14c

SPECIAL DECIDUOUS MARKET REPORTS.

By J. L. Nagle.

The Atlantic seaboard markets this past week have shown the effects of increased shipments both from Eastern states and from California and though the receipts of pears were confined practically to California, there has been such a heavy shipment of fruits and berries from all districts that the Bartlett pear market depressed sympathetically.

The California Elberta movement is now at its height. The San Joaquin Valley has been shipping for ten days and Placer county districts will move an immense crop this week. The quality of the fruit is excellent and of good size, and although the demand is not very active on account of Arkansas and Northern Georgia having a very heavy shipment which is now moving, we look for a little flurry in the Middle West, due to the fact that Texas has practically finished shipping, but we do not look for any re-organization of conditions until after the 10th or 15th of this month.

The Standardization Law of California, regulating the weight and pack of fruits for interstate shipment, and also regulating the sugar content of grapes, will go into effect on the 8th of this month. Grapes not testing 17 per cent cannot be shipped from the State. Growers in the Fresno district are trying to get as much of their fruit East as possible before the law goes into effect and as there seems to be an active demand for Malagas they have been considerably encouraged, but unless the grapes test somewhere near 17 per cent we look for some low sales.

The severe hot weather which lasted three or four days during the past week seriously affected the Tokays in the upper San Joaquin valley. The crop will not exceed 65 per cent.

There still seems to be an active demand for Blue plums and we look for this condition to remain normal until Idaho commences shipping Italians in about two weeks.

The following prices have ruled for the week:

New York—Bartlett Pears averaged $1.80; Seckel Pears, $1.25; Burbank Plums, 89c; Wickson, 88c; Gavioto, $1.15; Hinori, $1.40; German, $1.34; Tragedy, $1.25; Kelsey, $1.10; Diamond, $1.50; Quackenboss, $1.70; Malaga Grapes, $1.42; Thompson Seedless, $1.20; St. John Peaches, 60c; Elberta, 62c; Crawford, 50c.

Chicago — Bartlett Pears, $1,60; Crawford Peaches, 52c; St. John, 48c; Diamond Plums, $1.66; Tragedy, $1.51; Burbank, 92c; Wickson, 99c; Satsuma, 84c; Duane, 76c; German, $1.64; Malaga Grapes, $1.70.

Minneapolis — Crawford Peaches, 52c; Foster, 53c; St. John, 53c; Bartlett Pears, $1.65; Malaga Grapes, $1.77; Burbank Plums, $1.00; Wickson, $1.15; Climax, $1.10; Tragedy, $1.85; Diamond, $1.37.

Total shipments to date, 4414; total shipments same date 1914, 5630¼.

Publisher's Dep't.

Beginning with this issue the Rural Press will print a series of articles covering the dairy situation in California, that we believe will be well worth the attention of every dairy, creamery and commission man or distributor. Events have so shaped themselves that "opportunity" is now standing at the doors of the dairy industry. This journal wishes to be of service in the matter and believes that it is doing only its duty in presenting the facts at this time as we find them. Read our first page article this week and succeeding ones during the weeks to follow.

John Vallance, president of the Pacific Coast Nurserymen's Association, was a caller this week to tell us of the arrangements being made for the annual meetings of the Coast as well as the California Nurserymen's Association at San Francisco next week. These meetings are of great practical value to nurserymen and from what Mr. Vallance told us, the members may expect not only a good attendance but fine entertainment and a program that will mean great things for the future.

The Pacific Rural Press expects shortly to publish a new and much needed book on California Swine Breeding. The copy is all ready and only awaits the final O.K. from several practical hog men before going to the printers. We anticipate having the book ready for delivery some time in September. The price will be $2 per copy, postpaid. Advance orders accepted and filled in rotation.

A splendid work has been taken up by the University of Nevada, which will prove of invaluable service to ranchers and prospective irrigators in all parts of the State. A department has been organized to develop and test our water wells in different localities and to assist ranchers in producing water in the cheapest and most efficient manner. This work will be under the direction of Dean Schrugam and water developing engineers have heralded this new movement as one of the most helpful and practical services the Nevada University could perform. The data and first hand knowledge of water conditions will be at the disposal of all those interested in water development. The University has just ordered two new centrifugal turbine pumps to be used in its work. The pumps were manufactured by the Layne & Bowler Corporation of Los Angeles. It is stated that many of this type are in successful operation in all parts of Nevada and the University has selected it as the best suited for its research work.

PRUNE GROWERS IMPRESS EAST.

Following is an extract from the New York Journal of Commerce: Its age by the time of reprinting does not invalidate it:

"It is said that the prune grower is becoming more and more convinced that he will be in a position to enforce his demands for a higher selling quotation from the packer. With this end in view, he is stubbornly holding on to his fruits in anticipation that more money will accrue to him if he keeps control of his crop until September. At present he is firmly refusing to consider the lower price which the packer feels inclined to pay.

The Packers' Hope.—"As the drying season comes on, it is thought that the grower will find himself under the press for ready money; and with his stocks of fruit ready for the market accumulating and the packer tempting him with a fair price for his product, it is expected that he will be ready to sell and retreat from the stand which he is assuming at the present time.

"European inquiry still comes to brokers here, asking for terms and available supplies. It is said that shipments have been made for foreign consignments for several weeks, and more are expected to be made as soon as additional stocks arrive from the coast."

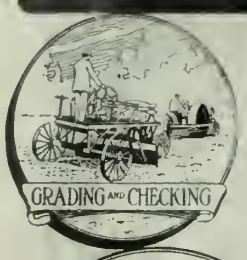
GROUND PHOSPHATE IN FEEDING SHED.

To the Editor: We use a feeding shed which is littered each day with straw to absorb and collect the excretions of cattle. If a quantity of raw rock phosphate were scattered over this manure once each week would any of the fertilizing qualities be liberated before the manure would be spread and plowed under? We "clean up" every three months. —H. I. B., Fallon, Nevada.

[The phosphate rock if finely ground would act as a good absorbent and would not set free fertilizing gases as lime and ashes do.—Editors.]

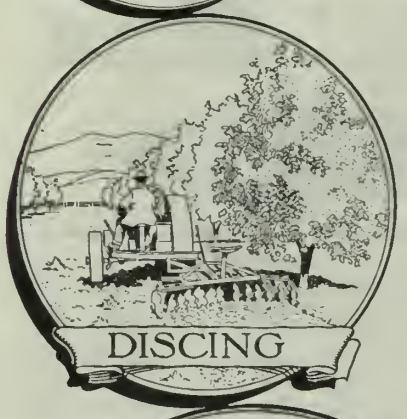
Two carloads of horses were shipped from Merced on July 21 to Omaha, Neb., for use by the French and English armies.

California Almond Growers' Exchange



The Exchange has withstood every storm, met every obligation, and has held fast to those teachings which stand on truthfulness, honesty, equity and square dealing in business. In five years it has grown from a membership of 230 growers to 900—a record which stands as a silent testimonial to the efficiency of the Association.

MAIN OFFICE, 311 CALIFORNIA STREET,



San Francisco, California.

"Big Bull"

A POWERFUL COMBINATION

TRACTOR AND PORTABLE ENGINE

Before you consider buying an **ORDINARY** gasoline engine, find out what **BIG BULL** can do on your farm. Here is a strong, efficient, many-purpose power plant that not only does all your plowing, discing, and seeding, but runs manure spreaders, draws heavily loaded wagons, pulls hay leaders, mowers, binders, runs corn shellers, feed grinders, small shredders, threshers, and ensilage cutters. Practically no limit to the **BIG BULL**'s capacity. Hitch it up to **ANY** machinery you now own. Don't buy any new equipment. Big Bull will drill wells, pump water, saw wood—anything small or great about the farm where **CHEAP** power is demanded!

One man and Big Bull easily do the work of several horses and hired hands. Big Bull does all your traction work—does it faster, better and **MUCH** cheaper than horses can possibly do it. The time alone gained by using Big Bull to cut their grain saved Lovegreen Bros., Ada & Linn, last year the price of their machine in **JUST ONE HARVEST**! Thousands of other old-time farmers are adding new profits, eliminating the unnecessary costs of horse-drawn farm implements and raising the value of their acres by keeping them in perfect crop condition!

Costs less than a Stationary Engine of Equal Efficiency

$585 F. O. B. Minneapolis, Minn.

BIG BULL is out of the experimental class. Thousands of Big Bulls now used. Severest tests in all kinds of soils prove just one thing:—That Big Bull is the perfected, the proven, the best light tractor for **GENERAL FARM USE**!

You can't duplicate our tractor service anywhere on the Pacific Coast! We offer you a **PROVEN** all-purpose tractor and portable engine at the record breaking price of $585—we carry every part of Big Bull right here in stock all the time—we can give you valuable special information about how Big Bull will best work in your particular type of soil.

THOUSANDS NOW IN USE. A BIG, PROVEN MONEY MAKER FOR 2 YEARS. COMPLETE PARTS KEPT IN ALL OUR PACIFIC COAST BRANCHES.

If you'll only **LEARN** how Big Bull works, and how much more profitably you can handle every crop, you will certainly want a Big Bull. Note these few big points:—The bullwheel runs **IN THE FURROW**, and this means crop increase.. This one exclusive feature is the most sensational tractor improvement ever devised. It makes Big Bull a deep-tilling machine, a tractor that **DOES NOT** pack the soil. Grousers on the bullwheel penetrate into the ground 4 inches deeper than the plowshare cuts, and tear and loosen the soil as thoroughly as the plow could. Hard subsoil, even hardpan, is completely penetrated and made ready for irrigation.

Aspects of the Olive Industry.

The olive has arrived at economic problems, which also confront other fruits. The writer undertakes to state them and the efforts now being made for their solution.

[Written for Pacific Rural Press by Henry Wolff.]

EVERY industry undergoes a critical period which clearly defines the change from its infancy to its normal development. In California industries this period, or era, generally separates the "boom" stage from the conservative commercial stage. At the present time we have the ripe olive industry changing from a "game," the profits of which are widely heralded by the real estate salesman and promoter, to a legitimate enterprise in the growing, manufacturing and distributing of an article of food which may become one of the leading agricultural pursuits of the State.

That the ripe olive, properly prepared, is an article of merit is uncontradicted. That an olive pickled partially ripe, over-ripe, or poorly processed, is an unsalable product, at least the second time, can be confirmed by packers throughout the State and buyers throughout the United States.

The above facts being true, the problem presenting itself to olive men is to produce a ripe olive of good quality at a profitable price, and to distribute this article to the consumer in a package, the keeping properties of which are certain.

OLIVE PLANTATION ON HILLSIDE NEAR OROVILLE.

The picture gives a good idea of the hillside olive country near Oroville. Above is the crest of "Table Mountain"; next the olive orchard with uncleared land from which it was developed and below the picturesque Feather River.

Although the ripe olive was considered a hopeful article many years ago in California, and then largely abandoned because of difficulties in manufacture, the present phase of the industry has been one of very rapid growth. The high retail price received by the Ehmann Olive Company for their product induced others, who were attracted by the apparent high profits, to enter the field. The fact was lost sight of, however, that the percentage of an olive crop fit to make a ripe olive pickle (especially one which is fit to put up in glass) is a very small one.

A second item often unconsidered is the immense amount of close personal attention required in order to secure a uniform result in curing. Olive pickling, unlike other fruit-packing branches, is carried on under conditions which are not always uniform, e. g., temperature, condition of fruit, locality where fruit is grown, not always being controllable, etc. Therefore, there is bound to be large wastage in the manufacturing.

Unmindful of the above, many individuals and concerns went into the ripe olive business. Large prices were offered for crops, often at unprofitable prices to the packer, in order to "break into the game," and contracts entered into where fruit was bought up for several years regardless of its condition or size. The large returns received by the growers caused great plantings of olive trees and better care of those groves already bearing. At the present time, although the bearing acreage in California is not much greater than it was four years ago, the tonnage of olives is nearly double, owing to better care in irrigating, cultivating and fertilizing.

And so we come to the conditions of today: A large crop is maturing on the trees. Jobbers and retailers are heavily stocked with ripe olives, mostly of the smaller sizes. A large stock, also, of the smaller sizes, and poorer qualities, is still in the hands of the packers, and the financial condition of the country not warranting luxuries, and ripe olives being sold as such, their sale is slow. Fruit costing the packers from $125.00 to $160.00 per ton is being sold below cost in order to realize some money to hasten their movement. The consuming power of the East is great, but the ripe olive is not well known and the distribution of the product is restricted. And still the large crop keeps on maturing.

It is now reported that many growers unable to sell their fruit at what they have deemed remunerative prices have entered the field of packers. Not having the capital or knowledge of processing, we have an additional supply of fruit, poorly packed, thrown on the market at prices which are way below the actual selling price of the fruit on the trees.

A few figures taken from olive packers and growers throughout the State may prove enlightening. The figures, we believe, typify actual conditions.

Pickling Olives.—A ton of olives will produce three hundred and sixty gallons of pickled fruit, provided there is no wastage. However, not every olive picked is suitable for good quality pickles, for a percentage is always bruised in picking, transporting and curing. If an average of $1.00 per gallon, which is liberal, is received for every gallon of pickled ripe olives, we have a gross income of $360.00 per ton to the packer. Taking—

$125.00 as a cost of fruit on the trees,
15.00 as a cost of picking,
4.00 as a cost of hauling,
25.20 as a cost of cans, at 7c each (360 gal. cans),
100.00 as a cost of curing, materials, labor of sorting, cost of canning, labels, etc.,

we have a total of $269.20, which allows $90.80 as the difference be-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau, at San Francisco, for the week ending at 5 p. m., August 10, 1915.

STATIONS	Past Week	Seasonal To Date	Normal To Date	Max'm Temperature	Min'm Data
		Rainfall Data			
Eureka	0	.26	.12	64	50
Red Bluff	0	0	0	100	60
Sacramento	0	0	0	96	56
San Francisco	0	.01	.01	72	50
San Jose	0	0	0	86	46
Fresno	0	0	0	102	60
Independence	0	.04	0	96	58
San Luis Obispo	0	.01	.03	88	50
Los Angeles	0	0	0	90	58
San Diego	0	0	0	76	62

THE WEEK

Next week the Gravenstein Apple Show will be on at Sebastopol and it should be the best event of a most unique and influential series. We have always admired the youthful vigor and enterprise with which "Old Sonoma" has demonstrated that there is no senility in its blood. Sonoma was one of the first California counties to respond to the touch of development before and after the invasion by the gold-seekers, and was disposed to take a nap while the spirit of enterprise was awakening in parts of the State more distant from the metropolis. During more recent years Sonoma has been wide-awake and anxious to show that it is not really distance from San Francisco which should lend enchantment to the view. This disposition has been most marked in the rich and delightful small valleys on the west side of the county, and the exponent of its spirit has been the series of Gravenstein festivals at Sebastopol. The region is unique in the excellence of this early apple which it produces and in the use made of the distinctive product in industrial development. California apple production may have bounds set upon its profitable extension by the achievements of other winter-apple States, but in the early maturity of fine fall apples it can have no rival. As soon as Sebastopol really went to work to handle an early apple with the push and enterprise which was hitherto reserved for the long-keeping winter varieties, it won success and recognition because it had zealously entered upon a very excellent and distinctive California undertaking —that of wide shipment of early apples before any other State could ripen them, and it fortunately specialized upon the early apple of greatest beauty and highest quality, which in some parts of the State is as illusive in bearing as it is good when secured. Thus Sebastopol did just the thing to which nature and enterprise gave her good title, and the annual displays which are made are among the unique and characteristic things which California can show in fruit-growing. We hope Sebastopol will gather a great multitude next week—even if it depopulates the Panama-Pacific!

Man Breeding.

From the fact that we did, in these columns of the issue of July 24, insist on grouping babies, calves and pigs in joint possession of the same principles of early physical development, we apprehend that we may be thrown in with the apostles of "race-betterment," who had an exposition-congress last week and filled the daily journals with their recipes for breeding better men and women along the lines approved in the experience of those who have accomplished most in the improvement of plants and domestic animals. Conscientiously we must object to such affiliation, and we do it with some sacrifice of the delights of personal vanity, because this writer has exactly the stature and weight decided upon by the race betterminters as the ideal of perfect manhood, and possibly they might allow us to walk among them as a god—therefore, no claim of "sour grapes" can be urged against our declination of their adulation. However, even at such great sacrifice of personal vanity, we are compelled to decline their point of view and to doubt the practicability of their methods and the desirability of them, even if demonstrated to be practicable. For, if their contentions lead to anything, their influence must be toward the selection of human ancestors according to standards of physical weight and measure and the establishment of a registry of these characters in detail, from which it is advised that life-partners be selected by men and women having designs on posterity. Although more regard for good physical characters is surely desirable, and the present agitation may call wholesome attention to it, we must protest the inadequacy of the standard because it omits the best things in humanity—the things which differentiate humanity from plants and from the lower animals. We do not argue this point; it is up to the preachers and other idealistic philosophers.

The Waywardness of Man.

The inadequacy of a basis, largely or wholly physical for movements toward ancestry, may be thus summarily abandoned, because in practice, the youth of both sexes could not give even the slightest regard to it. It does not include the tastes and emotions, which are the moving forces in human action. No matter how clearly the formula for a race-betterment partner might be fixed in the head of a man or a woman, it would not take much of a bump of the heart to blur it into the exact measurements of the actual charmer in whom the senses reveled. There has been race-betterment effort all down the ages, probably. Formerly it was as complete and autocratic as the present reformers could desire. The parents settled it and the kids made the best of it. As personal freedom and responsibility arose in the minds of man, this tyranny of parents was repudiated, and such tyranny has had to be content with playing the villain in dramas and novels ever since. In real life it now only exists in the tears of doting mammas, the scolding of maiden aunts and the occasional disinheritance by angry fathers. The most conspicuous character of such tyranny at the present time is its impotence. The young people do not care a whoop for it. Romeos climb conductor pipes and Juliets slide down knotted-sheets, and it looks as though they would continue to do so to the end of time. And we are not sure but it is much better for the race that way than any arrangement by physical formula could possibly be. It is often the birth of adventure, of resolution, of enterprise in the human heart. Its products are often independence, intrepidity, self-sacrificing companionship among those who might otherwise have never been awakened from the absence of these qualities. But we are not arguing for it; it is sometimes most regrettable in its consequences: we are simply taking it for a fact in the lives of human beings and deploring efforts at prescription, which take no account of the boldness and heroism of it, on the whole. And it is a fact which cannot be annihilated. In spite of all authorities, the young giant will still choose the sylph, whom he can hold aloft on his extended palm, and the young giantess will still enfold in her ample bosom the little shrimp who captures her affections. And we have always, most scientifically, believed that this was good for the average and general advancement of the race through the banishment of both giants and pigmies from the earth. This old natural method of selection has worked by playing extremes against each other and continually raising the average. The new scientific method of measurement and registry and establishment of an ideal standard, aims to play both ends against the center, and we are not at all sure that it is so good a game.

The Burbankism of It.

Naturally our race-betterment reformers try to get something concrete to put in the foundation of their propaganda, and so they call upon Mr. Burbank to pour his experience into the trenches they have dug. According to a reporter's notes, he said this: "It is becoming increasingly necessary to impress the fact that there are two distinct lines in the improvement of any race; one by favorable environment, which brings individuals up to their best possibilities; the other (ten thousand times more important and effective), selection of the best individuals through a series of generations. By this means and by this only, can any race of plants, animals or man be permanently or radically improved. When these two lines of action are combined, all the best qualities of any type are brought forth and fixed—and the field for improvement is limitless."

This is a perfectly rational and practicable scheme of improvement in the reproduction of organisms which are under control of man. If mankind were under the control of man its improvement would also work—providing the standards of selection were the right ones, but man has never gained control of mankind as he has of plants and the lower animals, and, in the nature of the case, he never can. Laws and customs have prohibited commingling of races and classes with more or less success, but, outside of royalty, no individual prescriptions of partnership have been made except in bondage or in patriarchal practice, and that, as suggested above, is abhorrent to modern conception of individual rights. Therefore, the art of the plant and animal breeder does not apply to the breeding of mankind, for the enforcement of it would be a resurrection of slavery—an institution which has always tended to the debasement of a race and never toward

its improvement. But, it may be said, race-betterment congresses do not contemplate control, but only suggestions to influence individual selection. To that we have to say that undue emphasis upon physical standards may endanger considerations of greater moment. Any associated effort for marriage which obscures the light of true love, with its essential qualities of loyalty, devotion, self-denial, incentive to industry, etc., and exalts the scale and tape line as equivalent thereof, or as superior thereto, substitutes the transient for the enduring and robs mankind of its most godlike element.

An Important By-Product.

Though we seriously doubt both the wisdom and the practicability of the race-betterment movement in its aims at man-breeding, and are disposed to deny the analogy claimed on the rich experience of Mr. Burbank, we welcome the publicity given to such experience in the breeding of plants and animals. The wider public knowledge of such experience, and the discussion of it, will tend irresistibly to the wider use of it in its proper sphere. It is even possible that the striking announcement of physical defects in man, which adherents of the new doctrine are making, will arouse breeders of organisms which have, except in most elementary form, neither will, nor emotion, nor moral sense, to make much better use of the plastic forms of life upon which their industries rest. They will, of course, be influenced by the emphasis which is placed upon physical selection, and they will appreciate more fully that selection requires something good to select from. If they will read the addresses and discussions at the race-betterment congress, which we doubt not the society will soon publish for the widest circulation, they will find them so strong a demonstration for live-stock and plant improvement that they can no longer fail to give heed to such improvement in their farming operations. Though we are inclined to doubt whether the current race-betterment effort will do much for the human race, because it cannot reach to the deepest things in human life, we are quite sure it will knock out many a poor plant and scrub animal from the reproduction of its kind. It may not give us better men, but it will surely raise the standard in bucks, bulls and stallions.

Let the Monkey Do It.

Strikingly suggestive, in view of the onrush of the race-bettermenters, comes the claim that California ought to have an experimental monkey ranch. If the plan of Professor Robert H. Yerkes, eminent scientist and member of the zoology department at Harvard, is carried out, a big monkey farm for experimental purposes and for biological study will be established in Southern California. Prof. Yerkes announced his plan last week at one of the sessions of the Association for the Advancement of Science, and declared California to be his choice of location for monkey-study in preference to Borneo, Jamaica, Porto Rico and other tropical regions. Of course, demonstration with monkeys would not disprove the radical objections we have made to the whole scheme, and yet the reformers might think they were getting a little nearer to the real thing, for Prof. Yerkes says: "Surely it is high time to make provision for the thorough biological study of those organisms which are most similar to man and from whom, therefore, experimental pathology, genetics, psychology and the social sciences and technologies may be expected to obtain information of immeasurable theoretical and practical value." He also says: "It is proposed to study the instincts, ideational behavior, and social relations of the anthropoids." These profound issues, so far as we are able to understand the names of them, seem to resemble very closely the targets which the betterments are setting up and in the present situation the suggestion of Prof. Yerkes must be what is sometimes called "almost providential." God save the human race!

Queries and Replies.

Querists must give name and address.

Fruit Trees After Vines.

To the Editor: I have heard that it is very difficult to establish a good orchard on a piece of ground which has been used as a vineyard. Is this true? If it is true can you tell me why?—A Constant Reader, S. F.

Why, yes, in a way—but not necessarily nor always. Good orchards are now standing on lands formerly occupied by grape vines, and some of them have been brought along for a time without removing all the vines. It depends upon the soil and how reasonably and diligently the work has been undertaken. If the soil is shallow the vines may have reduced it to poverty in plant food. If the soil is disposed to run together, the prolonged shallow culture of the vines and lack of humus may have made it hard and rebellious in tillage. In either of such cases it is hard to get trees into good growth immediately after removing vines. There should be an interval of manuring, deep plowing and thorough, deep harrowing for field crops before the trees are planted; and grain, followed by potatoes, beans, or beets, is particularly good. A run of the land with alfalfa is best of all to revive and mellow it. But on deep loams, though such rotation is also desirable, good trees can be grown right after vines with good tillage and adequate moisture, either from rainfall or irrigation.

Harrow or Disk on Alfalfa?

To the Editor: Which is the best to use in stirring or loosening the ground on alfalfa, a spring tooth harrow, or a spike-tooth disk?—E. L., Winton.

It depends upon the soil, the age of the stand and what you are worrying the alfalfa for. Each grower is likely to answer it according to his conditions, and therefore all types of alfalfa-agitators are well spoken of. If that is to loosen up the soil crust, the full disk set pretty straight and the spike forms of revolvers will all do it—the spikes usually giving most trouble in clogging by winding rubbish. If the alfalfa is well rooted, full disks and spring tooths do not usually injure the crowns, and are widely used. If the alfalfa is to be cleaned from grass, etc., the spring-tooth works well. On the whole there is probably no best tool for the purpose, just as there is no best plow, or incubator, or agricultural editor. Keep trying them until you get the one that suits you.

Profitable Age of Apricots and Cherries.

To the Editor: What is the probable bearing quality of apricot trees 16 to 18 years old? The trees are large and healthy and have been fairly well cared for. The orchard is in Santa Clara Valley, west of San Jose. Are such trees too old to be profitable? If still serviceable, what kind of treatment should be given them to get the most out of them. There are also cherry trees of the same age. Have they passed their usefulness?—Enquirer, Berkeley.

Such trees as you describe must be counted in their prime. On soil of good depth and drainage and well cultivated they may be expected to bear profitably for fifteen years more—and, if everything goes well, perhaps much longer. Under such conditions both apricots and cherries are long-lived trees. They will need intelligent pruning to remove inferior and weakening wood and encourage newer and more thrifty growth. Fertilization is likely to be required and adequate moisture is essential, either by rainfall or irrigation. Old trees usually disclose weakness by dying back of branches from the top and this can be prevented by pruning, fertilizing and irrigating, when necessary—providing the soil has depth and drainage which favor long life and vigor in the root.

Red-Humped Caterpillar.

To the Editor: I have 40 acres young orchard, and find these worms which I send scattered here and there. So far I have only found them on walnut and prune trees. When they start on a tree, sometimes they strip it clean of leaves and other times take one branch. What are they, and what is the remedy?—W. S., Elk Grove.

The insect is the "red-humped" caterpillar—so called from the spiny protuberance just back of his neck, so to speak. He is an old enemy, having been known from pioneer times, but is not often abundant. As the worms go to the ground about this time of the year, and spin near the surface, they are probably largely killed by subsequent cultivation. When they appear only here and there on small trees, hunting and finger-crushing is the cheapest treatment. When abundant they can be poisoned with arsenical sprays. As they have fierce appetites they should not be allowed to get much headway.

The Jujube.

To the Editor: I am sending you some branches with fruit and leaves. What kind of fruit is it, and is it good to eat or for preserving, etc.?—A. R. P., Garrison, Texas.

The plant is the jujube (Zizyphus jujuba). It has been slightly grown in California for the last forty years or more as a low ornamental shrub with white flowers. The fruit is edible and its juice is used to some extent by confectioners in making a translucent elastic paste. The plant thrives in California, both along the southern coast and in the hottest interior situations, where it is grown by irrigation. It fruits profusely, but little use is made of the fruit. The jujube is chiefly grown and used in China; the fruits dry readily and seem to please the Asiatic taste, for they are found in the Chinese provision stores as imported from China.

Spider Nests on Potatoes.

To the Editor: Enclosed find a potato peel which is affected with a scale of some kind. What is its name and does it do much damage? The sack full we bought is not badly affected. —G. C., Ellsworth.

The brownish flat, scale-like bodies, about a quarter of an inch in diameter, are the remaining receptacles of spider eggs which have flattened down after the young hatched out and went about their business. The adult spiders evidently found the potato collection a snug harbor and used it for reproductive purposes. They of course have no appetite for potatoes and are not a pest thereof.

Little Change in Crop Prospects.

[Written for Pacific Rural Press.]

The most marked crop change since our last report is about the Tokay region, where hot weather seems to have seriously damaged the crop while mildew has been very active. The Fresno raisin crop is full, but the table grapes about ¾; Alameda, Tehama, Glenn, and Merced report 4-5 crops. The estimate has dropped 25 points in Lake county and 5 in Yuba for the seedless, while Yolo is reported as a full crop.

Alameda almonds reported 45 per cent last month, are 80 this; Glenn estimates by the farm adviser are 25 per cent lower than the last report. Los Angeles is up 25 points, Yuba down 5, the rest of the reports show no change.

Apples in the main are unchanged, though slightly reduced in San Bernardino, Inyo, Eldorado, and Glenn counties. Placer county apples are all harvested.

Apricot reports show reduction from last month and are largely off the trees. The crop was light owing to unfavorable spring weather and brown rot on the ripening fruit.

Olive prospects are reduced in Tehama, Monterey, and San Bernardino counties.

Figs and grapefruit show no appreciable change. While Los Angeles reports a full crop of lemons, Ventura and Fresno lower their estimates 15 and 20 per cent. Los Angeles oranges are given as 90 per cent while Fresno, Kern, and Riverside have lowered their figures by 10 per cent.

Yuba peaches look 10 per cent better than last month, Eldorado and Merced 5 per cent better; Tehama, 5 per cent lower, Yolo and Glenn 20 per cent down, and Humboldt 25 per cent down. Placer's extra heavy crop of shipping peaches are about half moved.

Pear prospects have improved in most parts of the state, with Sonoma reporting a 25 per cent loss from last month. Placer's full crop is ⅔ moved to the East.

Plums show slight variations up or down in the various counties, Los Angeles having lost 20 per cent.

Prune prospects are but little changed, though the lighter-producing districts show improvement with a report from Russian River of propping the trees for the big prunes. Cracking has spoiled a great many in various sections. Sacramento valley has lost about 10 points for various reasons.

Walnuts still show no material reduction in the heavy producing districts.

Penryn, Placer county, reports the biggest crop of all kinds ever produced in that section. Merced sweet potatoes were reduced to 75 per cent by lack of irrigation due to a broken ditch and low water in the eastern rivers. Alfalfa yield in Yolo is reported below normal due to excessive early rains. Santa Barbara ranchers are planting carobs for stock feed. Yuba rice on 2600 acres is in excellent condition, and the horticultural commissioner is encouraging the planting of mulberry trees to anticipate a silkworm boom.

THE Chevalier barley business in California is on the down grade. About 20 years ago California produced, in round numbers, 12,000,000 to 15,000,000 bushels of barley, of which about 20 per cent was Chevalier. Last year California produced about 40,000,000 bushels of barley, of which only 1 per cent was Chevalier. During the current year, California is expected to produce about 24,000,000 bushels of barley, of which about 350,000 bushels will be Chevalier, and the balance 6-rowed barley.

At the time that 20 per cent of the California barley crop was Chevalier, the market for the same was particularly in England, but England greatly prefers the 6-rowed barleys, and for the last few years no Chevalier whatever has gone to England.

At the time that California produced large quantities of Chevalier, the difference in price between Chevalier and 6-rowed was very slight; the advantage being in favor of the Chevalier. That advantage ordinarily abounted to about 5c per bushel, but it was a hazardous crop, as sometimes when the brewers did not want Chevalier and it had to be used for feed it would not fetch as much for feed as the 6-rowed barley, consequently the growers cut down the production, especially as it is a harder crop to raise than the 6-rowed.

In the last few years, since Chevalier has become scarce, the difference in Chevalier has gone very high, and at the present time, during the end of the 1914 season, the difference is as high as 30c per bushel, and yet this 30c per bushel preference of the 1914 season has not influenced any growers to increase their production of Chevalier; in fact, the production is smaller because, on the general run, the 30c difference is not a reliable difference as the growers cannot count upon there being a substantial difference in any future season in favor of the 2-rowed barley.—Letter of H. E. Clemens Horst of S. F. to Robert Wahl, Chicago.

Washing Increases Decay in Oranges.

But the injury is reduced to small amount by careful handling, and heated air is effective and cheap.

During the past two or three years there has been a great increase in the washing of oranges in the packing houses of Southern California, and the indication are that a much larger proportion of the fruit will be submitted to this treatment in the future unless effective measures can be used for the control of scale and sooty mold in the orchards.

The results of the investigations of the Bureau of Plant Industry have shown that washing, even under the most favorable conditions, is followed by an increase in the decay in the packed fruit.

During the orange-shipping season of 1914-15, an investigation was conducted by the Bureau to determine the relation of handling to the occurrence of decay resulting from the methods used in the washing and subsequent drying of the fruit. The work was undertaken at the request of the Citrus Protective League and packing-house experiments were made in ten different houses during the season.

Orange Washing and Drying Experiments.—The handling experiments were planned to make a direct comparison of fruit very carefully picked by the bureau men with the same kind of fruit handled under ordinary commercial conditions. The fruit was packed and held in the packing houses and the percentages of decay in the various lots were determined by inspection at the end of two weeks. The different lots included carefully handled and commercially handled fruit washed in the ordinary machinery, part of which was packed while still moist or wet and an equal amount of fruit which was thoroughly dried before packing. Part of the same fruit was packed without washing or brushing. These experiments were designed to show the effect of the washing process on the keeping quality of the fruit and to furnish data indicating the percentages of the decay due to the wet or moist condition of the fruit at the time of packing.

The results of these tests show that the percentages of decay in carefully handled fruit were increased from 1.8 per cent in the unwashed fruit to 3.4 per cent in the washed and thoroughly dried fruit, and was increased to 3.9 per cent in washed fruit packed wet. In the ordinary commercially handled lots the average percentage of decay in the unwashed fruit was 8.3 per cent. Washing followed by thorough drying increased the decay to 11.4 per cent, and in the same fruit packed wet the average decay was 13.9 per cent. The difference in the percentages of decay developing in the wet and dry-packed fruit was considerably greater during the period of cloudy or wet weather early in the season. The figures given are the averages for the whole season.

Relation of Handling to Decay in Washed Fruit.—The results indicate that the losses from decay resulting from packing improperly dried oranges are directly in proportion to the care exercised in the methods of handling. Fruit showing a high percentage of mechanical injuries develops the maximum amount of decay following washing without thorough drying. In the fruit that was picked with sufficient care to avoid serious injuries there was a comparatively small increase in the decay in the lots that were washed and not thoroughly dried before packing. It is probable that a greater difference in favor of very thorough drying would have been shown if more efficient methods of handling the specially dried lots had been available during the early part of the season.

Methods of Drying Oranges.—By heating the air blast used in orange dryers the relative humidity of the air is lowered, which increases its capacity for absorbing the moisture on the surface of the fruit. Experiments were made to determine the time required to dry the fruit under different conditions of temperature and humidity. The most rapid evaporation of the moisture on the fruit took place with dry air at a temperature of 130 degrees F. The time varied from approximately 11 minutes with an air blast having a temperature of 55 degrees and a relative humidity of 70 per cent to about one minute with air at a temperature of 130 degrees and 14 per cent humidity. The bearing on the methods of drying oranges under commercial conditions is shown by the considerable reduction in the time required for effective results when a dry air blast is used. The use of Calcium chloride in conditioning the air has not yet been demonstrated to be as effective or practicable for this purpose as heat. The temperature of the fruit was not increased materially after two minutes in an air blast at a temperature of 130 degrees.

Experiments were conducted with two different types of dryers. In one of these the roller conveyor was used and the air blast was forced through narrow openings above the fruit which was extended across the conveyor parallel to the rollers. The openings were formed by air nozzles about three inches wide, the air apertures being about one-quarter of an inch in width. In the other device a rope conveyor was used and the fruit passed through narrow trough-shaped runs, the air blast being forced on the fruit from the sides and bottom of the runs.

In the experiments conducted with the dryers it was found that infection with blue mold may be increased if the dusty air of the packing house is blown on the fruit in the air blast. In an efficient system of drying the cost of heating the air to a temperature of 130 degrees should not exceed one dollar per car of packed fruit.

NITRATE OF SODA ON SAND.

To the Editor: What is the best commercial fertilizer for light, sandy soil? I have not enough manure to cover all the ground this fall.—W. F. S., Ripon.

[Theoretically at least, the best way to use a limited amount of stable manure is to spread it more thinly and use with it a "complete" commercial fertilizer, which approximates its composition. Good practice is to grow a cover crop with fall and winter rainfall and to apply the fertilizer to push the growth of the cover crop, or to scatter the commercial fertilizer on the cover crop and plow the two in together. Nitrate of soda is also used to stretch out stable manure, but it should be applied toward the end of the rainy season usually, although of course it may be used to push a winter growing crop. On land not covered with plants to use it, nitrate should not be used while there is too much water moving to carry it away.—Editors.]

Three car loads of Pajaro valley apples have been shipped to Buenos Aires, Argentine Republic.

POTASH is so widely advertised and commercial potassium has been given such a prominent place in most of the experiments relating to soil fertility, both in this country and abroad, that the greatest natural source of potassium,—the soil,—like the inexhaustible atmospheric supply of nitrogen, is not generally understood or appreciated.

The fact is that the total amount of commercial potassium applied annually to all the farms of the United States is not more than is contained in one square mile of common corn-belt land to a depth of six feet, and the important potash problem is how to liberate it as needed from the inexhaustible supply already contained in all normal soils.

It seems plainly evident that potassium need not be purchased for use on normal soils for the production of the staple farm crops, but that it may easily be liberated in abundance by means of decaying organic matter, such as green manures, crop residues, and farm manures; and, of course, these materials, if applied in sufficient quantity, will supply nitrogen and liberate phosphorus from the phosphates naturally contained in the soil or applied to it where needed.—Cyril S. Hopkins in Illinois Experiment Sta. Bulletin 182.

Bumped by Bumper Crops.

To the Editor: I like your paper for the simple reason that it is the only possible way of becoming acquainted with reliable prices going in our dried fruit market. Think of the many millions annually spent on fool education all over the nation; and, remember that the American producer is just as ignorant as to what he should know about his business as the most ignorant savage. The middle men are well supplied with true and reliable figures. They recognize the fact that such knowledge is necessary in their business. We have no figures or facts; nothing but interested reports and guesswork to guide us in absolute darkness.

Again, you, like all other farming papers, indorse the bumper crop system. You teach that where one blade of grass now grows three should be grown to the advantage of all. And you recommend that all the waste land of the country be used in production. But it is an insurmountable truth that an acre of land kept out of the race of production may pay just as much or more that its neighbor, the acre planted to the same product, in the higher price that would prevail if some sort of check to our production were possible. It takes over a whole year to work off a bumper crop. It is not possible to figure on the time that will free the market of two bumper crops, and three bumper crops in succession will ruin the industry. Overproduction means underconsumption as sure as one and one make two.

How do the big trusts handle the problem? And they do handle the produce. Just the same as we do? No; they work in an entirely different manner. They first get the figures and facts—true facts, not middle men schemes. Then they find the demand, and produce according to what they can sell. If they can't sell a staple, they find it out before they raise the bumper crop, as the fool farmers do. If there is no demand ahead, they lay off and rest till the demand comes. They are able to sell stock and wax rich. Let us think it over.

W. N. Anthony.

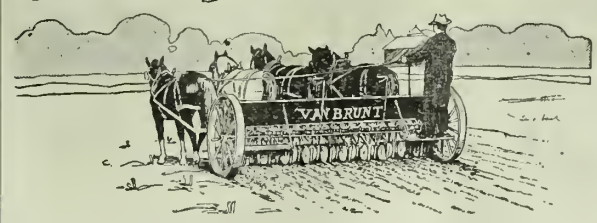
Cupertino.

ASPECTS OF THE OLIVE INDUSTRY.

(Continued from page 145.)

tween selling price and cost to cover interest, overhead, cost of selling, cost of damaged fruit and profit.

Oil Olives.—A ton of ripe olives will yield from thirty to forty gallons of olive oil, which, at a selling price of $2.00 per gallon, makes a gross selling price of $60.00 to $80.00, out of which has to be taken cost of fruit, cans, labor of expressing the oil, filtering, clarifying, etc.



The above figures are average and can be confirmed by any packer of ripe olives or producer of olive oil. For some grades of ripe olives more than $1.00 per gallon is received but at the present time there are thousands of cases of gallons being offered at 50c and 75c per gallon.

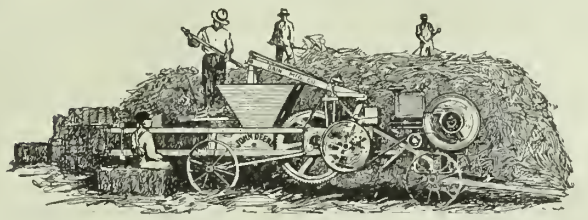
And so we have the problem; the next step is to find its solution. All of the large industries of California have undergone their critical periods. We have only to refer to the orange, raisin, walnut, almond and many other like agricultural branches to attest that they all must weather their storm. At the present time there is a California ripe olive association formed in Los Angeles, the object of which is to standardize the pack of ripe olives. This organization has for its motives the betterment of the olive industry, but those interested in northern California projects have been a little chary in joining—prompted probably by local jealousy. A second organization is under way in San Francisco, having for its purpose principally the exploitation of the olive industry. At the same time the American Olive Company (the largest packers of olive products in the state) realizing the significance of the present conditions, have sent a circular letter asking for suggestions to alleviate present conditions and take care of the coming crop.

The result of these nidividual endeavors is difficult to ascertain at the present time, but in order to succeed the keystone of the situation is that the popularity of the ripe olive and its greater distribution will have to center on a uniform product of good quality, and whatever evils exist at the present time will have to be eliminated or made subservient to the fundamental requisite: Uniformity of pack and quality of product.

Orange growers of Orange county report a light setting of fruit, some even estimating the crop at one-half that of th last season.

John Deere Implements

Van Brunt Single Disc Grain Drills



Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed — the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.

Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.

Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book at Package No. X - 152.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower,

Home Canning: Unfermented Fruits and Juices---VII.

[Written for Pacific Rural Press by W. V. Cruess, University of California.]

Most home-canning recipes for fruit juices call for boiling the juice. This is a very serious mistake to make, because the delicate flavor of the fresh juice is in many cases completely destroyed by boiling and is always very badly injured. Heating of the juice is necessary to kill the molds and yeasts present, but these can all be killed at 165 degrees F., which is 47 degrees F. below the boiling point. At 165 degrees F. a great deal more of the fresh flavor and aroma is retained than at 212 degrees F.

Containers.—Fruit juices attack tin; for this reason, glass bottles are most suitable. Glass fruit jars can be used, but are more expensive than bottles.

Extraction of Juice. — Berries, black grapes, and currants should be crushed, heated in a double boiler to about 130 degress F. and kept at that temperature until soft enough to press, or until sufficient color is obtained from the skins. The free juice can then be drained off through a sugar sack or flour sack and the remainder of the juice pressed out by twisting the bag. White grapes are pressed without heating. Berries and grapes are readily crushed with the hands or with a wooden potato masher or in some similar manner. Apples can be crushed with a meat chopper and pressed through a cloth placed in a small fruit press. Oranges, lemons, and pomelos are best handled by cutting in half and extracting the juice on a glass cone. The juice can be strained through cheese cloth.

Where a considerable quantity of juice is to be made it may be desirable to use some form of a small fruit crusher and press.

Clearing the Juice.—It is often difficult to make fruit juice perfectly clear and brilliant without more or less expensive filters. However, a jelly bag will frequently aid in giving a fairly clear juice. A heavy felt about ⅜ in. thick is best for this purpose. This is made into a conical shaped bag that can be hung up from two corners in a convenient place. It will be found that the addition of a handful of infusorial earth per gallon of juice will greatly aid in filtration. By starting the filtration in the evening, it may be allowed to go all night and time may be saved in this way.

If the fruit is fresh and sound the juice may be allowed to stand over night after pressing. It will deposit considerable pulp and can then be draw off from the sediment and strained through a jelly bag if so desired.

Some fruit juices will settle clear after pasteurizing in bottle. The finely beaten white of one to two eggs added to each gallon of juice before pasteurizing will often cause the small suspended particles to come together in flocculent lumps which settle out leaving a clear juice. The clear juice can then be poured or syphoned off from the sediment and repasteurized in bottle.

Bottling.—The bottles should be clean and should be scalded before use by putting them in water and bringing the water to a boil.

Beer or soda water bottles can be closed with metal, corklined caps. Small capping machines sell for about ten dollars; any druggist can give information as to where one can be bought.

Plain bottles or bottles of the above type may be corked with ordinary taper corks or wine corks of good quality. They should fit very tightly into the bottles. The corks should be sterilized by boiling about ten minutes in water. They should be taken directly from the boiling water to cork the bottles. Molds from imperfectly sterilized or leaky corks cause more spoilage of fruit juices than any other one thing. Corks must be tied down with string or held down by clamps during pasteurizing; caps do not require this attention. The bottles may be filled to within one to one and a half inches of the cork; a small space of this size must be left for expansion of the juice during pasteurizing.

Pasteurizing. — Pasteurizing of fruit juices is primarily a process of heating the juice to a high enough temperature to kill all molds, yeasts, etc., present so that the juice will keep. Secondarily it is used to coagulate the material causing cloudiness in the juice and in this way often causes suspended matter to settle out as a compact sediment. The clear juice may then be separated from the sediment, rebottled, and pasteurized.

A temperature of 165 degrees F. should be reached inside the bottles to insure that all molds are killed. A wash boiler with a false bottom of heavy wire screen or wooden slats makes a convenient pasteurizer. The bottles are placed in a horizontal position on the false bottom—they may be stacked into the pasteurizer four or five layers deep if necessary. Placing the bottles horizontally makes certain that the corks or caps be well heated. The boiler is then filled to two or three inches above the bottles with cold water. One bottle should be closed with a cork through which a thermometer is fitted, the bulb of the thermometer being well immersed in the juice or water in the bottle. The water is heated slowly until the juice in the bottles reaches 165 degrees F. and is maintained at this point for about five minutes. Or, if it is inconvenient to fit a bottle with thermometer, the water in the sterilizer may be heated slowly to 170 degrees F.; this temperature should be held about five minutes. This will insure a temperature of 165 degrees F. in the bottles. The juice should then be removed and allowed to cool, preferably in a horizontal position so that the corks are given a thorough heating to kill any molds that may have gotten on the corks during corking.

If corks are used, they must be paraffined heavily after pasteurizing so that the vacuum formed on cooling will not draw in mold spores, through pores in the cork. Dipping the ends of the bottle in melted paraffin several times will coat them satisfactorily. Caps do not need to be paraffined.

Settling and Clearing Pasteurized Juice.—If the juice settles clear several days after pasteurizing, the bottles may be opened, the juice separated from the sediment, rebottled, and pasteurized as described above.

Great Britain has agreed to the importation of German sugar beet seed provided it is shown that the seed is purchasable only in Germany and that shipments are made from a neutral port.

SECURITY
ORCHARD LADDERS
TRUE TO NAME

THE AIM—To produce a ladder that would stand up under hard orchard usage and give to the user the feeling of safety.

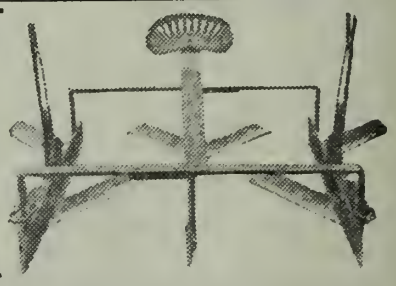
THE CONSTRUCTION—Expert workmanship and high-grade materials combined with the SECURITY idea—step-joints of galvanized sheet steel.

Rear view SECURITY Step Joint

THE RESULT—Rigidity—Wrapping the stile in steel at every step gives, to the SECURITY alone, the added strength where the greatest strain comes.

Years of Service are assured and rigidity retained, in the SECURITY, after original steps are worn out, by simply inserting new steps in the steel joints. This renewal can be quickly made without unwrapping steel from stile.

SECURITY 8-foot Tripod



DISTRIBUTION—SECURITY ladders are now sold by dealers in 96 Coast fruit centers. The name of your SECURITY dealer and your copy of the 1915 SECURITY booklet will be mailed on request.

SPECIAL—An attractive introductory offer will be made to you if your section is not yet served by a SECURITY dealer. Write for it.

HORTICULTURAL NOTES.

The first car of Thompson Seedless grapes from Dinuba realized in Chicago $1643, an average of $1.77 per crate.

With the supply from Turkey cut off, large quantities of California raisins are being bought up for shipment to England and France.

The Malaga grape crop in the Kerman district of Fresno county is reported good and packing will, it is expected, commence within a week.

The Farm Adviser of Solano county will hold meetings at Rio Vista, August 17th, Vallejo, August 19th, Suisun, August 24th, and Dixon August 26th.

County farm advisers will meet at Berkeley to attend the convention of the American Association of Agricultural Colleges and Experiment Stations during August.

A number of fruit growers of Tulare have formed the Tulare Fruit Growers' Association, the charter members being chiefly peach orchardists.

Offers of 77½c. per box are reported to have been made for Bellefleur apples from the Pajaro Valley. The fruit is said to be showing good size and high quality.

The Farmers' Union of Gridley sold to Libby, McNeil Company almost the entire crop of Tuscan cling peaches in that district, amounting to 100 tons, the price being stated as $8 per ton.

The grape crop in the Lodi district of San Joaquin county is said to be about two weeks later than last season. Some Thompson Seedless have been shipped and other varieties are showing well.

About 20,000 tons of raisins constitute the holdover from last season's crop, but it is hoped to dispose of these before the new crop is ready, with chances for better prices for the latter.

Eighty million is the estimated loss of the fruit growers of Palestine owing to the seizure by the Turkish government of all petroleum, etc., leaving nothing that can be used for spraying and running irrigating power.

County Horticultural Commissioner Lamiman of Shasta county estimates the prune crop for this year in the Anderson valley at 1500 tons, which is somewhat above the average. The fruit, he said, was of fine quality.

In the Dinuba district of Tulare county, the price of watermelons at the end of last month fell from $15 to $3 per ton within a couple of days. A good part of the crop, however, had been contracted for previously at $6 per ton.

Apropos of the European demand for California green and dried fruits, freight rates have advanced to such a point as to make the shipments of some products unprofitable. Apple shippers especially view the situation with apprehension.

A section of the prune growers are jubilant at the prospect of good prices owing to the demand for their product in Europe. With the crops of eastern Europe practically eliminated and France with scarcely half a crop, their joy would seem justified.

Another group of prune growers advocate a more energetic development of the markets of the United States instead of leaving the demand dependent upon the European situation and trusting to the countries over there taking up the surplus.

Turlock has been the shipping point for nearly 400 cars of cantaloupes and watermelons in less than three weeks. It is estimated that the total shipments for the season from there will reach 1000 cars. One of the local papers makes it 2000 cars.

To create the demand for prunes which will meet the increasing production, Santa Clara Valley growers are said to be considering the launching of an enormous advertising campaign conducted along the lines so successfully used by the manufacturers of the various breakfast foods.

Mr. L. B. Gladden of Healdsburg writes that the report of heavy damage to Jefferson plums by brown rot in Sonoma county was exaggerated and that out of a lot of several tons he sold to a cannery he does not think 3 dozen were affected. He also reports an exceptionally heavy crop in the Russian River valley. It is in good condition.

If the fruit standardization act, in effect August 9th, is held up, and shipments go forward as of old, it is because a comma has been discovered which might apply the regulations to fruit sold within the State. This would result in the loss of a tremendous tonnage of good fruit with just enough defects to

Mechanical Power on the Farm.

CYLINDER OIL VS. HEAT.

"Consideration of the properties of cylinder oils, and analysis of the conditions under which they lubricate, lead us to the belief that a large majority of the complaints about cylinder oils can be accounted for as due to ignorance regarding the principles governing their use." So says Lieutenant G. S. Bryan of the Naval Engineering Experiment Station, Annapolis, Maryland. Continuing, his article in the Journal of the American Society of Naval Engineers for February states:

"The three essential requirements of a good motor cylinder oil are: (1) It must lubricate the piston efficiently at the temperatures encountered in the cylinder. (2) It must give a good seal to the piston and rings, keeping them tight and preventing leakage of the oil and condensed gasoline past them. (3) It must burn without forming carbon deposits in the cylinder when an excess of the oil gets into the combustion space.

"We have seen that with the water boiling in the jackets the temperature of the inner surface of the cylinder walls will be about 267 degrees F. The temperature of the layer of oil that is in immediate contact with the cylinder walls, which is the part that regulates the friction, cannot be much higher than this. I do not know of any motor oils that have a flash point lower than 325 degrees F. If the temperature of the cylinder walls gets up as high as this in a water-cooled motor there is something radically wrong, and the remedy is not to get another oil of higher flash point, but to locate the trouble and remove it.

"It is an old theory that was never founded on solid facts, that a high flash point is a necessity in a motor oil or the oil will burn up without giving any lubrication. The point was overlooked that, when we have a maximum temperature of the gases in the cylinder of 2,700 degrees F. and an average temperature of 950 degrees F., an oil with a flash point of 450 degrees F. will offer but little more resistance to burning than one would of 350 degrees F.

"Either oil will burn if kept for any length of time in contact with the hot gas; lubricating oil does not burn very easily or very fast, however, and the time given for it to burn in a motor is very short."

WATER-WHEEL IN SLOW STREAMS.

To the Editor: We are located along Putah Creek, which flows by Winters. Perhaps you know about the size of this stream in the summer time. Is there any way to use the current in the production of electricity, either by wheel or hydraulic ram? And what arrangements could be made about the winter floods? Is there any concern on the coast engaged in this kind of business? Most of these hydro-electric plants get the benefit of a considerable fall, but I was wondering if the force of the current couldn't be used.—G. W. M.

[Answered by J. W. Swaren of the Pelton Water-Wheel Co.]

At the point where Mr. Morse proposes to utilize Putah creek the fall is comparatively small, with very high floods during the winter season and comparatively little water in the summer-time. Evidently he has in mind the utilization of what is known as a current-wheel. These are employed in many places along the Sacramento River for lifting a small quantity of water above the bank level, but develop comparatively little power—not quite enough to make it worth while to install electrical equipment.

The power of falling water can be calculated from the following formula:

$$P = \frac{Q \times H \times 62.4}{33{,}000}$$

—where "P" is the horse-power; "Q" is the quantity of water in cubic feet per minute; and "H" the head or fall utilized in the water-wheel. In the curent-wheel the head utilized is only the velocity of the stream, and is but a few inches.

The best way to develop water power is to combine the flow of water

in a closed pressure pipe, thus conducting the water under pressure to the water-wheel, which may be either of the Pelton or the Tangential type, or the Turbine type. If Mr. Morse can build a dam so as to divert the flow of water he might be able to utilize a low head turbine if he could get a fall of 8 or 10 feet. This is rather an expensive method of developing power, and the preferable method is to divert his water, carry it in a ditch or flume about the brow of a hill to a point where a fall of 40 feet or more is available, and the pressure pipe will not be more than 8 to 12 times the head.

Under these conditions a small hydraulic electric plant can be developed with comparatively low expense. But the greater the head or fall available the less the cost will be, until the head becomes excessive, say 250 feet or more, thus requiring special consfruction.

WHO HAS PUT A CORE IN A DITCH BANK?

To the Editor: The Questions and Answers in your paper are to me the most interesting part of it.

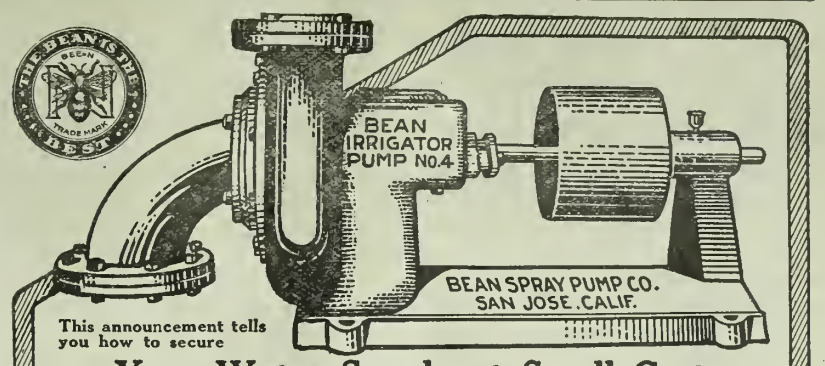
We are bothered with the water washing or breaking through the banks of our irrigation ditch. We have a ditch about five miles long. The people that use it had to build it, take care of it, and keep it up. It will carry about a thousand inches. The soil is sandy, but the ditch gives a good deal of bother with washouts. It seems to be caused by rats or something of the kind. Often it is a washout, and we cannot tell the cause, but I suppose it is caused by lizzards, horn toads, or a rat which I call a Kangaroo rat.

To cement the ditch is too costly. I was thinking we could make a ditch or slot, or whatever it might be called, about two inches wide and as deep as the bottom of the ditch—do this on both sides in the center of the bank, and go down so as to be about as deep as the bottom of the ditch (which would be from 4 to 6 feet), and fill this with cement and sand; put in cement enough so it would be hard for the rats, squirrels or anything else to dig through, or so if they dug from either side they could not go more than half way through.

Can any one give us any idea how this could be dug? It might cave in some, but I don't think it would be much, as we could fill the slot with the cement as fast as it was dug. Some of these places would be 30 rods long, some 10, and so on. Can the editor or some reader give any pointers on this or any other way? I have been looking after the head end of this ditch, or about two miles of it, and it is enough to make a man crazy to do this and do his farm work.—E. L. Winton.

[The insertion of such a core is theoretically possible, and there is no doubt that it would end rodent troubles; but to get it in place would be expensive and difficult. We never saw such a core, nor do we find record of one. The question is up to readers for answer. We can guess that to cut in such a narrow slot to such a depth would be found impracticable, and that making the trench wider would save as much in labor as it would cost in more concrete to fill it. We can guess also that it would be cheaper to cement the ditch banks than to core them. The subject is open to discussion.—Editors.]

TRACTOR DIGS DITCH.



An International tractor running plows and a road grader, is digging a long irrigation ditch in the low-lying flat lands of Yolo county, for A. W. Morris and Sons. The tractor straddles the levee it throws up. It is much needed now because the late spring prevented damming the creek until the alfalfa needed the water.

LOOK!

On two adjoining ranches under identical conditions the same amount of water was pumped. One owner used electric power; the other used a **COMMERCIAL GAS ENGINE.** Electric power cost the one $1800 a year. The other bought $400 worth of distillate, and at the end of the year had $160 worth of distillate unused, **making** a total power cost of only $240, an actual instance of saving money that should **make you** write for further particulars and Catalog 18-R. Do it now!

Commercial Engine Co.

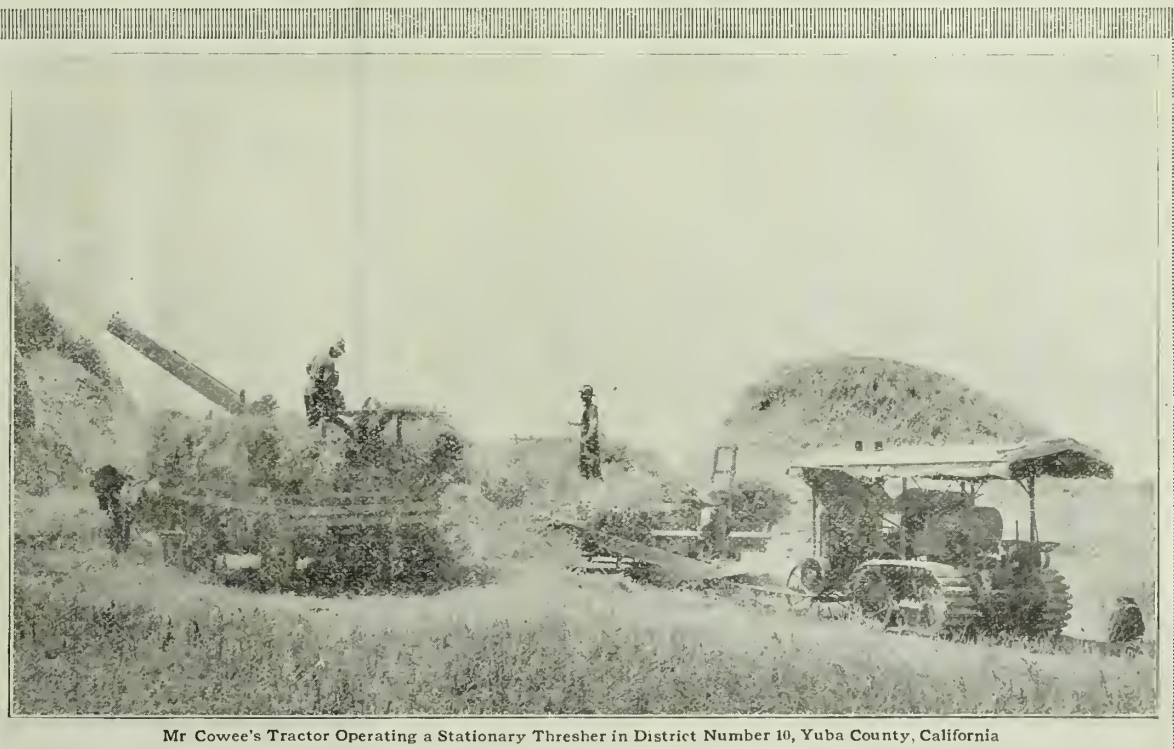
This announcement tells you how to secure

Your Water Supply at Small Cost

At last—a high-grade, efficient, dependable centrifugal pump at a low price. The Bean Irrigator introduces a new standard of pump values. Though the price is as low as the lowest—the pump is "Bean quality" through and through. If you're interested in irrigation you should learn about

Bean Centrifugal Pumps



For Downright Good Service They are Absolutely in a Class by Themselves

The Bean Automatic Water Balance eliminates end-thrust, thus saving much trouble.
The Bean Water Sealed Stuffing Box makes excessive tightening of the stuffing box glands unnecessary. The shaft where it enters the pump is entirely surrounded by water, which forms a perfectly air-tight seal with very little friction.
Bean Runners are Enclosed, accurately machined and perfectly balanced. This means greatest possible efficiency.

SEND FOR BEAN CATALOG 28-B

It illustrates and describes the Bean line of Horizontal and Vertical Centrifugal Pumps, Bean Turbines, Direct Connected Outfits, etc. Tell us your pumping requirements. The experience of our irrigation specialists is at your command. For our general line of House, Windmill, and other Pumps, ask for Catalog 28-D. For Bean Opposed Gas Engines ask for Catalog 28-C. A postal will bring any or all of these catalogs by return mail.

Mr Cowee's Tractor Operating a Stationary Thresher in District Number 10, Yuba County, California

PROGRESSIVE farmers are *Yuba Ball Tread Tractor* owners. They own *Yuba Ball Tread Tractors* because Yuba Tractors are efficient and economical—built to work under any condition—the balls reduce friction—the tread travels over soft soil as though it was a macadam road.

¶ The Yuba Ball Tread Tractor performs every operation on the farm, and in doing so increases your profit. It need never be idle; if you cannot use it your neighbor can—and at a profit to you.

THE YUBA BALL TREAD TRACTOR

When at the Exposition see the Yuba Ball Tread Tractors in the Palace of Agriculture. They were awarded a Gold Medal and a Medal of Honor.

Have you had a profitable year? We hope so. Here is a Yuba Ball Tread Tractor owner who has. He has plowed his field, then cultivated it; harvested his crop, and when he is finished threshing, he will couple his Yuba Ball Tread Tractor to his wagons and haul his grain to town.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

SUMMER CARE OF THE YOUNG STOCK.

This is August, therefore all stock hatched in the spring months should be well along, while those hatched in late May and June have not attained quite the size. Now unless the older ones are kept by themselves, it is pretty certain that the late hatched ones never will catch up.

Separate the Sizes.—Over-crowding is responsible for many things, but when the over-crowding is done by mixed sizes it is more disastrous than ever. It seems to be a law of nature that the strong must prey on the weak, and in the case of running mixed sizes and ages of poultry together it does work beautifully, for the small ones appear to shrivel up and get smaller while the big fat ones get fatter and bigger. During the past week I have answered five letters from people with troubles among their poultry and turkeys, that if traced up, every case found its origin in overcrowding.

The reason for most of these cases is the care-taker getting tired of the job, or thinking that because the stock had reached a certain age or size they could take care of themselves. They feed and water regularly and think that is all that is necessary. But it is not all by any means. If the stock are running loose it is necessary to look at them after they have gone to roost to see if there are too many in one house. I have seen times when chicks would all pile in one house and leave the rest empty.

Another thing to remember is that all the time they should be growing and require more space, so if they are yarded one needs be watching for the crowding just the same.

Give them all the room you can both day and night and the chicks or turks will reward you with growing fast and keeping so healthy that it will not cost you a cent for anything except food. And by the way, that cost is enough, these days, but when we add to it a drug bill every little while, not counting the dead chickens, it comes too costly to be ignored.

And when we consider that it can be avoided by exercising a little extra care and watchfulness it really is time to think a little and then act.

Dangers in Bunching.—I am often told that the chickens appear to sweat. Now this is a mistake; the wet condition they are in when they leave a box or house where they have been crowded, is due to the condensation from the bunch. When they crawl out in that condition, on a cold, raw morning it is no wonder that they get cold and roup; they simply can't help it, especially if they must hang around waiting for their breakfast. So that the very best advice anyone can give is, "to see that your flock have room, not only that but see that they utilize the room you provide." When chickens have started in to bunch up at night instead of spreading themselves out over more floor space, or taking to the perches, it is quite a little task to get them cured of the habit. The best way I know is to make up all corners, either with boarding up or nailing wire across, then spread a good thick layer of straw or other litter over the floor and put the perches so low that they will not be comfortable under them. The litter will prevent them from bunching up and eventually they will take to the perches.

Spacing on Perches.—All the small breeds are quite willing to perch, if given the opportunity, before they form the habit of bunching up; that is why I advocate going over them at night with the hand, after they have gone to bed for the night. If you are gentle with them and they know your voice this never alarms them and you can often spread them out over more space without raising a flutter. If you can't do it quietly, why it is better left undone, for a frightened chick is worse than a crowded chick, and neither are of much account, except to eat.

Do Not Excite the Hens.—There is a great deal of difference in the way one goes among chickens. I always talk to mine and when out of range if they hear my voice they always run to me, never away from me, unless a stranger is present, and I do not encourage strangers among my birds.

Some fanciers advertise "visitors always welcome," but I never have been able to feel so charitably inclined as to spend my time and annoy my poultry showing curiosity seekers around. One time a lady called to look at them and she had on a red sweater. I told her that I was afraid she would scare them with that red garment, but she did not take the hint so I took her to the first yard and the hens all ducked as if they had seen a wild man from Borneo, so I just excused myself at once by telling her that the hens were not used to strangers and it would make infertile eggs to have them scared so. And as a test I kept the eggs from that yard separate for several days, then incubated them and they were over 60 per cent infertile during that time. Since then I have been very chary of visitors, though chickens will get used to other animals and dogs and not mind them at all.

Guard Against Vermin and Feed Properly.—The next thing to look out for this month is mites, don't ever let up on the mite question. Because you sprayed a house on such a date, don't think it will last indefinitely, keep your eye on it—it may be all right, but you want to be sure.

An investigation by the Department of Agriculture has revealed a practice on the part of certain dealers in California of purchasing smutty barley, treating it with lime, and after mixing it with clean barley free from smut selling the mixture as choice brewing barley. The lime conceals the smut so that it cannot be readily detected by the eye, and after the limed smutty barley is mixed with clean barley, grain inspectors cannot detect the smut. The Department announces that this practice of liming smutty barley constitutes an adulteration under the Food and Drugs Act.

Now is the Time to Feed
Coulson's Egg Food

to your pullets as well as your hens, commencing at the age of three months.

Notice to Cadillac Owners Who Will Visit the Exposition

Friday, August 20th, has been designated by the Panama-Pacific Exposition officials as Cadillac Day.

In honor of this event we will hold a tour from all sections of the State to San Francisco for Cadillac owners.

The party will leave Los Angeles August 17 and arrive in San Francisco on the morning of the 20th, in time to enter the Exposition grounds with the other Cadillac owners who will arrive from Northern points.

Don Lee representatives will accompany the tour, leading with a pilot car and following with an emergency car for assisting tourists, if needed.

Cadillac owners wishing to join the tour, please write Tour Committee, Don Lee, Los Angeles, Cal., Fresno, Sacramento, Pasadena, Oakland, or San Francisco.

How to Make Broody Hens Lay Promptly

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n of California]

In co-operation with five thousand actual poultry keepers of that State, the Missouri State Poultry Department, at its experiment station near Mountain Grove, is doing work that is of great benefit to the whole country. An instructive report has recently been issued regarding the cause and effect of broodiness of hens. It contains more practical information than any similar statement we have seen; and because we, in this State, are breeding more of the heavy varieties each year, the subject is of particular interest to us. However, this report being based on observations made at the one point in Missouri—and the climate of the whole state is very much alike—it cannot be expected that the same exact results would occur in California; but much benefit may be gained from a careful study of the contents of this report. What a pity the State of California has no such institution co-operating with the poultry keepers of the State, who are eager to solve some of the peculiar problems that confront them in various parts of this State with its multitude of climatic variations.

The report states in part: "There is an idea generally prevalent that when a hen begins to lay she has a certain number of eggs to lay, after which she goes broody. This idea has been proven incorrect as the production of eggs has been proven to be an endless chain which continues according to the ability given the hen by naturc, unless it is interrupted or broken by broodiness or some outside influence such as change in weather, location, etc.

"From the investigations we have made so far, we are convinced that broodiness is a condition of the brain and not of the body, for at the time the hen goes broody she is in a laying condition, having the different parts of the egg partly developed; but because of staying on the nest, lack of exercise, loss of appetite, and lack of nourishment, the hen takes the egg material back into her own system and uses it as nourishment just as hens do when a sudden change in weather stops them from laying."

The above is full of good educational matter, but we doubt if broodiness is a condition originating in the brain. We are inclined to this belief—or rather lack of belief—because of the great variation of the brooding instinct displayed by hens in different parts of California. Hens are not inclined to set as often in sections where the variation of temperature each 24 hours is great—say 35 degrees or more—as in locations having a very even temperature during the day and night, unless those in the varying climate are fed a ration very rich in carbohydrates and fats—and neither will they lay as well unless so fed; this applies both in summer and winter if the daily variation of temperature continues through the year. Consequently we have been inclined to think that broodiness is due to some peculiar physical condition (possibly directly affecting the brain), brought about by the amount of oily food consumed — particularly vegetable fats—in proportion to the protein and carbohydrates. Supposing that we are correct thus far, what develops the disposition to set—a sudden reduction in the amount of fats provided in the feed or a failure to vary it to match the variation of maximum and minimum temperature?

Illustration showing effect of continued broodiness on the primary egg-producing organ—the ovary—of a hen. From left to right it shows the condition as follows: At the end of twenty-four hours. At the end of ten days. At the end of three weeks. This demonstrates the importance of immediately breaking the hen of broodiness before the ovary begins to shrink and the partially formed eggs are transferred into other channels of the system and absorbed as nourishment.

The report further states: "In order to give an idea of the relation of egg production to broodiness, the following table is given. This table is the record made by 1040 hens in the National Contest here at this Station in 1913-1914:

NO. OF EGGS LAID BY	NO. OF TIMES BROODY.								
	0	1	2	3	4	5	6	7	8
Wyandottes	147	139	165	159	155	171	173	175	152
Orpingtons	127	133	134	135	170	146	160	163	142
Plymouth Rocks	158	155	164	179	149	162	143	163	
Leghorns	154	147	125	156	215	163	165	162	
Rhode Island Reds	153	177	163	156	153	141	144		
Langshans	121	159	100	164	167	150	139		
Anconas	155	148	146	163					
Minorcas	138	176	143	138					
Campines	135								
Averages	143	154	142	156	168	155	154	165	147

"By studying the table it would indicate that the best hens lay 168 eggs and go broody four times per year.

"The principal point to be noticed here is that it is not a safe rule to select the non-setters as the best layers."

Another table too long for publication shows that all hens that laid less than 100 eggs, averaged going broody one and three-quarters times each; those laying between 100 and 200 eggs, averaged going broody two and one-half times each; and all laying over 200 eggs, averaged going broody twice each.

This corresponds very nearly with the writer's experience in the San Francisco Bay district with Plymouth Rocks and Buff Orpingtons; the hens that were broody from two to three times were the best layers according to the Hogan method of judging; and, when records were kept, in nearly every case it was demonstrated that they produced the largest number of eggs.

The report further states: "The plan followed here at the Experiment Station is to place the hen in the brood coop on the day after she remains on the nest and does not lay. She is kept in the coop four days and then released. During the time she is left in the coop, she is given all the feed and water she wants. About 4000 hens are treated in this way each summer at this place. The records show that hens broken in this way begin laying again as follows: The time from the laying of the last egg till the hen began laying again was 10 days in March, 8 days in April, 10 days in May, and 12 days in June. There were more broody hens in June than in April, but for practical purposes we might say the average is 10 days."

It is demonstrated that prompt action is necessary to break up the broody hen if it is desirable to have her in laying condition in a short time. After 24 hours on the nest, a very great change takes place in her system, which requires many days to remedy. We might also add that in California an almost exclusive diet of yellow corn, or other grains containing much oil, fed for three or four days, greatly assists in quickly bringing the broody hen into her laying condition.

The Pacific Rice Growers' Association has been duly organized at Biggs, Butte county, and officers elected. The board adopted articles of incorporation and outlined its future policy. The association will work hand in hand with the Southern Rice Growers' Association as a protection to the rice growers of the west.

Poultry Breeder's Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

WE ARE BOOKING ORDERS for Fall and Spring hatching now. White and Brown Leghorns; Barred and White Rocks; Black Minoreas, Rhode Island Reds; Buff Orpingtons and Anconas. No deposit required with order until 30 days previous to delivery of chicks. Large orders a specialty. Santa Clara Valley Hatchery, R. 6, San Jose, Cal.

EXPERIENCED POULTRY MAN wants position as working manager commercial plant, any size. American. Married. Steady, sober, all-round mechanic. References, Box 523, Pittsburg, Cal.

IT IS not advisable to jump suddenly into any phase of the stock business. Profits are rarely large enough to absorb unusual costs for equipment or cover losses due to inexperience. Only the pastmaster in the stock business can hope to speculate successfully in this way. The average farmer may safely initiate a gradual change from grain-growing to live stock farming, or enlarge an already established small stock business. A little flock of ewes, or a half-dozen sows and their pigs, an extra cow or two, or a pair of mares to replace a span of mules—none of these can break a man's fortune or courage if they go wrong, and if rightly managed any of them can add materially to the farm income.

Stockraising is something to enter into for a decade or a lifetime, not for a year. Bankers' assertions, farm management surveys, crop yields at the end of a generation, all reflect the greater income of the livestock farmer. So true is this that the richest states and counties are live stock regions. To step in at once and attempt to share this wealth is risky. To stock up gradually and build equipment as returns justify expansion is the safe way to work the transformation.—Breeders' Gazette.

Placing the Blame for Cheap Butter.

[Written for Pacific Rural Press.]

In a previous article the statement was made that "no great industry of a State can grow with safety faster than its markets." It was also pointed out that the dairy industry of California has now reached a stage of development that demands closer attention to outside markets and their requirements and that the development of Pacific and Atlantic Coast markets means the expansion of California's dairy industry to unlimited extent if we will just improve our quality.

Peculiar as it may at first seem, there is but one faction in the production, manufacturing, or distributing of dairy products who appreciates the situation. That faction is the large distributor who has been confronted with the problem of marketing small surpluses in the past, or the manufacturers operating on a large enough scale to warrant their own distributing system.

When there was no surplus butter, it was comparatively easy to sell butter, even though it was second quality, for it was "Hopkins' Choice" with the wholesaler or retailer. He could take what the local market offered or leave it alone. Naturally he has taken what he could get, and kept still. To put it another way, the California butter markets have accepted a lot of inferior butter at a reasonable and many times a high figure because California controlled her own market. In at least one case this control has even gone so far as to force the entire butter production of one of our largest dairy counties upon retailers and consumers as extras when it was, as a matter of fact, largely a second quality product.

It was argued, and perhaps justly from the standpoint of that day, that the California consumer was willing to stand for such a condition of affairs and that the dairy industry was benefited to the tune of thousands of dollars annually. The theory of the thing was and still is among a vast majority that the consumer hasn't been hurt, and the producer through higher prices has been allowed to further develop along production lines.

While the average manufacturer may have known of this condition in a roundabout way, he has not been in a position to know or particularly care where the thing led to, for his has not been a marketing problem on a broad scale nearly so much as it has been a manufacturing problem. As long as his butter over and above what he sold to his local trade could find an outlet through the distributor on the large market, he did not deem it his business to delve into the distributors' problem.

As with the creamery man, so with the dairyman. He has been first of all interested in production with its confusing problems. His chief interest in the creamery business has been in his cream check. He has not interested himself in the manufacturing or distributing problem because he recognized the specialization that both branches involved. And so we find that the distributor is the creamery's keeper and the creamery the dairyman's keeper, but above all that the market is the keeper of the entire dairy industry.

As has been shown, the industry was all right as long as we could confine our production to our own markets and stave off competition from distant points.

From the distributors, who we have shown are the only ones at present in a position to know the actual marketing conditions, we learn that we are several million pounds of butter over our consumption, also that New Zealand and Australia will doubtless make a play for a part of our future trade as they did after the tariff was reduced.

When asked how we are to broaden our market and at the same time exclude foreign competition from our own markets, the answer of the distributor invariably centers on one factor, "a better and more uniform product." Past experience, so we are told, proves beyond a single doubt that this is the pivot around which the future market hinges.

For example, we are informed by one of the largest distributors in the State that the British Columbia market offers possibilities for California butter; in fact, was taking an ever-increasing amount of it till New Zealand entered. Since then California dealers have been forced out. Why? Because the foreign product was of uniform high quality, whereas the California product was not.

During the present year about a million pounds of butter were shipped to the Chicago and New York markets. This butter was the make of various creameries in the State and varied greatly in flavor, color, salt, and style of package. Naturally enough, when the Chicago or New York buyers asked for a certain grade in large quantities, we could not supply them due to the lack of uniformity. This meant a severe slashing of prices, with the result that the million pounds sold at no profit, but rather an actual loss in some instances. The only benefit accruing to our butter industry was the relieving of our markets that much, which allowed it to hold up better. In other words, we sacrificed on a million pounds in order to realize a better price on the remaining supply. This condition is being somewhat improved by the enlarging of daily production at a number of our large creameries which permits the making up of carload shipments of one brand, thus insuring uniformity.

The dealers point out that this condition is avoidable; that the British Columbia market can and will be won back, and the eastern market profitably shared as soon as the producer and manufacturer take steps to co-operate with the distributor in supplying said distributor with a high and unform grade of butter. He predicts that our market outlook is as appealing as our production outlook, and that the producer, manufacturer, and distributor will work together toward a bigger and better dairy industry which is certain to come with advancing years just as soon as the condition and its solution are thoroughly understood by all concerned.

INCREASED PORK PRODUCTION.

W. S. Guilford of Willows, Glenn county, says, "An increase in the pork production of California must come largely from the intensely cultivated, diversified farms that are being developed all over California.

"On farms of this type a very fine quality of pork can be produced. The breeding stock can be given the best of care and attention, and the pigs can be cared for and fed in such a way as to insure continuous and rapid growth. A wide range of good feeds is available, including alfalfa, insuring variety in the ration—and some of these will be by-products from other farm operations—such as skim milk, barley, stubble, waste fruits, cull vegetables, table scraps, etc.

"Plenty of grain can be grown to finish the hogs as they should be and make a carcass that is a source of satisfaction not only to the butcher or packer but to the consumer."

The increase in cattle shipments over the Western Pacific railway caused the company to inaugurate, on August 1st, a special cattle service. This train leaves Doyle on the Nevada line at noon and lands the cattle in "Butcher Town," San Francisco, by 11 a. m. next day. This includes picking up intermediate shipments on the way down.

Kirstin

One man stump pullers cost less, weigh less, more power, 2 variable speeds, ten year service guarantee with every machine. CATALOG FREE

With Patented Wheel Weights for Rough Country and Extra Hard Soils

Convertible to 1-Furrow Extra

"THE GROUND HOG"

MADE IN 2, 3, 4, 5, 6 and 8 FURROW SIZES.

SOIL NEVER GETS TOO HARD AND DRY FOR THIS PLOW.

Plow your land dry. Do not wait for rain. It may not come till too late.

MR. FARMER, DO YOU KNOW that over 1,000,000 California acres were not cropped last season, largely because weather conditions interfered with plowing. Were you among the losers? Don't be caught again. With "The Ground Hog" no matter how hard and dry your soil, you can plow this fall before the rain sets in—insuring big crops. European demand insures you big prices.

BUY A GROUND HOG NOW. It will pay for itself this Season and give you a handsome profit besides.

We manufacture both Horse and Tractor plows. Our plows for small tractors work where other plows have been strained or pull to pieces.

Write for prices and full particulars.

Spalding-Robbins Disc Plow Co.

461 MARKET STREET, SAN FRANCISCO.

Milk House and Equipment for New Law.

To the Editor: I expect to put up a dairy house soon; will use space under my tank which will give space of 15x15. What would be the best material for walls to make a strictly sanitary room? Would it be objectionable to use the same room for bottle washing, handling and bottling milk? Of course, only one would be done at a time. What size boiler (h.p.) would be required to operate a single bottle washer and sterilizer which sterilizes 24 at one time—not over 250 bottles washed at a time? What h. p. boiler would be required for a pasteurizer of 40 or 50 gallons capacity?

Also, in a brief way in plainest language, can you state in your valuable paper exactly what a dairy man will have to do to meet fully the requirements of the pure milk bill to take effect October 1, 1916?—Constant Reader, San Luis Obispo.

[A concrete plaster wall would very likely be the most satisfactory one for your purposes. The following specifications give a detailed plan for the construction of such a wall:

First put in extra studding or uprights and ceiling joists so that none of them will be more than 16 inches in centers.

Use wood laths—1¼ inch Oregon pine, free from bark and other defects. Space the laths ⅜ in. apart and nail them well to every stud and joist. Break the joints every eighth lath.

After the laths are in place and before the plastering is to be done, the laths must be thoroughly wetted. The laths must not be dripping wet when the mortar is to be applied, but must be so damp that they will not absorb any of the moisture from the cement mortar. As dry wood quickly absorbs the moisture which should be held in the mortar, the mortar is weakened and sometimes ruined by failure to wet the laths before the mortar is applied.

It is more satisfactory to have an experienced plasterer do this kind of work; however, a little practice on a sample lath panel set in an upright position will enable one to do a fairly good job.

The first or scratch coat shall be ⅜ inch thick and shall be in the following proportions:

4½ parts Portland cement;
½ parts prepared hydrated lime.
10 parts clean coarse sand.

Thoroughly mix the cement, hydrated lime, sand and the hair or fibre while all the materials are dry and never mix the cement and lime with sand that is wet or moist.

When you are ready to begin to plaster, then wet as much of the mixture as you can apply, say, in thirty minutes. If you are not accustomed to work cement, you should not risk wet mixing too much of it in the beginning for the cement sets quickly and must be applied to the wall or ceiling before it sets.

By practicing first with the sample lath panel, you will find just how much water to add and yet have the mortar wet enough to work without dripping off the wall.

The first coat must be scratched or roughened up with the edge of a trowel so that the second coat can have a better hold. Do not trowel the first coat to a smooth finish.

The second coat will be ⅜ in. thick and will take the balance of the material heretofore mentioned; no fibre or hair will be used. The proportions will be the same as stated for the first coat. This coat will be so troweled that the surface will be smooth. If possible, finish the corners with roundings or coves, which are more easily cleaned than sharp corners.

The question of whether it would be objectionable to use the same room for bottle washing, handling, and bottling of milk is one which will have to be decided largely by present or future milk regulations in the city in which you deliver your milk. The State law at present does not prohibit such a practice; and if your city regulations there do not cover the subject, you are perfectly safe in including the entire operation in one room. Some of our cities have regulations that prohibit this and the question revolves around what your future regulations there will be.

A one and a half h. p. vertical boiler would be large enough to run your bottle washer and sterilizer, but it would be more economical in operation to have a two h. p. boiler of the same type. To furnish power for bottle washer, sterilizer, and pasteurizer, of 40 or 50 gallon capacity, you should have nothing less than a four h.p. vertical boiler.

A resume of the new milk and milk products law was printed last week. We might add for your benefit that the most serious question confronting the whole milk dairyman with small herds such as you have, is not so much the pasteurizing of milk as it is the proper cooling of milk after pasteurizing. To keep milk any length of time after it has been held at a temperature of 140 degrees in the pasteurizer, it should be immediately cooled to around 40 degrees F. This is best accomplished by a supply of brine or ice water through which the milk is run. In case you do not have the facilities for doing this, you can build a refrigerator in which the temperature is kept down by the use of ice, or pack your bottles after bottling with ice.

So far as we have been able to learn, the Attorney General has not given his opinion on the law, but it is generally thought that in view of the fact that it doesn't go into effect until October 1, 1916, steps will be taken to appeal at least those portions of it which on its face appear to be impracticable.—Editors.]

Over 600 head of beef cattle were shipped to various San Francisco firms of wholesale butchers from Alton, Humboldt county, last week. The opening of railway communication with the northern coast counties is having a very beneficent influence on the stock industries up there.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

DAIRY CATTLE.

REG. HOLSTEINS—We offer choice grandsons of King Segis, also grandsons of the world's record cow. Creamelle Vale; blood that increases the value of your herd. Write or call and see our herd. F. H. Stenzel, San Lorenzo, Cal.

SUNNYBROOK RANCH, WILLITS, CAL.—Breeders Registered Holstein stock. Young bulls for sale ready for service. Sired by De Kol Fobes Homestead 6th. Prices reasonable.

REGISTERED HOLSTEINS—Young bulls sired by King of Riverside and Lakeside Model Prince from A. R. O. dame. J. H. Harlan Co., Woodland.

FIVE REGISTERED HOLSTEIN cows and four heifers priced for quick sale. K. W. Abbott, Milpitas, Cal.

HOLSTEIN BULLS—Pure-bred young Holstein bulls for sale on Thompson Ranch, near Napa. For prices and particulars, address J. B. Agee, Napa, Cal.

FOR SALE—60 Jersey heifers, $30 each. 55 Jersey cows and 4-unit Sharples milker and separator, $5000. Terms. C. B. Crawford, Buttonwillow, Cal.

FOR SALE—About 60 head of fine dairy heifers from 6 months to 2½ years old. Grade Jersey and Holstein. I. S. Smith, 226 Alameda Ave., San Jose, Cal.

FRANK MEACHAM, Petaluma, California.—Breeder Red Polled cattle, both sexes. Take electric cars at Santa Rosa or Petaluma for Live Oak.

CALVES RAISED WITHOUT MILK—Cost less than half as much as the milk-raised calves. Write for free book to COULSON CO., Petaluma.

AYRSHIRES—For sale, fine young bulls from Imported dams and sires. E. B. McFarland, 412 Claus Spreckels Bldg., San Francisco.

REG. GUERNSEY BULLS for sale. Grapewild Farm, Mayhews, Sacramento county, Cal. A. B. Humphrey, Prop., P. O. Box P.

THE McCLOUD RIVER LUMBER CO., McCloud, Cal.—High-class, thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

SWINE.

I HAVE ANOTHER CROP of seventy-five head of Big Type Poland China Boars, born in February, sired by Iowa Wonder, who is a son of A Wonder, the Greatest Poland China Boar, Living or Dead. Iowa Wonder is in the 1000 lbs. class. One of his sons from one of my good registered sows should make you money. I will sell the best first. On account of being overstocked will sell them at $20 each while they last, but they will not last long at this price, so act quick if you want an extra good boar for little money. Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD of pedigreed O. I. C. Swine; weaned pigs of both sexes ready for immediate shipment; pairs and trios mated, not akin. All from big type stock of extra heavy bone. Immunized against hog cholera, crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

BLUE-RIBBON HERD DUROC-JERSEY HOGS—Bred Gilts a specialty. 15 bred now. 20 ready to breed. Sires and dams win all blue ribbons 1912, 1913, 1914 State fairs. 15 first, 13 seconds, 6 thirds, 7 fourths, 1 fifth. Will show 1915. For prices, write John P. Daggs, Modesto, Cal.

BERKSHIRES—Headed by Bandmaster 2nd, junior champion Iowa State Fair. My females were winners at Iowa, Wisconsin and Minnesota State Fairs. Farm at San Mateo. Address W. M. Caruthers, 218 Hearst Bldg., San Francisco.

BLATCHFORD'S PIG MEAL weans easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

REGISTERED, PUREBRED BERKSHIRE PIGS—(Weanlings) both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

FAIR OAKS RANCH, WILLITS, CAL.—Registered Duroc and Berkshire Swine. Weanlings for sale.

BARGAINS—Two fine Duroc-Jersey Boars for sale at half their value. "Jim" No. 4 from R. D. Beauty No. 122721. Also Chief No. 54 from Red Wonder 97295 One and two years old. Western Hog and Land Syndicate, 919 Hearst Bldg., San Francisco.

BARGAINS—Big type Duroc-Jersey sows at great bargain. Will farrow in September by thoroughbred boar. Cholera immune. Make 100 per cent by buying one or more of these sows now. Western Hog and Land Syndicate, Inc., 919 Hearst Bldg., San Francisco.

REG. BERKSHIRES—Fine 3 months old pigs, both sexes, by Panama Lee, Gold Medal Winner at 1914 State Fair. Also bred sows. C. E. Barrows, Los Molinos, Cal.

REGISTERED BERKSHIRE SWINE—All ages, for sale. Grapewild Farm, Mayhews, Sacramento, Cal. A. B. Humphrey, Prop., P. O. Box P.

TAMWORTH BOARS—Registered 2-12 months old, large and rangy. Weanlings both sexes $10 each. Fine healthy lot. L. J. Archer, R. F. D., Antioch, Cal.

25 POLAND CHINA SPRING BOARS—Jan., Feb., March farrow. Prices, registered and crated, $20, $15, $10. Edwd. A. Hall, Watsonville, Cal.

DEL DAYO FARM—(Old Haggin Bottom Ranch)—Breeders of Registered Berkshires, both sexes for sale, P. O. Box 1140, Sacramento, Cal.

PLAINFIELD STOCK FARM—Registered Berkshires and Durocs. Young stock for sale, both sexes. H. M. Bullard, Woodland, Cal.

REGISTERED BERKSHIRE SOWS and their weanlings. Quality, health and vigor. Boars, all ages. F. H. Wilson, Turlock, Cal.

GLENVIEW POLAND-CHINAS—Baby pigs from best families for sale. From $15 up. Chas. B. Hanna, R. 3, Riverside, Cal.

IMPERIAL STOCK FARM BERKSHIRES—Quality and price guaranteed to satisfy. R. J. Merrill & Son, Morgan Hill, Cal.

REGISTERED BERKSHIRES — Weanling hoar pigs. $10.00 each. A few older hoars. J. M. Bomberger, Modesto, Cal.

LINDEN STOCK FARM—Registered Berkshires, both sexes, all ages, best of breeding. Write for prices, Linden, Cal.

REGISTERED POLAND-CHINA SWINE—Prize winners. Finest stock in the State. $20 up. M. Bassett, Hanford.

REGISTERED O. I. C. BOAR—17 months old. Good stock. $35. Also two O. I. C. bred sows. H. Witts, Turlock.

REGISTERED DUROC-JERSEYS from Eastern sows. Six months gilts and hoars. S. S. Southworth, Napa, Cal.

BERKSHIRES—Pedigreed Boars ready for service. Also pedigreed weanlings. C. H. Thompson, Novato, Cal.

Veterinary Queries and Replies.

[Answered by Dr. H. R. Wintringham, Petaluma, Cal.]

CALF AND PIG TROUBLES.

To the Editor: Young calves from 6 to 8 months old appear to be in healthy condition, feeding on alfalfa, passing blood in their uriue. What is the cause and remedy?

Brood sows, running on alfalfa, in good condition, farrow with good litters, pigs in good shape. Sows are fed alfalfa pasture and milk (separated); the little pigs get uice and fat, then in about two weeks they become scabby, sores forming, and finally die. I have kept litters from mudholes.—H. A. G., Tolleson, Arizona.

[The calves are getting too much alfalfa. Let down on this and substitute millfeeds for a time.

The pigs have infectious dermatitis. Dip them every other day in a two-per-cent solution of Liquor Cresolis Compositus. Disinfect their quarters with the same strength solution.

INFLAMMATION OF KIDNEYS.

To the Editor: What is the matter with a pig that urinates almost constantly, usually small stream. At first uatural in appearance; uow, after five days, considerable quantities of blood, bright-red. The pig lies down on his belly most of the time. When standing, back is humped. Age about one year. Can anything be done? No others seem affected. Does not cry as if in pain, but lies very quiet.—P. R. A., Turlock.

[This is inflammation of the kidneys. The best remedy is to butcher the animal. You might try giving flaxseed tea twice daily in one piut doses, also one drachm potassium citrate twice daily.

UDDER TROUBLE.

To the Editor: I have a heifer that has been fresh about 2 months. She has been giving about 2 gallons per milking. Within three days she dropped down to about a quart per milking. One teat does not give any at all—only blood. She eats, drinks, chews her cud, and seems all right except a little stiff. Can I do anything for her?—D. W. N., Wheatland.

[Apply camphorated oil to the udder and rub in thoroughly twice a day. Give internally two drachm doses potassium iodide dissolved in water twice a day for two weeks.]

NON-BREEDING SOW.

To the Editor: My sow is four years old, and raised several nice litters. The last time she took the boar was January 28, 1915, but it did not bring her with pigs, and since that date she has never been in heat. She is fat, and seems to feel good.—J. P. T., Roseville.

[Give the sow the following: Fluid extract viburnum prunifolium in two-drachm doses twice a day.]

HORSE WITH STOMACH TROUBLE

To the Editor: We have a horse that every year about this time (aud sometimes in June) acts as if she had the colic, but it is not. Some people tell me it is "bots." As soon as it gets to be very warm weather she starts in. She will drop right down in her tracks and begin to roll, just as if she had colic. She will go in the creek and lie right in the water, which is about three feet deep, and stay right there for awhile. We can not do any work while she is in this state.——P. C. B., Sonoma.

[Put this horse on Fowler's solution of arsenic in one-half ounce doses three times a day for one month. Externally apply the following once every ten days for three applications: Powdered sulphur, 2 oz., oil tar, 2 oz.; oil cajuput, 2 oz.; neutral oil enough to make oue quart.]

RING WORM.

To the Editor: I have a cow which has been licking her nose more than usual. On examining, I find that she has little brown rings all over her nose resembling riug worms. The cow is in fine condition. I also have a sorrel horse which has sores all over his body, especially on the head. They are under the skiu, and rise up in lumps aud come off in scabs, bringing hair and skin with them. They average about an inch or more in diameter.—L. T. B., Angels.

[Both your cow and horse have ring worm. Paint the diseased spots every day with tincture of iodine as long as there is evidence of the trouble spreading.]

PROBABLY LOCKJAW.

To the Editor: My neighbor has two horses afflicted in the hind legs, which seem stiff and sore; next they seem weak in the couplin and stiff in the neck. Two days later both were down perfectly helpless; lay and lashed with their fore feet. They neither eat nor drink. Please give us treatment, and is it contagious?—G. H. C., Canby.

[The trouble is more than likely lock jaw, and the animals are very probably dead by this time. This is not a contagious disease.]

SOMETHING FOR YOUR GREAT-GRANDCHILDREN.

The United States Forest Service has just completed a study of the rate of growth of yellow pine upou cut-over lands upon the Tahoe, Stanislaus, Sierra and Sequoia National Forests. Figures obtained show that an excellent stand of timber will result in the best localities in the western Sierras in 50 to 60 years. This study indicates that the following yields will be derived from fully stocked stands:

47,500 board feet at 50 years of age.

61,400 board feet at 60 years of age.

70,000 board feet at 70 years of age.

The yield of cordwood from these same stands will be 92 cords per acre at 50 years, 112 cords at 60 years, and 123 cords per acre at 70 years. If the timber is utilized for mining or as telephone or power poles, large yields are indicated.

Quite a colony of Italian dairymen are settling in Glenn County.

"Increases the Milk Flow Strengthens & Improves the Physical Condition of the Cow"

That's what A. W. Morris & Sons (breeders of the new world's champion milk producer, Tilly Alcartra) say about Dried Beet Pulp.
Read this letter:—

Woodland, Cal., May 13, 1915.
"The Larrowe Milling Co.,
Gentlemen:—
Having fed Dried Beet Pulp for the past four years in the official testing of our herd of registered Holstein-Friesian cattle we feel that we are in position to judge of its value as a dairy feed. We can now say without hesitancy that it is one of the best and most economical dairy feeds in the market, and for the dairyman in the alfalfa districts it is invaluable as a supplement to alfalfa.
Dried Beet Pulp fed with alfalfa will not only increase milk production, but it will materially strengthen and improve the physical condition of the cow, which enables her to maintain this milk flow, produce better offspring, and prolongs her period of usefulness. In feeding for maximum production we find Beet Pulp quite a necessity, as it has the effect to lighten the ration and tends to offset any injury which might arise from heavy feeding. We also find it valuable for growing calves.
(Signed) A. W. MORRIS & SONS CORPORATION
By F. L. Morris."

IF YOU are in doubt about the value of Larrowe's Dried Beet Pulp for feeding to your cattle, we suggest that you get a single 100-lb. sack from your dealer and test it on one cow whose milk record you know. It may be had either plain or with molasses. Ask your dealer for LARROWE'S.

Feeding Instructions Free

GRANDSONS OF TILLY ALCARTRA
At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

Mules Co-operate in Harvesting.

All hail to the mule! Twenty-eight of him, weighing 1300 to 1600 pounds, leaned into the collar as a unit under the gentle urging of the skillful driver and the big combined harvester started its half day round on the farm of N. C. Anderson in the Montezuma hills. Two lines to the four lead mules were sufficient to govern the whole bunch so efficiently that the harvester sickle bar took a full swath and no more. Around the steep hillside swung the regiment of mules at a slow, steady gait with the threshing machine behind them, across a gulley and along the next hillside, and another, and another, shelling out the golden grain in gratifying piles of sacks and dumping the straw in small bunches for future use.

It was the ingenious evener used on the machine which made the beautiful start of the mules possible, according to one man who works for Mr. Anderson. When the four leaders leaned into the collar at the command of the driver perched high in air far behind them, they pulled the eveners back on the four sets of six mules each, behind the leaders, so that not one of them could avoid working, nor could any of them well work at all unless the leaders were pulling.

But Mr. Anderson gives much of the credit to the driver of the mules and much credit to the mules themselves and their training.

"This is probably the best bunch of mules in this country; there isn't a lazy one among them," says he. "They are bred from Percheron and Shire mares; they are steady and careful; are not excitable, and they have a more uniform gait for all in the bunch; they stand the heat much better than horses."

Another strong advantage pointed out by Mr. Anderson is that in the hills they ordinarily need only 20 or 30 h.p. to run a combined harvester, but occasionally they want to get over a hill where much more power is necessary. All that is necessary is to rest the mules a little bit; give them a start, and they will exert the extra power necessary to take the machine over the hill, when they may rest again if necessary.

GROWTH OF SORGHUMS VARIES.

[Written for Pacific Rural Press.]

On the University Farm is a great stretch of field planted in strips 3 to 6 rows wide, of a dozen or more different kinds of sorghums unirrigated. There is great contrast between the varieties, though most all of them have extra heavy leafage from the ground up.

The kowliang was fully 8 feet tall July 23, but the lower leaves were mostly dead. Feterita averaged 6 feet tall with large, loose, erect heads just shedding their pollen. Dwarf milo, four feet tall had very few heads showing, but a tremendous amount of leafage. White and brown durra was fully headed and about 6 feet tall. Buff durra was 6 feet tall, but not headed out. Pink kaffir 3 feet high, not headed out, had the heaviest leafage of all. White kaffir was fully headed out four feet tall with some of the grain hardened, while some of it was just shedding its pollen. Standard milo was 5 feet tall with heads just peeping out. Shallu looked a great deal like the dwarf milo, being over 4 feet tall and having few heads showing. Indian corn in a field across the road averaged about 10 feet tall with the ears well silked out, about shoulder high and heavy leafage of beautiful dark green. This was drilled close together in rows the usual distance apart, in order to restrict the size of the stalks for silage.

RED-WATER IN CATTLE.

To the Editor: Some time ago I asked the Pacific Rural Press about a cattle disease called "red-water," which is present more or less all the time in this part of the country, and you answered that "red-water" is another name for Texas fever, adding that Washington is free from this disease. I have always believed so myself, and I have never heard of any cattle ticks being found either here or in Oregon. The description of the symptoms that I read in veterinary and farm books does not fit the case. The absolutely only characteristic noticeable in the disease, as it appears to me, is bloody urine. The animal has as good appetite as ever, and does not lose flesh until it has been suffering for a long time, or has had two or three attacks of the disease. It takes a long time before the animal succumbs. I have just met a neighbor who tells me that he has killed one bull and one cow this summer on account of this mysterious red-water malady. The bull was a fine, registered Jersey bull, 5 or 6 years old. He noticed the red-water for fully three months before he decided to butcher the animal. The bull was not sick, did not lose any flesh, and did not seem to suffer. The only organ that showed any change was the bladder, which was "thick as my thumb," to use his own expression. The farmers here consider the disease as a purely local affection with no effect whatever upon the rest of the body. The meat is considered perfectly healthy. But as the disease has a tendency to attack the animal time and again, and ultimately kill it, we are anxious to find out what it really is, and what the cause may be, whether it is some poisonous herb or something else, and also if there is any cure for it. Could you enlighten us on this subject?—Ernst Skarstedt, East Sound, Wash.

[This is a true Haematuria, rarely found as a specific disease, but usually as a symptom of other disease. It is peculiar to some localities, particularly in those sections which have low, damp, sour soils, and where all the feed is taken and used from such soils. It is also found in woodlands. The best remedy for the trouble is to cut out as far as possible the feeds grown on these soils and to substitute feeds grown elsewhere. The feeding of flaxseed tea in quart doses two or three times a day is very beneficial, but the main treatment is the change to feed grown on sweet soils. In advanced cases give potassium acetate in one-ounce doses twice a day. It is undoubtedly due to some mysterious toxin unknown at present, and contained in forage grown on the above described soils, which is released after simple ingestion, causing the destruction of some of the red blood corpuscles and a release of haematin contained in them, which is excreted by the kidneys; also it causes rupture of the vesicles of the bladder due to its irritation.]

To the owner of the cow showing the greatest production of butter fat for the 2 months beginning October 1 a cup has been offered by the Business Men's Ass'n. of Chico.

HORSE OWNERS! USE

GOMBAULT'S

Stanford University, California.

With the Live Stock Men.

The Cow Testing Association recently formed at Arcata, Humboldt county, is meeting with gratifying success. Over 1200 cows or 30 per cent of the total in the district are now represented.

Rio Vista will hold a horse show on Admission Day, September 9th. The Show Committee contains the names of several well-known horse breeders, including E. W. Westgate, Daniel McCormack and Dr. Hanna.

An exchange says that an Illinois buyer who has been over the southwest pretty thoroughly, states that Arizona and California breeders are buying heavily of yearling ewes in New Mexico for breeding purposes, paying fancy prices.

With two carloads of horses and mules shipped from Merced the other day, practically all the stock of that district for sale to European governments for war purposes is cleaned up and the buyers have left for other parts.

State Dairy Inspector Sam Watson has found a number of instances in Sonoma county where cream separators are not properly cleansed after use and warns the dairymen that the law requires the sterilization of dairy appliances after use.

An outbreak of glanders is reported among a bunch of mules being used hauling grain in the Tulare Lake district of Kings county. The County Veterinarian was promptly on the spot, destroyed one animal and has the rest quarantined and under observation.

Col. Ben Rhoades will officiate as auctioneer at the consignment sale of Holstein cattle to be held at Hanford on October 14th and J. W. McAlister of Chino will act as sales manager. Such well-known breeders as R. F. Guerin of Tulare and Hewitt & Hewitt of Hardwick will offer animals at the sale.

The July report of the San Joaquin County Dairymen's Association shows 21 cows producing an average of 45 lbs. of butter-fat for the month. Of this number B. A. Goodwin of Ripon has three, all grade Holsteins. His herd of 40 cows is second in average in the county. He has an average of 29.9 lbs. butterfat.

There will be a notable consignment auction sale of high-class Holstein cattle held at Sacramento on October 6th, when McAlister & Son of Chino and A. W. Morris & Sons of Woodland will offer many of the best individuals of their respective herds. Watch our advertising columns for the announcement of this important sale.

Cow Testing will begin this week east of Mesa, Arizona. M. C. Tucker, tester, has been distributing milk scales and sample bottles lately. He has now succeeded in getting a $4 milk scale for the ranchers at $2.50 by ordering enough for all of them and agreeing to stand the freight back to the factory on all that were not disposed of.

Among the Berkshires to be shown at the Panama-Pacific this fall are several from the herd of F. W. White of Elk Grove, who won 14 prizes on the nine head shown last year at the State Fair. Robins Ruby, now four-year-old champion, sow last year, is one; Columbia's Model 28th and her daughter Columbia's Model 40th are others; a grandson and a great grandson of the St. Louis World's Fair World's Champion Premier Longfellow.

An eastern publication describes a novel way of making a sick hog take its medicine. The owner cut some slits in the toe of an old shoe and while another man held the animal, stuck the shoe in its mouth. The pig squealed, chewed the shoe viciously, and when the medicine was poured into it, swallowed it as if drinking from a trough. In three days the hog was well. A trick well worth knowing—if one knows what ails the pig.

New Zealand is soon to have a large flock of prize sheep on display in the live stock division of the exposition. They are for the express purpose of giving the sheepmen of America an idea of the character of sheep raised in that province. More than 100 of the following breeds have been collected for shipment: Romney Marsh, Corridale, Lincoln, Border Leicester, English Leicester and Down. Last year New Zealand raised 25,000,000 sheep and exported about 7,000,000 dressed.

Prof. A. M. McOmie, Agriculturist in charge of the Experiment Station north of Phoenix, has proven that sheep pastured on Johnson Grass will practically exterminate it in two years. The proper management of pasture should be to grow a crop and turn on enough stock to eat it in about a week and then get them off the ground and let it grow again. Alfalfa can be pastured under this system as long as a field should be allowed to stand in any one crop.

The Umatilla County branch of the Oregon State Horsebreeders' Association will hold its first annual horse and mule-show at Pendleton on October 9. As no fee will be charged for entries of horses or mules and the exhibitors will be allowed free feed for their stock and free admission for themselves and grooms, it is expected that there will be a large number of animals shown. Members of the O. A. C. livestock division will be the judges.

The Berkshire view herd at the P. P. I. E. grounds has been somewhat changed since the first of the month by the addition of 14 head from Brookwood Farms, Ames, Iowa. This was a portion of a carload which were shipped, the balance of the shipment being distributed as follows: 31 head to Thatcher and Ennis, Riverside county, two to Frank Brush, Sonoma county, one to F. R. Steele of Oregon and one to H Hewens of Napa county.

The eastern consignment of Shorthorn cattle for the Shorthorn view herd at the Exposition grounds arrived the first of this month and have been stabled in the barn which also contains the Berkshire swine view herd. There are 12 head altogether, five bulls and five heifers from five states in the east and two head from the Hopland Stock Farm at Hopland. The herd will be maintained till the opening of the livestock show in October.

Nothing detracts more from the appearance of a horse than a scraggly mane or a bobbed tail. This unsightliness may often be avoided by care in grooming. The mane and tail should always be combed gently and carefully.

If either becomes badly tangled take some oil—automobile cylinder oil of a good grade will serve the purpose—and pour on the mane or tail and work it in with the fingers until the whole of the tangled mass is thoroughly wet. Then, using a mane comb, begin at the edge of the tangle and pick out a few hairs at a time. The hairs will slip over one another easily, and with the exercise of some care the worst tangle may be removed.

The Guernsey cow Imp. Violet IV of Corbinez 32405 A. R. 1780, sired by Imp. The Conqueror II, 15323 A. R., who is a son of Governor of the Chene 1297 P. S., and out of Imp. Primrose of the Gree 28518, has just finished a yearly record of 16,336.4 pounds of milk containing 756.72 pounds of butter fat. She freshened March 4, 1914, and was started on test four days later. This record adds another honor to the already long list gained by Governor of the Chene 1297 P. S. and his progeny.

The total live stock in California December 31, 1914, as reported by State Statistician Geo. Robertson in the State Board of Agriculture's report just issued, is as follows: horses 503,000, an increase of 5,000 over the year previous (the war demand has greatly decreased this total since then); mules, 74,000, an increase of 1000; milk-cows 541,000, an increase of 26,000; other cattle 1,480,000, an increase of 70,000; sheep 2,500,000, a decrease of 51,000; and hogs 877,000, an increase of 80,000. Some of these increases are due to movements from Mexico on account of revolution troubles.

Systematic campaigns of State Veterinarian Chas. Keane's office against sheep scab and Texas fever have practically eradicated them from California. There was recently a serious outbreak of Texas fever in Madera county and sheep scab in the Mendocino-Lake-Sonoma region. Work on these delayed the similar systematic state-wide campaign against hog cholera which Dr. Keane hopes to have in operation within 6 or 7 weeks. Co-operation of county supervisors is hoped for on a plan, the details of which are not yet perfected. Swine breeders' associations will be depended on. Probable one of the main features of the program will be disinfection as thorough as possible wherever cholera hogs have been, with some one of the coal tar disinfectants, such as liquor cresolis, which are effective but harmless to the hogs. A 3 per cent solution of the liquor cresolis is now recommended by the State Veterinarian for disinfection of the ground and premises, while 2 per cent is strong enough to use on the hogs.

BREEDERS SHOULD FILE APPLICATIONS.

All livestock breeders who expect to compete for prizes at the Exposition this fall should remember the dates on which entries for the various divisions close, as entries received after the closing dates will not be accepted. For the benefit of those who have not already received the final classification the following dates are again printed: Entries for horses, mules and asses close September 1; for beef cattle September 15; for dairy cattle September 15; for swine, sheep and goats, October 1; for poultry and pigeons October 15, and for carload lots of cattle, sheep and swine October 10. Each exhibitor should write to the Livestock Department, P. P. I. E. Grounds, for prize list, rules and regulations and application blanks. None of the herds containing animals which were infected with foot and mouth disease will be permitted to enter the State, thus insuring local herds and flocks against possible infection.

From present indications eastern

Oak Grove BERKSHIRES
CHOLERA IMMUNE.
Our herd is Cholera Immune, the only Immune Berkshire herd in the State.
Five herd boars in use and they are second to none on the coast. Our sows are of equal merit.
We have at present some 300 Berkshires and we know that we can supply what you want.

F. F. SMITH & CO. - Sacramento, Cal.

breeders will make a large showing at the Exposition in October and November. A representative of the American Shorthorn Breeders' Ass'n is authority for the statement that a special train will be made up at Kansas City for exhibitors of that breed and that keen competition may be expected in all classes as the stock will come direct from the Kansas City Royal Show. Hood Farm of Springfield, Mass., will be a competitor in both the Jersey cattle and Berkshire swine classes, and Mr. Gentry of Illinois will very probably be a Berkshire competitor. D. O. Lively states that entry applications are arriving in amazing numbers and that there is no doubt of the success of the show, now that the foot and mouth quarantine has been raised.

Some of our subscribers may remember a front page description of the "certified dairy" of H. R. Timm of Dixon, published some four years ago. Mr. Timm started with 15 cows, but now has 250, and has just completed what is said to be the largest dairy barn in the state. It is 208 feet long, 60 feet wide, and 26 feet at the peak, and cost $10,000. The entire floor and sides are concrete. There are 300 swinging windows, and the ceiling is tightly sealed, making the stable practically dust proof and perfectly ventilated. The dairy now ships out 3000 quart bottles of certified milk daily, the growth of the business being calculated at 1200 per cent in six years.

AGRICULTURAL REVIEW.

(Continued from page 151.)

prevent its shipment across the continent.

Butte county supervisors have voted to institute a county-wide campain against the yellow star thistle. The county hortcultural commissioner is instructed to serve notice immediately on property owners whose lands are infested. There has been much contention over this weed campaign.

With several hundred acres coming into bearing, and all of the older trees breaking down under the weight of a heavy yield, the peach crop in Sutter county this year is larger and of better quality than at any time in the history of the county. Local growers believe that the peach crop from this county this year will exceed that of every other county in the State. Although the price for peaches this year ranges from only $7 to $12 a ton, and in a few cases $20 to $25, where contracts had been made previously, as against $27.50 to $32 per ton last season, growers feel confident that the slump will not continue over another season.

GRAIN AND FIELD CROPS.

Five thousand sacks of rice were delivered to the Gridley Rice Milling Company by the Moulton ranch last week.

Notwithstanding some damage suffered from worms and hoppers, the bean growers of Colusa county anticipate a good yield.

Farm Adviser Lyons has had so many calls for his services that it has been found necessary to provide him with an assistant.

The United States Crop Reporting Bureau estimates the condition of the cotton crop on July 25th as 75.3 of normal.

The Oakdale district of Stanislaus county is finding sugar beets a good crop and the 300 acres planted will be considerably increased.

With the stiffening price for alfalfa, a Hanford paper estimates that the crop of Kings county will realize $2,500,000 for the growers this season.

The hop crop of Sonoma county is well forward this year, the recent weather having been most favorable. Picking will commence in about ten days.

A report from Sutter county gives the growth of Soudan Grass as over eight feet from the time the seed was put in the ground seven weeks before.

The total carload shipments of melons from Brawley, Imperial Valley, has already exceeded those of last year with much more yet to be shipped.

Folki, a Chinese variety of string bean, is reported to thrive in sections of Yuba county and find a ready sale in the San Francisco market at 40c to 50c a pound.

L. P. Denny of Summit Lake district, Fresno county, reports the wheat crop in that section as turning out very heavy. Some of it grew so rank that it lodged very badly.

Horticultural Commissioner Beers of Santa Barbara reports a greatly increased acreage of beans in his county, and, expecting an increase foreign demand, predicts a profitable year for the growers.

An energetic campaign is being made to secure members for the California Ripe Olive Association in the Oroville district of Butte county, where it is hoped to enroll anywhere from 100 to 150 members.

Owing to favorable weather conditions, Butte county rice growers estimate they will harvest a crop of ninety per cent of normal this year. It is said there are now 20,000 acres planted to rice in Butte county.

Esparto, Yolo county, will hold an "Almond Festival" on September 4th. This is said to be the first almond show ever held in the United States, but aside from the almond feature, there will be a display of stock and another of babies.

Fallon, Nevada, papers announce that a State Fair will be held in that city about the end of September, admitting at the same time, however, that some opposition exists against the scheme in Reno, but which Fallon expects to overcome.

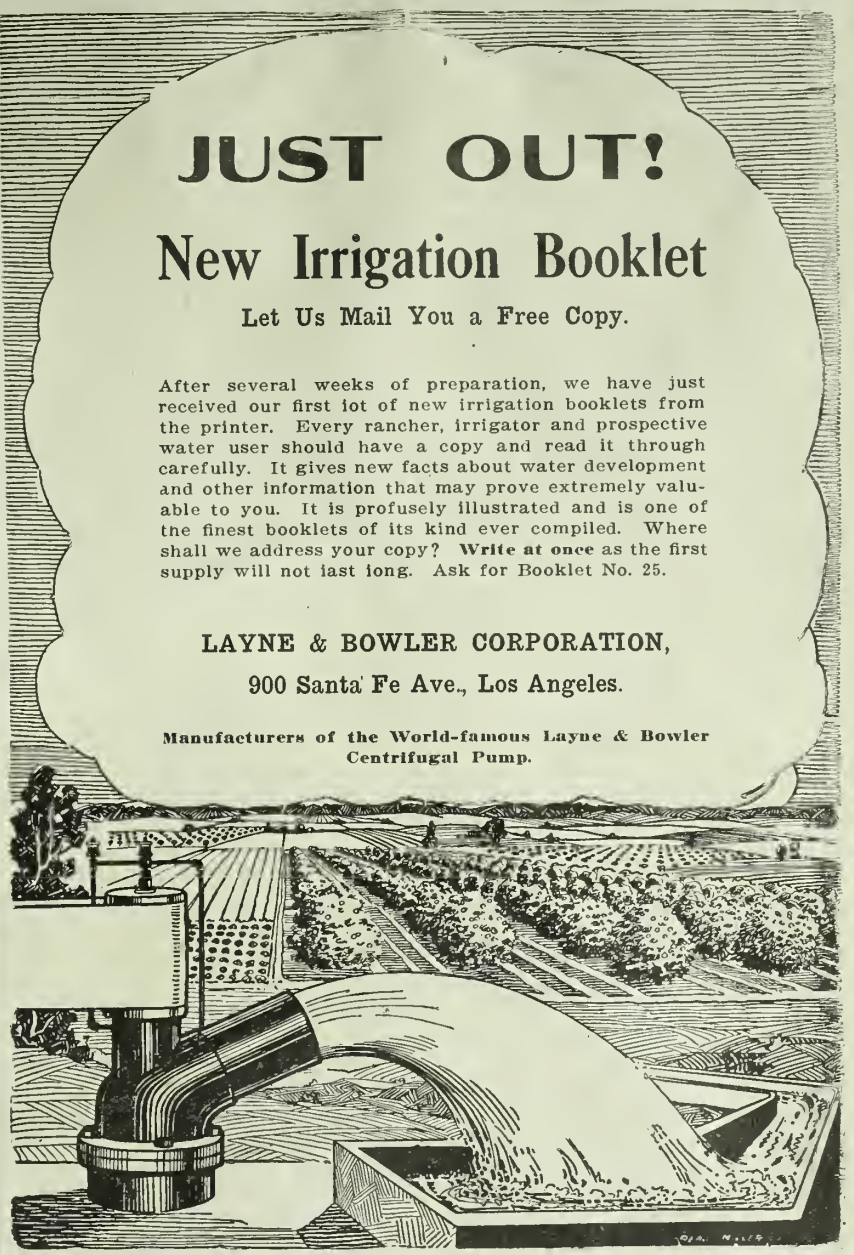
Hay is gaining in price steadily. The heavy export demand and the plowing under of many alfalfa fields has caused the lowering of stocks and the supply to such an extent that the price promises to advance very materially over the figures offered early in the season.

In the section around Manteca, San Joaquin county, there has been planted this year a large acreage of sunflowers. The yield is estimated will be 300,000 pounds of seed, which will be sent to Los Angeles and made into oil and the residue fed to stock.

Hop picking in the Sacramento valley will commence next week and in the Sonoma fields about the 25th. Prospects are good for a yield all along the coast of 10 per cent larger than last year. Prices are very fair. as the market has been advancing for several weeks. Hop pickers will be paid one cent per pound this year.

JUST OUT!

New Irrigation Booklet



Let Us Mail You a Free Copy.

After several weeks of preparation, we have just received our first lot of new irrigation booklets from the printer. Every rancher, irrigator and prospective water user should have a copy and read it through carefully. It gives new facts about water development and other information that may prove extremely valuable to you. It is profusely illustrated and is one of the finest booklets of its kind ever compiled. Where shall we address your copy? **Write at once** as the first supply will not last long. Ask for Booklet No. 25.

The Home Circle.

KITTY WISDOM.

By Oliver Penmark.

Pray tell me, Pussy Kitty,
Tell me, will you not,
Why you always curl up snug
On the only sunny spot?

Pussy, mewsing, answered,
'I choose the sunny spot
Because I think it wiser;
Now tell me, dear, why not?

"Perhaps as you grow older,
And wiser, too, you'll not
Fail to make the most, dear,
Of every sunny spot!"

A VISIT TO THE OLD HOME.

"Hello, Jim, where've you been lately?" shouted a broker the other evening to a portly, finely dressed man in the corridor of the Palmer House. The gentleman stooped, shook hands with his friend, and replied: "I've been home to see my old father and mother, for the first time in sixteen years, and I tell you, old man, I wouldn't have missed one day of that visit for all my whole fortune."

"Kind of good to visit your boyhood home, eh?"

"You bet! Sit down. I was just thinking about the old folks and feel talkative. If you have a few minutes to spare sit down, light a cigar, and listen to the story of a man, who in the chase for wealth, had almost forgotten his father and mother."

They sat down and the man told his story.

"How I happened to visit my home happened in a curious way. Six weeks ago I went away duck hunting. I had a lunch put up for me, and you can imagine my astonishment when I opened the hamper to find a package of crackers wrapped up in a piece of the little patent inside, country weekly paper published at my old home in Wisconsin. I read every word of it, advertisements and all. There was George Billings, who was a schoolmate of mine, advertising ham and salt pork, and another boy was postmaster. By George! It made me homesick, and I determined then and there to go home and go home I did.

"In the first place, I must tell you how I came to Chicago. I had a tiff with my father and left home. I finally turned up in Chicago with a dollar in my pocket. I got a job running a freight elevator in the very house in which I am now a partner. My haste to get rich drove the thoughts of my parents from me, and when I think of them, the hard words that my parent last said to me, rankled in my bosom. Well, I went home. I tell you, John, my train seemed to creep. I was actually worse than a schoolboy going home for a vacation. Familiar sights met my eyes, and upon my word they filled them with tears. There was Bill Scott's red barn, just the same, but, Great Scott! what were all the other houses? We rode nearly a mile before coming up to the station, passing many houses of which only an occasional one was familiar. The town had grown to ten times its size when I knew it. The train stopped and I jumped off. Not a face in sight that I knew, and I started down the platform to go home. In the office door stood the station agent. I walked up and said: 'How'dy, Mr. Collins?" He stared at me and replied: 'You've got the best on me, sir.' I told him who I was and what I had been doing in Chicago, and he didn't make any bones in talking to me. Said he: 'It's about time you came home; you in Chicago, rich, and your father scratching gravel to get a bare living!' I tell you, John, it knocked me all in a heap. I thought my father had enough to live comfortably. Then a notion struck me. Before going home I telegraphed to Chicago to send me $1,000 by first mail. Then I got into Mr. Collins' back office, got my trunk in there, and put on an old hand-me-down suit that I used for hunting and fishing. My plug hat I replaced by a soft white one, took my valise in my hand and went home. Somehow the place didn't look right. The currant bushes had been dug up from the front yard, and the fence was gone. The house looked smaller somehow, too. But I went up to the door and rang the bell. Mother came to the door and said: 'We don't wish to buy anything today, sir.'

"It didn't take me a minute to survey her from head to foot. Neatly dressed, John, but a patch and a darn here and there, her hair streaked with grey, her face thin, drawn and wrinkled. Yet over her spectacles shone those good, benevolent, honest eyes. I stood staring at her and then she began to stare at me. I saw the blood rush to her face, and with a great sob she threw herself upon me and nervously clasped me about the neck, hysterically crying: 'It's Jimmy, it's Jimmy!'

"Then I cried, too; John, I just broke down and cried like a baby. She got me into the house, hugging and kissing me, and then she went to the back door and shouted, 'George!'

"Father called from the depths of the kitchen, 'What do want, Car'line?'

"Then he came in. He knew me in a moment. He stuck out his hand and grasped mine and said, sternly: 'Well, young man, do you promise to behave yourself now?' He tried to put on a brave front, but he broke down. There we three sat like whipped school children, all whimpering. At last supper time came and mother went out to prepare it. I went into the kitchen with her.

" 'Where do you live?' she asked.

" 'In Chicago,' I replied.

" 'What are you working at now, Jimmy?'

" 'I'm working in a dry-goods store.'

" 'Then I suppose you don't live very high, for I hear of city clerks who don't make enough to keep body and soul together. So I tell you, Jimmy, we've nothing but roast spareribs for supper. We haven't any money now, Jimmy, we're poorer than Job's turkey.'

"I told her I would be delighted with the spareribs, and to tell the truth, John, I haven't eaten a meal in Chicago that tasted as good as those crisp, roasted spareribs did. I spent the evening playing checkers with father, while mother sat by telling me all about their misfortunes, from old white Molly getting drowned in the pond, to father's signing a note for a friend and having to mortgage the place to pay it. The mortgage was due inside of a week and not a cent to meet it with, just $800. She supposed they would be turned out of house and home, but in my mind I supposed they wouldn't. At last nine o'clock came and father said: 'Jim, go out to the barn and

GOODBYE ANTS

No Longer Can You Drive the Good Housewife to Distraction

The pesky little ant—the bane of many a housekeeper's existence—has met his Waterloo at last. No longer can he overrun the pantry and infest the sugar, jam and other foods—to the disgust and mortification of the woman of the house.

The ant is hard to kill, and countless remedies were tried upon him without result. It was a sorry day for the ant family, however, when they started to overrun the candy shop and bakery of an ingenious resident of Los Angeles.

Driven to desperation by the annoyance, this man, after much experimenting, devised a paste whose effect upon ants borders upon the supernatural. Suffice to say, it rid his entire shop of the pest in one day.

This wonderful remedy is now put up for general use under the name of Kellogg's Ant Paste and can be obtained at all modern druggists or grocers. Insist upon Kellogg's, and your ant troubles will be a thing of the past.

see if Kit is all right. Bring in an armful of shingles that are just inside the door and fill up the water pail. Then we'll go to bed and get up early and go fishing.'

"I didn't say a word, but went out to the barn, bedded down the horse, broke up an armful of shingles, pumped up a pail of water, filled the woodbox, and then we all went to bed. Father called me at 4:30 in the morning, and while he was getting a cup of coffee, I skipped over to the depot, cross lots, and got my best bass rod. Father took nothing but a trolling line and a spoon-hook. He rowed the boat with the trolling-line in his mouth, while I stood in the stern with a silver shiner rigged on. Now, John, I never saw a man catch fish as he did. To make a long story short, he caught a bass and five pickerel and I never got a bite.

At noon we went ashore, and father went home while I went to the post-office. I got a letter from Chicago with a check for $1,000 in it. With some trouble I got it cashed, getting paid in $5 and $10 bills, making quite a roll. After that I went visiting among my old school mates for two hours and then went home. The joint was in the oven. Mother had put on her only silk dress and father had donned his Sunday go-to-meeting clothes, none too good, either. This is where I played a joke on the old folks. Mother sat in the kitchen warming the roast. Father was out in the barn, and I had a clear coast. I dumped the sugar out of the old blue bowl, put the $1,000 in it and placed the cover on again. At last supper was ready. Father asked a blessing over it, and he actually trembled when he stuck his knife into the roast.

" 'We haven't had a piece of meat like this in five years, Jim,' he said, and mother put in with, 'And we haven't had any coffee in a year, excepting the times when we went a-visiting!' Then she poured out the coffee and lifted the cover of the sugar-bowl, asking as she did so, 'How many spoonfuls, Jimmy?'

"Then she struck something that wasn't sugar. She picked up the sugar-bowl and peered into it. 'Aha, Master Jimmy, playing your old tricks on your mammy, eh? Well, boys will be boys!'

"Then she gasped for breath; she saw it was money. She looked at me, then at father, and then with trembling fingers drew the great roll of bills out.

"Ha! ha! ha! I can see father now as he stood there, on tiptoe, with his knife in his hand, fork in the other, and his eyes fairly bulging out of his head. But it was too much for mother. She raised her eyes slowly to heaven, as she said slowly: 'Put your trust in the Lord, for He will provide.'

"Then she fainted away. Well, John, there's not much more to tell. We threw water in her face and brought her to, and then we demolished that dinner, mother all the time saying, 'My boy Jimmy! my boy Jimmy!'

"I stayed home a month. I fixed up the place, paid off all the debts, had a good time and came back again to Chicago. I am going to send $50 home every week. I tell you, John, it's mighty nice to have a home."

John was looking steadily at the head of his cane. When he spoke he took Jim by the hand and said: "Jimmy, my friend, what you have told me has affected me greatly. I haven't heard from home way out in Texas for ten years. I'm going home tomorrow."—Western Farmer.

LOGAN AND BLACKBERRY RECEIPTS.

The Sebastopol Berry Growers' Association recently gave prizes for the best recipes for using Loganberries and Mammoth Blackberries. Here are a few of them:

Loganberry Cake Filling.—Beat together until smooth and stiff one cupful sugar, white of one egg, and one cup fresh Loganberries, crushed. This is an attractive and delicious filling used with any good layer cake recipe.

Loganberry Shortcake.—Make a rich biscuit-crust, split, butter, spread both layers, cut side up, with Loganberries crushed with sugar—two cupfuls to the quart of berries. Serve with thick or whipped cream.

Loganberry Jelly.— Wash and drain ripe, fresh berries; pour them in preserving kettle until it reaches two-thirds of the way to the top of the berries; stew until tender, drain over night in a flannel bag which has previously been wrung out of hot water. Do not squeeze—let it drip. In the morning add as much sugar as you have juice. The kettle must not be over half full or it will run over. Boil just twenty minutes, skimming off foam constantly.

Raw Loganberry Jam.—Put three pounds of berries and three pounds of sugar in an earthen or granite dish in the following manner: One layer of berries and one layer of sugar alternately; let stand two hours, and then with a wooden spoon stir thoroughly to blend the mixture. After this stir very thoroughly four times a day for three days. Put in glasses and seal like cold jelly.

Blackberry Jam Cake.—One and one-half cups sugar and three-quarters cup butter beaten to cream, add yolks of five eggs, beat well; one cup buttermilk, three cups flour, one-half cup blackberry jam; cloves, nutmeg, cinnamon to taste; one teaspoon soda, dissolved in warm water and added just before baking. Bake in layers, put together with boiled icing.

Delicious Blackberry Whip.—Two-thirds cup ripe blackberries, one-half cup granulated sugar, white of one egg. Put ingredients in platter and beat steadily until the mixture will stand alone. Serve as a dessert with a few ripe berries on top; or chill and serve as a dainty dessert in sherbert glasses, or use for filling in a layer cake. The whip will keep fresh two or three days in a cool place.

"What made you distrust that Italian refugee? I thought he told a straight story." "It sounded so, but when I questioned him as to his home and occupation he said he was a street-cleaner in Venice."—Baltimore American.

"Willie," said the boy's interested uncle, "I hope you take pains with your lessons in school." "I took pains with 'em today, anyhow," replied the young gentleman. "Unusual pains?" "Yes, sir; unusual pains. Teacher whipped me twice."—Washington Star.

Gas Stove Convenience with Kerosene

Kitchen Economy

With wood or coal—waste heat. Too much or too little for best cooking. In hot weather too much heat coming out into the room.

With a good oil-stove—no waste heat or fuel. One burner or four—low flame or high—a slow fire or a hot one. All the convenience of gas for every home, all the year round.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Better cooking,—flame adjustable to just the degree needed for roasts, for bread, for pastry. No odor. Does not taint the food. A cool cook and a clean kitchen. Ask your dealer. See demonstration, Palace of Manufactures, Panama-Pacific Exposition.

STANDARD OIL COMPANY
(California)
San Francisco

The Markets.

Unless otherwise noted, prices are f. o. b. San Francisco.

San Francisco, August 11, 1915.

WHEAT.

Considerable new crop wheat is coming in, but strictly good milling wheat for prompt delivery is scarce, both here and in other markets. There is accordingly a rather firm feeling, and really first-class stock might hring a premium over the quotation. The new crop here so far shows disappointing quality.

Sonora	$1.77½ @ 1.82½
Cal. Cluh, ctl.	1.80 @ 1.82½
Forty-fold	1.80 @ 1.85
Northern Bluestem.	195 @ 2.00
Northern Cluh	1.80 @ 1.82½
Northern Red	1.75 @ 1.90

BARLEY.

The outlook for supplies for the coming year is not so favorable as it was formerly considered, and prices for both spot and future offerings show a further advance, the speculative market being especially strong.

Shipping	$1.30 @ 1.34
Choice Feed, ctl.	1.25 @ 1.30

OATS.

There is not much activity yet, though the advance in barley is bringing more attention to thls grain. New red oats are coming in fairly well, and there is a good deal of oats mixed with harley, which sells at rather easy prices.

Red Feed	$1.35 @ 1.45
White	1.45 @ 1.50

CORN.

Eastern corn shows some firmness, though not quotahly higher here. Other lines are unchanged, with a falr johhing demand and large offerings of off-grade stock.

California Yellow	$1.80 @ 1.85
Eastern Yellow	1.85 @ 1.90
Milo Maize	1.75 @ 1.80
Manchurian	1.40 @ 1.60
Kaffir	1.80 @ 1.85

BEANS.

The bean situation appears a little uncertain at present. Large handlers are quoting somewhat lower prices for several varieties, yet the market shows an appearance of strength, judged hy prices recently paid for spot supplies in the johhing trade. Small whites, and red kidneys, according to some reports, are especially firm, and the figure on limas has been advanced slightly. In general, however, the new crop is coming on in good shape, with indications of a large crop, and some decline may prohahly be expected as new offerings become avallahle.

(On Wharf.)

Bayos, Cal., per ctl.	$3.50 @ 3.75
Blackeyes	4.00 @ 4.25
Cranherry Beans	3.50 @ 3.75
Horse Beans	1.75 @ 2.00
Small Whites	3.75 @ 3.90
Large Whites	3.50 @ 3.75
Pink	3.00 @ 3.15
Limas	4.15 @ 4.25
Red Kidney	4.90 @ 5.00
Mexican Reds	4.90 @ 5.00

HAY.

Current arrivals continue heavy as for some weeks past, hut the consuming trade is waking up to the fact that the year's supply will not be excessive, and are loading up for the winter; accordingly all arrivals are readily disposed of. and prices on some lines again show a slight advance. Not only has a great deal of hay been shipped to Australia, but a heavy tonnage of alfalfa from the Valley has gone to Europe. Recent country sales show some advance in prices, and with continued export demand the outlook is encouraging for growers. Lltle alfalfa ls coming thls way, and all offerings clean up quickly at good prices.

(On track, San Francisco.)

No. 1 Wheat, per ton	$11.50 @ 12.50
do No. 2	8.50 @ 10.00
Barley	8.00 @ 10.00
Tame Oats	8.00 @ 11.50
Wild Oats	6.00 @ 9.00
Alfalfa	8.00 @ 11.00
Stock Hay	5.00 @ 5.50
Straw, per bale	.25 @ .40

SEEDS.

(Wholesale prices, San Francisco.)

Alfalfa	Nominal
Brown Mustard, per lb.	Nominal
Canary	10 @ 12½c
Hemp	3 @ 3½c
Millet	2½ @ 3 c
Timothy	7½ @ 8 c

FEEDSTUFFS.

Middlings show a slight advance, with some fancy lots held even higher. Rolled barley is also higher, in sympathy with the whole grain, and rolled oats are firmly held.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$20.00 @ 21.00
Alfalfa Meal, ton	14.00 @ 15.00
Alfalfa Molasses Meal per ton	18.00 @ 19.00
Bran, per ton	28.00 @ 29.50
Oilcake Meal	38.00 @ 39.00
Cocoanut Cake or Meal	23.00 @ 25.00
Cracked Corn	41.00 @ 42.00
Middlings	35.00 @ 37.00
Rolled Barley	27.00 @ 28.00
Rolled Oats	33.00 @ 34.00

VEGETABLES.

Arrivals in general continue fairly large, but there has been a good demand, and several lines show some improvement in price. Tomatoes are still very plentiful, hut 30c is about the inside price, and really good stock sells up to 65c. Beans and peas are offered less freely, and show a tendency upward, though little change is noted so far. Green peppers are rather easy, and eggplant sells even lower than last week, while cucumbers have picked up. Okra is offered freely, and ordinary lots are cheap. First-class corn holds up well, but off-lots are weak.

(Wholesale prices, San Francisco.)

String Beans	1 @ 2½c
Lima Beans	3 @ 4 c
Peas, sack	1.25 @ 2.00
Peppers, bell, bx.	30 @ 50 c
Tomatoes, River lugs	30 @ 65 c
Cucumbers, lug	40 @ 75 c
Eggplant, lug	30 @ 50 c
Summer Squash, lug	35 @ 65 c
Green Corn, sack,	50 @ 1.25 c
Okra, lug	30 @ 50 c

POTATOES AND ONIONS.

Potatoes show some firmness, though prices for most offerings are still comparatively low. A few sweet potatoes are coming in, and sell at high price. Onions find little demand here, and prices are weak, though some huying is heing done for Australia.

Delta Burbanks	.65 @ 1.00
Sweet potatoes, lb	5@ 7c
Onions, yellow, sack	.50 @ .60
Red, sk	.35 @ .50
Garlic, per lh, new	4½ @ .6c

POULTRY.

Poultry moves off a little better this week, and while arrivals for the last day or two have been freely large, broilers are hringing better prices. Small hens are rather easy. According to local dealers, the kind of coop in which chickens are shipped will make an appreciable difference in the price realized, as flimsy and unsightly coops are a nuisance to handle and make the stock look bad.

(Wholesale Prices, San Francisco.)

Live Turkeys, lh	15 @ 17 c
Broilers, 15 lb under	27 @ 28 c
Fryers	22 @ 24 c
Hens, extra, per lb	16 @ 17 c
Small Hens, per lb	13 @ 15 c

Squabs, per doz	$2.00 @ 3.50
Geese, per pair	2.00 @ 2.50
Ducks, young, lh	13 @ 14 c
Old	12 @ 13 c
Belgian Hares	7 @ 8 c

BUTTER.

Arrivals continue rather heavy, but there is an active buying movement which prevents any undue accumulation, and prices for extras and primes hold as for about three weeks past. Firsts are again quoted.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	27	27	27	27	27	27
Prime Firsts	25½	25½	25½	25½	25½	25½
Firats	—	—	—	24½	24½	24½

EGGS.

Arrivals are gradually dropping off, while the local demand continues exceptionally heavy, and the upward movement accordingly continues, though the advance is not as great as for the previous week.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	30	30	30	30½	32	32
Sel. Pul.	23	23	23½	24½	26	26

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Firsts	24½	24½	24½	24½	25	25

CHEESE.

The only quotahle change is an advance from 12½ to 14c. in fancy Y. A.'s. Arrangements have been made for trading on the Exchange in California flat cheese of the cheddar type.

(S. F. Dairy Exchange prices on flats and Y.A.'s.)

Y.A.'s, fancy	14 c

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG!
1915 Edition is FREE to you—Saves 20% to 40%

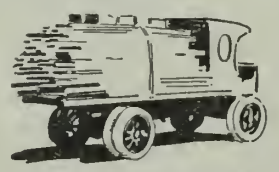
$15 to $18 Front Doors $10 Veneered Oak with Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further detalls.

Screen Doors 25% Off

—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

Style No. 8, $1.25



—This door usually sells for $1.65. Made of clear sugar pine and fitted with black screen wire, like picture, at our price..... $1.25

Style No. 9, $1.40

—Made of sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand lots of use; our price..... $1.40

Odd Doors $1 and $1.25

—Inside doors of best sugar pine, 5 panel Colonial and 5 panel O. G., styles a big lot of them, in all sizes.

Oregon Pine $10 to $15

—Good new rough Oregon Pine lumber, all sizes, at $10 to $15 per thousand.
—Oregon Pine lath, 4 ft., new, $2.50 per thousand.
—Best grade Slashed Grain Oregon Pine, sanded finish, $37.50 per thousand. This makes a beautiful interior finish.
—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

Paints $1.50 Gal.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities an dsell for the lowest prices.
—Standard House and Floor Paints, $1.50 per gal.
—Standard makes of varnishes at 25% off regular prices.
Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kaisomine 4½c per lh.

Black Graphite Roof —per gal.	50c
Standard Roof Paints—red, green, gray—per gal.	85c
Shingle Stain, made from pure ground colors —per gal.	50c

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet	$1.15
2-ply, double-sanded, per roll of 108 square feet	$1.40
3-ply, double-sanded, per roll of 108 square feet	$1.65
1-ply, "King" smooth, per roll of 108 square feet	$1.25
2-ply, "King" smooth, per roll of 108 square feet	$1.50
3-ply, "King" smooth, per roll of 108 square feet	$1.75

—Send for free asmple. Remember we ship direct to you.

SHOVELS!—At Wholesale Cost—SHOVELS!

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.
—Every one in perfect working condition, all atyles and sizes; note the prices:

Long Handle, Round Point Shovels, per doz.	$4.85 or 50c each
Long Handle, Square Point Shovels, per doz.	$4.85 or 50c each

DECIDUOUS FRUITS.

The local movement is active, and values are somewhat more steadily held than last week, though there is no particular upward tendency in most lines. Plums are stiffening a little, and a good many prunes are sold at fair prices. Ordinary lots of figs are lower, while choice stock is steady. Nectarines are coming in freely, and find ready sale at satisfactory prices. Apricots are about cleaned up. Peaches are plentiful and easy, though some varieties are well taken. Gravenstein apples hold up well, but Alexanders have dropped. Huckleberries and strawberries are easy, while other berries have picked up a little. A few casabas are arriving, and bring good prices. Cantaloupes are doing a little better, and watermelons show a wider range according to quality.

Huckleberries, lb ... 10 @12½c
Strawberries, chest ...1.50 @3.50

DRIED FRUITS.

Dried fruit prices still show rather a wide range, with many factors of uncertainty in the outlook and widely divergent views in the trade. Apricots are quoted at a wider range, the top price being readily paid for first-class fruit in the better districts, while large sales have been made in other quarters at the inside figure. Figs are in demand and rather firm. Sales of ordinary white figs are reported at lower prices, but little can now be had under 3½c.; while some Calimyrnas are held at a sharp advance. Prunes are still stiffening up, with local packers quoting a slight advance, and there appears to be a good foreign demand for this fruit. Peaches also are finding more demand in England than usual, and it is believed by well-informed handlers that prices will show improvement before long. A good export business is also reported in raisins. The new York Journal of Commerce says:

"The total amount of prunes taken during the past week by foreign buyers out of New York market is 15,000 boxes. All the orders were filled for immediate shipment and a part of the supplies have already been loaded."

In spite of the renewed interest which is being shown from foreign quarters for old crop prunes, the spot market appears to be laboring under an easier tendency. Domestic orders are only received for small quantities and there are rumors in the market that quotations are being shaded in some quarters. The impression prevails that no one wants heavy supplies on hand at this season of the year. According to advices there is an exceptionally heavy demand for all varieties of old crop raisins for European shipment, and several large orders are reported to have been filled in the spot market during the past few days. An order was sold at the beginning of the week calling for 3,000 tons of old crop raisins. Orders are in the market for additional stocks at full market prices. Shipments have been heavy for Canadian orders, according to report yesterday, and further inquiry is being received from Dominion sources. The Associated Company, according to advices from the Coast received yesterday, is entirely out of both Thompson's seedless and seedless Sultanas and no more are available at any price.

The Coast market for 1915 pack Apricots maintain its strengthening tendency. The packers are apparently being forced to buy from the growers certain quantities of the crop at advanced prices in order to cover their short sales for fall shipments. Quotations are from 1c. to 1½c. above those which were being asked a short time ago, and the range of prices is wide, according to seller and quality."

CITRUS FRUITS.

The eastern citrus markets are taking oranges and lemons at slightly higher prices, though lemons are still selling too low. At New York on Monday, August 9th, valencia oranges averaged from $3.75 to $5.45 per box, and lemons averaged from $2.10 to $2.60 per box. On the same day at Chicago, Valencia's averaged $4.25 to $4.75, and lemons $2.75 to $3.25 per box.

Shipments of oranges are going forward from California at the rate of forty cars daily and lemons nearly 30 cars. So far this season lemon shipments are largely in excess, and oranges about 300 cars less than last year. Prospects are for a smaller orange crop next season.

No further change in price at San Francisco is noted. Oranges move rather slowly locally, but there is quite a lively demand for grapefruit, and lemons are doing as well as usual at this season.

(Wholesale Prices, San Francisco.)

WOOL.

The greater part of the spring clip has been disposed of, but some rather large shipments are still moving to the east, where the market remains fairly strong.

Humboldt & Mendocino ...18@27c
Wool, Sacramento Valley, lb 18@22c
Southern, year's staple ... 15@18c
Six months ..... 14@16c

HORSES.

Prices for light drafters, chunks and wagon horses have been marked up a little, while mules are quoted lower. The local market is very dull, and practically no attention is given to anything but drafters. Few horses are being offered here at present. The country market, however, is described as about normal. Dealers state that the war purchases have had no immediate effect on the market, as they are paying lower prices than the home trade would pay for desirable stock, and are simply cleaning up a lot of inferior horses for which there is little demand here.

(Approximate values at San Francisco, based on auction sales.)

Heavy drafters, 1700 lbs. and up .....$275@300
Light drafters, 1550 to 1650 lbs ..... 200@225
Chunks 1350 to 1500 lbs. 165@185
Wagon horses, 1050 to 1350 lbs. .....125@150
Green Mountain range horses, 950 to 1200 lbs 50@ 90
Farm workers ..... 60@ 75

MULES.

1200 lbs. and up .....200@225
1100 lbs.... .....175@200
1000 lbs. .....140@160
900 lbs. ..... 90@150

HIDES.

Values remain very firm at the prices last quoted, all offerings being quickly absorbed.

HOPS.

Values continue fairly firm at the former level, and a good many sales have been closed, though the outlook is rather uncertain.

1915 crop, lb .....13@14c

SPECIAL DECIDUOUS FRUIT MARKETS.

By J. F. Nagle.

Shipments from the Sacramento river finish this week. Placer county points and the San Joaquin valley have cleaned up on Elbertas. There are a few varieties of late peaches yet to be shipped and what Bartlett pears go forward from now on will come from Placer county and El Dorado county and the Santa Clara valley.

Despite the fact that the Eastern peach shipments have continued heavy, especially from Arkansas and Oklahoma, during the past week, demand has been fairly active for California Elbertas at a price averaging 60c. delivered.

There has been considerable complaint from Eastern buyers on the arrival of California Bartletts, due to the quality and ripeness of the stock now arriving. This condition has affected the market and prices have not been satisfactory except on fancy stock. We look for an advanced market, however, on late Bartletts.

Several cars of Malaga grapes from Fresno have already arrived in the East but the majority of the stock has been green and not sugared. As the standardization law is in effect, the quality should show an improvement from now on. Tokays of the San Joaquin valley have just commenced to show color and shipments will begin to move about the first of September.

The following prices have ruled for the week:

New York.—Bartlett Pears, averaged $1.50; Wickson Plums, 92c.; German, $1.16; Diamond, $1.23; Kelsey, $1.27; Elberta Peaches, 60c.; Malaga Grapes, $1.14.

Chicago.—Diamond Plums, averaged $1.32; Wickson, $1.03; German, $1.35; Tragedy, $1.37; Burbank, 94c.; Bartlett Pears, $1.56; Malaga Grapes, $1.15; Thompson Seedless, $1.12; Crawford Peaches, 50c.; Tuscan, 75c.; Hale, 52c.; Elberta, 80c.

Boston.—Crawford Peaches, 42c.; Tuscan, 50c.; Elberta, 60c.; Wickson Plums, 72c.; German, $1.02; Tragedy, $1.25; Diamond, $1.12; Kelsey, 75c.; Malaga Grapes, $1.47; Bartlett Pears, $1.45.

Total shipments to date, 5411½ cars. Total shipments same date 1914, 6398¼.

Publisher's Dep't.

Advertising in the Rural Press is frequently as interesting and valuable to our readers as are the special articles which cost us effort and expense to secure. If any of our subscribers do not read the business announcements regularly they are not getting all of the value from the paper that they should. We will not knowingly accept an advertisement from a firm that does not treat its customers fairly or honestly, but in printing advertisements from about 200 people each week we may inadvertently get one now and then that may not be up to standard, but they do not last long in these columns. It is an accepted fact in business that advertised goods are the best goods, and readers who buy upon that principle will usually be in the right.

F. W. White of Elk Grove reports that he sold nearly $400 worth of purebred Berkshires to two men who came from a distance in answer to his classified ad. in Pacific Rural Press. J. K. Stewart of the same district is mad at us for accidentally omitting his classified liner the third time it should have appeared. The first ad., costing 30c., brought two men in a Ford from above Sacramento and they bought a young boar. The many answers to his ads make him anxious to have them appear regularly.

Little Flaxen-hair: "Father, it's raining." Father (somewhat annoyed by work in hand): "Well, let it rain." Little Flaxen-hair (timidly): "I was going to."

Killefer Bean Cutter

KILLEFER QUALITY

KILLEFER EFFICIENCY

A Bean Harvester is used only a few days each season, and we have found, after building various styles of Wheel Harvesters, that the rancher preferred a strong simply made Sled Cutter.

The work done by this tool cannot be excelled and is seldom equalled by any of the so-called Adjustable Harvesters on the market.

Extra Blades for all styles of Bean Harvesters are carried in stock.

The Killefer Manufacturing Company

California State Library

Hog Growers' Opportunity in California.

California imports pork, and exports pork feed, though we have a more favorable climate for pork production and disease resistance than elsewhere in America. Pork production is the easiest of all livestock to start with, and increases fastest.

[Written for Pacific Rural Press.]

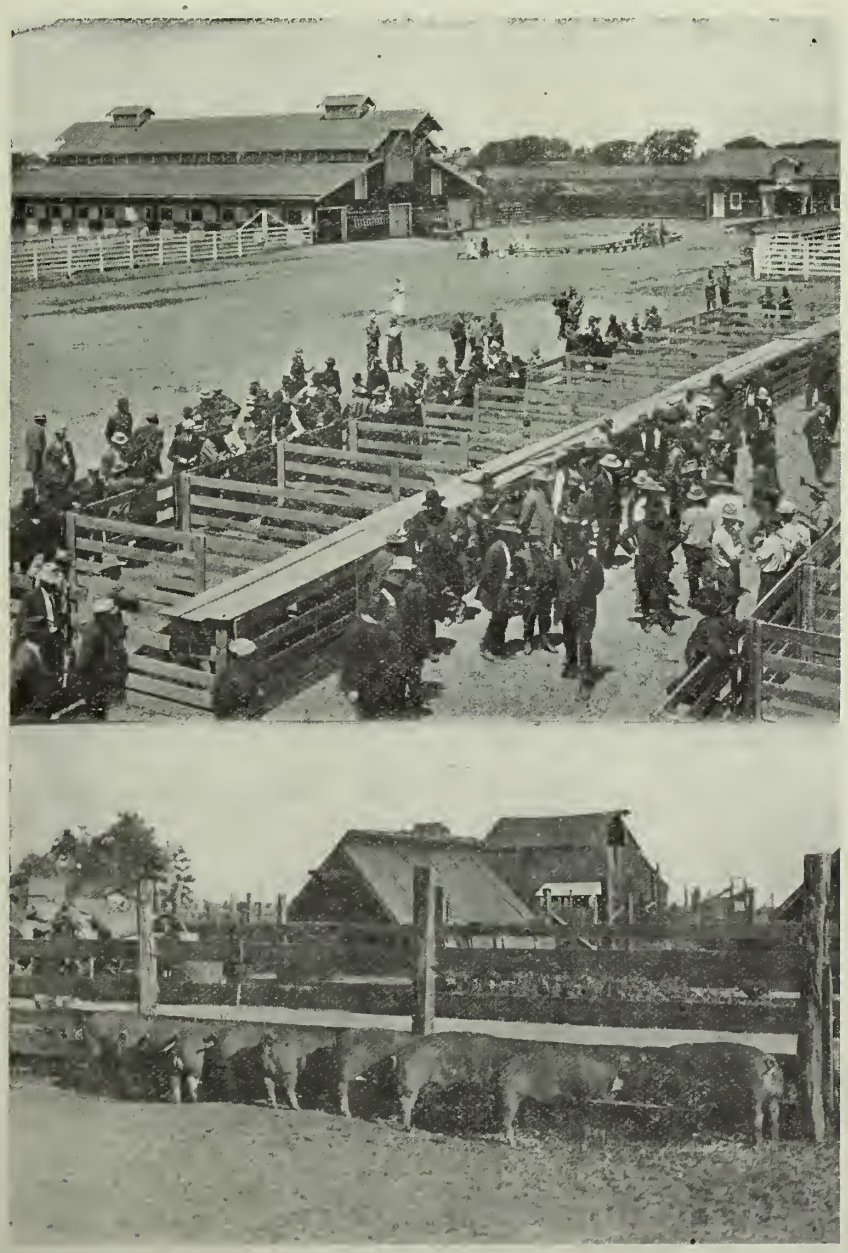
IF I WERE a grain or cattle farmer on a thousand acres or 10,000; if my present income promised sufficient to supply my reasonable wants, considering the habits of simple life fixed by past years of hard work; and if I did not care much about how posterity would make its living from the soil, I would hang onto my big grain and grazing acres and would not undertake new development along lines with which I might not be familiar; and would object to subdivision on my ranch.

But bye and bye, I would retire, and the boys would either allow the ranch to be sold or would divide it among themselves, or a subdivision company would probably make me an offer that would entice me to move to town.

Anyhow, that is the trend of the times. The number of farms over 100 acres increased till 1900, and have decreased since then, while those under 100 acres have increased rapidly from the start up to date. During the five decades, beginning in 1860, the number of farms of 50 to 100 acres increased from about 2500 in 1860 to nearly 11,000 in 1910. Those under 50 acres increased from 4275 to 43,139—1910.

Swine for Small Farms.—What are the operators of these small farms going to produce? Fruit would be fine if there were a dependable market for it. All signs point to a dependable market for all we can produce of meat.

But the new settlers, of whom we may expect more on our farms hereafter than heretofore, often have but little money to invest after improving their properties. That kind of meat, therefore, which the new settlers of the future can raise with the least capital and the quickest turnover, is the kind that must be raised, at least in their early years. Half a dozen considerations make the hog the most promising "mortgage lifter" and income getter of all.



Cholera Unnecessary.—Cholera has been the greatest reason for the condition, as stated in California's Magazine, that "In Illinois there are 60 hogs to the square mile; California has 8"; and as W. S. Guilford states in his new book on swine raising, "We import over 2,000 carloads of hams, bacon, and other pork products from the East, and nearly 1500 cars of live hogs from Utah, Idaho, and other States every year," about 40 carloads of pork products, besides about 30 carloads of live hogs—not annually but weekly.

But cholera is unnecessary. It cannot begin on a farm without being brought from another place where it exists. One who cares whether his herd gets cholera or not, will keep newly-bought animals in a separate pen until they prove to be free of disease. He will use all efforts to keep people out of his pens if cholera exists in the community. He will keep his hogs in a disease-resistant condition by supplying them clean pens and water, balanced feed, shade in summer and shelter in winter. Above all, he will keep his hogs out of the irrigation ditches. He will favor laws compelling them to bury, or keep their hogs out of irrigation ditches, and compelling them to bury or burn their cholera-dead out of the reach of buzzards and other birds and animals. When cholera visits neighboring herds, he will get the State veterinarian to send a man down to vaccinate his herd, if the local veterinarian seems incompetent.

Thus he will be pretty well protected from introduction of the disease, and will be protected against it if it does get onto the place. The mild climate of California helps greatly because hogs do not crowd together in close quarters as they do in the cold eastern winters.

The future, in respect to cholera-prevention, is more promising than the past, on account of the State-wide campaign for cholera eradication. In this,

(Continued on page 179.)

WHITEHALL ESTATES SALE OF BROOD SOWS.

With purebred sires, high grade sows will make a good foundation for market stock. Many California farmers, however, have observed that it is well to buy at least one or two purebred gilts because the pigs will be as good or better than grade pigs for the market, and if properly registered, may sell at four times as much for breeding stock. The lower pleture shows what may be expected from purebreds.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau, at San Francisco, for the week ending at 5 p. m., August 17, 1915.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	0	.26	.14	66	54
Red Bluff	0	0	0	96	64
Sacramento	0	0	0	96	56
San Francisco	0	.01	.01	68	52
San Jose	0	0	.02	84	50
Fresno	0	0	0	100	60
Independence	0	.04	0	96	52
San Luis Obispo	0	.01	.03	84	52
Los Angeles	0	0	0	94	58
San Diego	0	0	0	76	60

THE WEEK

The Panama-Pacific is surely going some; it has passed the ten-million mark in attendance; it has half a million surplus on hand for running expenses; it has a new aviator scroll-sawing the sky, and this week there are actually seventy-three congresses, conventions and conferences in simultaneous session! Every stile-turner takes the choice of his way of up-lift—fire-works, gas, gasoline or oratorical hot-air, and there is enough of each for every one—even though many a day scores a hundred thousand choosers. In fact, it is easier to have your own way at the Exposition than it is in coming to it or in getting away from it. All routes of travel are thronged. We have been in the thick of some of it and never saw a more contented, better-natured multitude. It is clear that all transportation companies are not only doing their best with the tremendous traffic, but are doing much better than any one expected they could possibly do—and this is what makes the people happy and indulgent. Simply looking around enables one to appreciate what the State would be if its population were suddenly doubled, and most people we have talked with are simply agreeably excited over it. Nearly all agree that California will be all the better when it gets fuller of people.

At present we are getting chiefly the professional and leisure classes of Americans — the kinds that usually take summer vacations of more or less cost and duration. Those who have various harvest-activities placed upon them are, of course, too busy to move now. They will come later and, we believe, in becoming style, because we read that an address was delivered last week at the Fresno Commercial Club by C. L. Seagraves, colonization agent for the Santa Fe, urging immediate preparations to arrange entertainment for the Eastern farmers, who will be brought through California on excursion de luxe trains. The first of the excursion trains will leave Chicago October 14th. Long stops will be made in California towns to give the farmers an opportunity to see the country in automobiles.

And so the real people are still to come, and those who fain would weary of millionaires, professors and school-ma'ams should take heart and buy some more gasoline.

A Rural Credit Movement.

We are glad to know that S. W. Baker of Santa Rosa, vice-president of the California Cured Fruit Exchange, has undertaken a practical effort to rally producers for a concrete conference on the subject of rural credit in California. He has written an appeal to various local co-operative organizations of the State to appoint delegates to attend a representative meeting for discussion and action on the subject of credit, on fairer terms and at fairer rates of interest, to all properly organized associations of producers. Such a meeting it is proposed to hold, either as a part of the Fruit Growers' Convention at Visalia on the third week in November, or as a collateral assembly. If the State Horticultural Commissioner approves, it may be part of the convention. In any event the occasion is opportune, and an influential gathering should result. It will be remembered that the last legislature authorized the governor to appoint a commission of five to consider rural credit propositions and to report before October, 1916, plans which they consider practical and desirable for California. Such a commission may be appointed before the date of the Visalia meeting, and may use the meeting as a means of ascertaining the desires of the people on the subject. We have often stated that we apparently had all forms of interest manifested except the definite desires of the producers as to ways and means. It is of course unfortunate that those who are to be most helped in their work by fairer credit conditions and requirements should have least to say about it in this State. Our bankers have really had more to say about the justice and feasibility of destructive agricultural credit in this State than the farmers have, and the bankers have also stated that better conditions were obtainable. The non-technical journals of California, which represent the sentiments and attitudes of the general public, have also widely and warmly approved fairer credit to farm producers and abolition of exactions and discriminations which now exist. The present State administration has made the attainment of fair rural credit provisions one of its leading aims. The only silent party in the discussions of the last few years has been the farming class. We consider Mr. Baker's enterprise toward bringing producers to a declaration, the best which has been proposed. The managers of the scores of fruit-selling organizations know very well the difficulties which now exist in the financing of their clients and they can declare themselves in a very concrete and practical way.

What Will the Reserve Banks Do?

It would of course be a part of the duty of such a formal, delegated conference as Mr. Baker is trying to arrange to take due cognizance of what can be done through the National Reserve Bank system. The kind of credit which fruit associations mostly need is the short-term personal credit, and this would not be likely to be sought through the same channels as the long-term credits for development, land-manning, etc. The two kinds of credit are not at all in competition or conflict, and each has its opportunities and advocates. Those who are fearful lest farmers should be considered as wards of the Nation, and given special privileges will, of course, be anxious to see what farmers can do with the Reserve Banks—just as other people do things. We are interested to see that Herbert Myrick, who has put forth several plans for rural credit in the various journals which he publishes at the East, has now taken to exaltation of the farmers' opportunities for credit through the Reserve Banks for loans of several months' duration. In his Orange Judd Farmer, the following paragraphs appear:

"For the first time in history, the banks have no excuse for not accommodating producers to the limit. If they ignore the federal reserve system and strive to exact the uttermost toll from the marketing of crops, the banks do so at their peril.

"No longer may the bank say 'money is scarce, we can only let you have half as much as you want,' and charge an ungodly rate for it. Such a statement is not true. For the bank can indorse such note, send it to the federal reserve bank, and by return mail get back newly issued federal reserve notes (cash) for full face value of the paper thus rediscounted. The reserve bank charges only 4% to 5% for such rediscounting, so that if the farmer pays 5% or 6%, his local bank gets the difference for its handsome profit.

"The farmer or buyer need not rush to market his grain, stock or cotton in order to get cash with which to meet pressing debts, but can borrow upon same and thus be able to hold or sell at will. The result should be more gradual marketing, with steadier prices, and less of the wide fluctuations that benefit only speculators at expense of both producers and consumers."

What Will Our Reserve Bank Do?

That is, of course, another question. Mr Myrick's commendation of resort to Reserve Banks is probably limited to the central and Eastern types thereof. We have our own local questions, but still what they are doing at the East may ultimately affect our practice. Hitherto, our Pacific Coast Reserve Bank has, if we are not mistaken, found that we did not need any of Uncle Sam's four-per-cent money because the San Francisco banks had plenty of money in their vaults for which they would like to get four per cent, or even less—from the particular classes of borrowers whom they consider desirable. Of course, the fruit producers and other farmers are not among their favorites. As we have previously remarked, they like a handler better than a producer, because a handler knows how to stack up security better. No one can tell how mellow San Francisco and other bankers may become when producers of our great fruit and other staples get their peerless security into shape. It was said long ago that a life insurance company had no respect for a claimant unless he came into its concern, feet first; then they fell down and worshipped. It may be that way with bankers. If so, it becomes clear that it is up to our producers to register a great kick, and some heed may be paid to it—providing they get security out of their properly standardized and warehoused product, on the collective endorsement of their associations and general recognition of their actual responsibility and the regularity of their operations. When they do this, and

especially when they demonstrate their trustworthiness by a certain amount of reserve or surplus funds of their own, they may effectively demand to be treated as are other preferred creditors. This will all be indispensable to the proper condition for private loans or institutional loans or for the use of State funds at the same rate they are loaned to others who have the art of creating acceptable security. All such things will naturally be brought forward and discussed at the delegated conference proposed for November in Visalia. If not, then at some other time; for truly farmers never can get themselves into the position of most approved borrowers without some such a foundation.

When in Doubt, Take the Trick!

Sometimes our exhortations seem to excite our readers to action: sometimes they arouse tender consciences and only unsettled people, to wit:

"I notice that you are always boosting co-operation. Is not this a violation of the Sherman law? If it is a violation of the law for manufacturers of implements to unite for the purpose of economizing in the purchase of materials and in the selling of their produets, why is it not against the law for farmers to combine for the same purpose? Does not the action of each restrict competition? Is there one law for farmers and another for manufacturers?"

There has been effort to exempt farmers and laborers from the penalties of the Sherman law and it may have been urged by certain parties for political reasons, but probably, with most persons this effort, which has seemed to involve class-legislation, has really been an honest effort to get at the real equities in the case, which may belong to certain producers and not to others; or in certain conditions and situations, and not in others. It seems to us the whole legislation evinces a sincere desire on the part of the people to get at equity and justice; it has stumbled plenty, truly, but it will finally arrive at the point desired. It is a serious mistake to consider the Sherman law and the principles which it has aimed to enforce as against co-operation. It is against some phases and methods of co-operation; not against the beneficent principles which underlie co-operation. Co-operation is against injustice and about the only way by which injustice can be done away. Co-operation is the fundamental support of our political, religious, social and industrial life. It is the only force, known to us, by which agriculture can defend itself against wrong and secure justice in the distribution of the products of its labor and investment. If phases of it offend our moral sense, it is so much the worse for the methods; it is all the more reason why we should hold fast to the principle until the methods are made true to it.

It seems to us that our farmers should proceed resolutely toward effective co-operative organization. The thing to do now is to get it; if there are wrongs in it, they will be stricken out later, and this experience should make co-operation stronger because truer and more just to all men and interests which have rights to be secured. But to raise theoretical, and generally fanciful, objects to co-operation before it has been attained, is like an old bachelor laying down rules for the behavior of his offspring. Once upon a time there were two darkeys who went out in the dark of the moon. Rastus was in the coop and Sambo held the sack outside. "Say, Sambo," was hoarsely whispered through the dark of the coop-door, "am it right to lift dese chickens?" To which hoarse whisper came, "Rastus, dat am a great moral question; hand down a pullet; if it is wrong we make rep'ration afterwuds." We are aware that the story proves too much, as most stories do, for it admits chicken-stealing as a proper mode of experimental conduct toward the demonstration of a great principle. Let us hope, however, that "rep'ration" was amply made, and repentance also. If, then, co-operation places the farmer in the position of reaching for chickens which are not surely his, let him hand down a pullet just the same. The exact ownership of the poultry will be determined later.

Queries and Replies.

Querists must give name and address.

A Catch-Crop of Potatoes.

To the Editor: I have a small piece of ground on which the alfalfa was recently drowned out. I have thought of trying winter potatoes on it now and seed to grain after that. The soil is loose sand. Is the nitrogen on the alfalfa roots sufficient fertilizer or would you advise an additional application of barnyard manure? The land was irrigated July 20. After plowing and harrowing, do you think ground would be too wet for potatoes? What variety of potatoes do you consider best for this locality? People around here say there is no success whatever with potatoes.—W. E. C., Turlock.

When intelligent people, who have tried it, say that any crop is not a success, it is wise to proceed cautiously and test out the question on a small scale before putting in much time or money. In many places potatoes are condemned because they are planted too late—not giving the plant chance enough to make good growth before drouth and heat come on. If they get such a growth they often finish up a good crop. Your land ought to make potatoes if the moisture keeps right; but if it dries out when the plant ought to be growing well, or if it gets too wet when the tubers ought to be forming, it is not reasonable to expect much of it. Drowning out of alfalfa is a bad sign for potatoes unless you can catch in with them between the drouth and the wet. For this chance you need an early potato, to shorten the period of the required conditions, and Early Rose is the one to try with. Plant a small patch now and put in some more next month—irrigating the ground again, for it if you find it too dry, and plant some more after the rains begin. In this way you will find out what you can count on. The land does not need more manuring, probably. Remember, however, that if your land is likely to fill up with water during the next four months, your game is risky.

Alfalfa on Russian Thistle.

To the Editor: Is it a wise plan to sow alfalfa on land infested with "Russian thistle"? What is the most successful means of fighting this pest?—P. M. P., Oakdale.

There are several plants which are locally called "Russian thistle" in California, so we are not quite sure whether you have the true Russian (salsola) or not. When asking about weeds, it is always desirable to send enough for identification. Supposing you have the true one, the answer would be: the way to kill out the plant is to keep it from going to seed. It is an annual and therefore has no hold-over roots. It can therefore be killed out by frequent mowing or by herding sheep on it, for it is liked by stock when young. It is desirable to sprout as much of the seed as you can by early-fall heat moisture and clean the land by several diskings. Then plow deeply so as to bury more seed, work up the surface, and put on the alfalfa in February, or later, if your land is frosty. If the alfalfa gets ahead it will run out the weed all right.

Horse Beans and Beets for Hogs.

To the Editor: What are the feeding values of horse beans and beets for hogs, and can horse beans be raised successfully in the San Joaquin Valley in the winter on old alfalfa land? What care and cultivation do they need?—B. A. C., Empire.

All beans are good for hogs if fed in connection with other feeds. Beans and beets constitute a balanced ration and are theoretically good when fed together. Study the hog, and his appearance and behavior will tell you more about it. Horse beans are more hardy against frosts than beans usually are. Near the coast they make good winter growth. With you it will depend upon how sharp the frosts are in your particular place. Horse beans make large, tall plants, and should be grown in drills about two and a half feet apart for horse cultivation. Drop the seed thinly, for the plants ought to be eight or ten inches apart in good soil.

Sweet Pea Straw.

To the Editor: What is the best way of using sweet pea straw for fertilizer? What crop would best follow sweet peas? How can the green aphis be prevented from damaging a crop of sweet peas?—C., Pismo.

When thoroughly dry, as it comes from gathering a seed crop, the straw can be spread, disked to break it up, and plowed into a heavy soil as soon as there is rain enough to deeply wet the soil. The straw can be spread in the corral, tramped fine by the stock, and spread with other corral cleanings at the beginning of the rainy season. It may also be piled, wet down and reduced by composting with farm manure. This will make a rich manure for garden use. Sweet peas improve the land for any crop which it is profitable to grow in the locality; so far as we know, everything from grain to vegetables is better when following them. Pea aphis must be killed with a tobacco spray as soon as they appear. They are hard to handle if allowed to get headway. Therefore, the young plants must be closely watched and spraying done as soon as the pest is discovered.

Probably Red Spider.

To the Editor: What is the trouble with our dahlias, oleanders, sweet Williams, etc., that are spider-webbed, specially on buds and blossoms? We first guessed caterpillars, but there isn't one to be found, and as to spiders, we see only an occasional one. But the plants wilt, hang their heads and look sick.—Y., Bellota.

If the webs are small and spread over the surfaces, and not fine constructions for large insect-catching, they probably indicate the presence of "red-spider"—a mite, not easily seen without a magnifier. If this is the intruder, the leaf-surfaces are scarified and have lost their deep green and polish. Of course, either lack of water or presence of alkali would cause the plants to wilt, but if they wilt with roughened and lighter-colored leaf surfaces, it is probably red-spider. The cure is dusting with sulphur—as for vine mildew, or hosing the plants with a good water pressure. These mites thrive in heat and drouth, and they hate a bath like a hobo.

DUST your sweet corn with arsenate of lead and clear $12.75 more an acre. This is the advice of James W. McColloch, assistant entomologist in the Kansas State Agricultural College.

For six years the department of entomology of the college and experiment station has been studying the worm and has found that a large proportion of the eggs deposited in the summer are placed on the fresh corn silks. From these eggs the worms that injure the ears originate. The young larvae on hatching begin feeding on the silks and eat their way down into the ear. It is, therefore, possible to control much of the injury by keeping the silks sprayed in the silking period.

Powdered arsenate of lead has been found to be the most efficient poison. A 75 per cent mixture of arsenate of lead with air-slaked lime or land plaster is practically as good as the poison alone. The dust is shaken upon the silks from an ordinary cheese-cloth bag or flour sack, or applied with a dust spraying machine. Under ordinary weather conditions four or five applications at intervals of three or four days are sufficient.

Cheaper Oranges---Cheaper Labor.

[Extracts from address by Charles C. Chapman, Fullerton.]

When I came to California some 20 years ago, 4000 cars of oranges were shipped. A car at that time contained about 15 per cent less fruit than now. The shipments soon, however, increased to 6,000 cars, while at the end of four years more we were sending 24,000 cars annually, an increase of 400 per cent. This sudden and tremendous expansion proved somewhat trying for a time, but improved marketing methods were devised and new markets found by the aid of a higher tariff, one that proved to be really protective; and soon we were readily selling 35,000 cars. We must not necessarily expect that we can now even double the present output as easily as it was quadrupled then. We can materially increase the shipments, but a too sudden or big jump might for a time put a crimp in our ambitions. We must not feel that it will be an easy task to market our enormously increased production in competition with the greatly increased shipments from Florida and from foreign countries. The tariff wall that so splendidly protected us during the years when the industry was expanding so rapidly, has been razed; so that in this respect, we are at a great disadvantage.

During these former years, very much more radical and important improvements were made in the methods of packing and marketing than we have reason to look for in the future. These were important factors in helping to expand. Some betterment in both handling and marketing will be made, but nothing startling need be anticipated. Yet some serious marketing problems will have to be met if we are to profitably market our ever-increasing crop in competition with the large output from foreign countries, without the protection we have heretofore enjoyed. The prospect for an early restoration of this protection is not bright.

Wages to be Reduced.—I think the chief item in readjustment will be the reduction of the cost of labor of culture and packing. Every employer of labor shrinks from an attempt to reduce wages. It is always unsatisfactory to do so. But the poorly paid foreign labor must be met by low-priced labor here, if our politicians refuse to grant the necessary tariff protection.

Ultimately, I think that unless we are adequately protected, the fruit industry will under one condition or another go into the hands of laborers such as chiefly prevail in southern Europe and Japan. They may be employed by growers and packing houses or they may buy or lease our orchards and grow and handle the fruit. In this way it can undoubtedly be done at very much less cost than under the present system.

Need Protection Soon.—Adequate protection must be secured before this evolution, this transference to foreign management and foreign labor, is too fully developed. When once this transfer has been made, when the industry has largely gotten into the hands of these people, we will then not particularly care whether protection is given or not for it will not be so greatly needed, and, therefore, such strenuous efforts to secure it will not be made as have been made in the past. What this will mean, not only to the orange business in which we have taken such delight and which has made California famous, but to our own fair Southland, I leave you to imagine. The picture is too distasteful for me to attempt to draw.

But the investment of $200,000,000 in the orange industry to grow and handle the crops from about 200,000 acres, involving about 10,000 individual growers, will not be permitted to suffer permanently from any cause over which man may have control.

SUGAR PRUNE ON PEACH.

To the Editor: Referring to inquiry about sugar prunes on peach, I had a little experience when the sugar prune was first introduced. The buds took well and made a very satisfactory growth the first year, but only about 10 to 20 per cent made a good union; the balance would break off at the bud. To get sugar prune on peach, the peach should first be budded or grafted to French prune, and then re-worked to sugar prune the following year.

Lancaster. **T. J. True.**

Indications point to an early maturity of the Butte county orange crop; and the outlook for a prosperous year for the growers in that section is very good.

How to Stop Dried Fruit Speculation.

Justice Chipman gives a ringing exhortation. How can peach growers afford to neglect organization to secure what rightly belongs to them and to protect their livelihood? What can we do for them? What will they do for themselves?

To the Editor: In your journal of July 24th is an article with the above caption, written by Mr. G. E. Merrill of San Jose, which starts a ball that should be kept rolling until its accelerated force brings the dried fruit speculator to his knees. I beg the privilege of using your columns to give further momentum to Mr. Merrill's protest.

I saw in the newspapers recently a statement that last year Mr. Wm. Grant, a fruit grower of Chico, was offered 2½ cents a pound for his thirty tons of dried peaches. Many growers were obliged to sell at that figure. He shipped his fruit in sacks to an interior town in Minnesota, and there personally disposed of it in the neighborhood to consumers at nine cents a pound. He found the grocers retailing dried peaches at 15 to 18 cents per pound. Mr. Grant paid all his expenses from the proceeds of his fruit and had left five cents per pound for his thirty tons.

I mention this instance to show that the speculators who go about the country representing that the Eastern market will not justify a living price here are not speaking the truth. We know that the consumer pays a price that will warrant the payment here to the grower of at least six cents, and often more. The fact is that the dried peach market East will take just as many at five and six cents a pound to the grower as at 2½ or 3 cents..

Inquiry among the retail grocers in the consuming States shows that the price paid here to growers is ridiculously low, and is in a large degree brought about by speculators who start in early to make contracts, and for their own safety, and greater profit, they beat down the price to the lowest possible point. The fact that sales are made at low prices soon becomes known at the Eastern markets, and tends to establish a price for the season. It costs about 2½ cents per pound to pick and dry peaches. Obviously we must cease growing peaches to be dried if the buyer and packer keep up this ruinous policy. The prune grower has a wider market, and does not suffer so much from the practices of the speculator and packer as the peach grower.

What we need is some sort of organization among peach growers by which, as Mr. Merrill suggests, 75 per cent at least of the growers will abstain from making contracts until market conditions and the supply are well understood. I would go further and fix a minimum price—say 5 cents—and that no dried peaches should be sold for less. Mr. Grant's experience shows that the prevailing system—if it can be called a system—of handling our dried peach crop is simply rotten. I commend the subject to the peach growers of the State. **N. P. Chipman.**

Sacramento.

APHIDS GET COMMON VETCH.

[Written for Pacific Rural Press.]

Common vetch has been tried quite thoroughly, especially in the southern part of the State, and has been found wanting for several reasons. One of these is the fact that the aphids kill it down before it can make much growth. Canada field peas are in about the same class, but the newly introduced purple vetch with which the Citrus Experiment Station at Riverside has been experimenting for two or three seasons, grows so fast during the winter time that it keeps ahead of the aphis.

This was strikingly shown early in March at the Limoneira Ranch at Santa Paula, where they have grown about 300 acres of the purple vetch during the past season. While the aphis could be seen thick on many of the growing tips of the purple vetch, it had all made so much growth that if pulled up erect it would reach nearly shoulder high, and a large part of it was green and vigorously growing. The older portions of the stem, however, in the worst infested places formed a dense mat of deadened stalks spread on the ground. This will make first-class humus and it contains a considerable percentage of nitrogen which will be readily available for the use of the trees when it has decomposed.

If the aphids should finally kill it off, it will be so late that the mallow and other weeds will be coming on to furnish a large additional amount of organic matter to be plowed under for humus.

The sections in the Limoneira Ranch where common vetch was grown had become raggedly grown with non-leguminous weeds, because most of the vetch was killed some time ago. It is only in exceptional cases that it obtained a growth of as much as two feet.

The important point in planting the purple vetch is to get it in early in September. It was sowed at the rate of sixty to seventy pounds per acre in the Limoneira Ranch from the first to the middle of Sept., and its advantage in out-distancing the aphis is noticed on the earlier planted areas. Seed for planting is scarce and hard to locate, so early arrangements for a supply should be made. It is mostly grown in Oregon, but last season the Limoneira people got the bulk of the supply.

The farmers of the Orland Farm Center are considering the feasibility of constructing, in co-operation with the U. S. Reclamation Service, an electric transmission line from the East Park Reservoir to the rural district around Orland. Sufficient energy can be controlled, should this plan be carried out, to furnish power, light, and heat for the town of Orland and the entire rural district surrounding.

The shipping of Thompson Seedless grapes from Sutter county has commenced, those from Sutter City being the first to leave.

The first carload of grapes left Livingston on Aug. 11 for the East.

Sulphuring for Vine Mildew.

It has been a bad year for mildew because of weather conditions; also because sulphuring is not properly done. If the subject is better understood, this need not happen.

To the Editor: There has been considerable mildew in vineyards here this season. Some people say the sulphur used has not been good, so I would like to know the quality of the two accompanying samples. Also, will sulphur lose strength by being kept over from one year to another, or by lying in the hot sun two or three weeks? How long would it do good after applying in a climate like Lodi, say around the fourth of July?—P. A., Lodi.

[Of the two samples sent, one is sublimated, the other is finely ground, and both are suitable for vine sulphuring. The following discussion of mildew-fighting by Prof. F. T. Bioletti is timely:]

Vine Mildew in 1915.

The mildew, powdery mildew or oidium of the vine, to mention its most common aliases, has been more prevalent and destructive this year than perhaps ever before in the interior valleys.

The Agricultural College has made some experiments and observations during the present season that should be of interest to those vine-growers who have suffered loss from this disease. While little or nothing useful can be done at the present season it is perhaps wise, while the damage is evident, to point out what seem the best methods of control.

The long accepted method of control is to dust the vines with sulphur during the growing season. Some growers state that they find this method useless or only partially effective. They instance cases where the vineyard has been sulphured five or six times without saving the crop from serious injury. An answer to this is that vineyards where the conditions are apparently identical have been saved completely by three sulphurings. They state further that serious injury has occurred in vineyards where 50, 100 and even 150 lbs. of sulphur per acre have been used. In answer to this, it can be shown that other similar vineyards have been protected perfectly by the use of 20, 15 and even 10 lbs. of sulphur per acre.

If the facts are correctly stated on both sides, they indicate that in some vineyards mildew is completely controlled by sulphuring at an expense of 50c to $1.50 per acre, and that in others, apparently similiar, the expenditure of from $2 to $5 per acre for sulphuring does little good.

The cause of this difference in results appears to lie in differences in the time and method of applying the sulphur. In nearly all cases examined in which sulphur failed to control the disease the first sulphuring was done late in the season. In most cases examined in which sulphur was successful the first sulphuring was done early. In some cases the cause of failure appeared to be imperfect distribution of the sulphur. Sulphur of sufficiently good quality seemed to have been used in all cases.

The recommendations which it seems safe to make now with regard to sulphuring next year are:

1. **Sulphur the vines early.** This means when the foliage is sparse; when it is possible to see daylight through every part of the vine; when it is still possible for a bee to fly between any two leaves without touching them. This will be when the shoots are not over 8 to 10 inches long.

At this time a cloud of sulphur, passing through the vine, will leave a particle on every minute part of the surface. Later the older leaves will have grown so that many surfaces will touch. If the first sulphuring is deferred, therefore, many areas of surface will escape the sulphur and furnish places where the mildew can live and produce spores to infect the new growth.

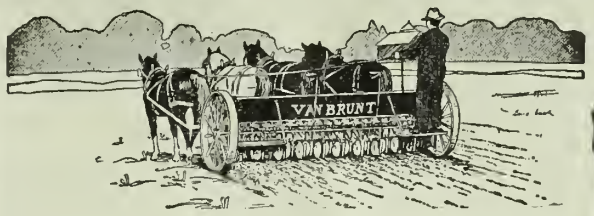
This first sulphuring should be done, if possible, in warm, dry, still weather. If such weather is not supplied by the Weather Bureaus, sulphur just the same. If the weather is very bad, resulphur in a week or ten days. These two sulphurings will together cost only half as much as a single sulphuring in July and be much more effective.

2. **Sulphur the second time at or before blossoming.** By this time the foliage will be dense in some parts; but these parts consist of the oldest leaves which have already been covered and protected by the first sulphuring.

3. **Sulphur the third time when the grapes are as large as buckshot.** In vineyards not usually much subject to mildew this sulphuring should be omitted. Later on more sulphurings will rarely be needed if these three are properly applied. For these late sulphurings it is usually best to wait until mildew appears.

4. **Do not wait until mildew appears** for the first two or three sulphurings. Perfect control is possible only by preventive treatment. The idea in sulphuring should not be simply to kill the mildew. It should be to prevent its growth, multiplication and the production of spores. If we wait until mildew is found on the vines control is impossible and even partial control is more difficult and expensive.

5. **In the first two sulphurings do not miss a single leaf on a single vine.** This can be done with 2 to 8 lbs. of sulphur per acre, according to the size of the vine, if we use an efficient knapsack dust sprayer. With other means of distribution more will be necessary.



6. **Use only finely divided sulphur.** Coarse sulphur does not float in the air well, does not attach itself readily to the surfaces of the leaves and canes, and is easily shaken off by the wind or washed off by the rain. All the sulphur sent in by growers for examination this year was fair or good.

In short, to control the mildew of the vine, sulphur early, distribute the sulphur perfectly and use fine sulphur.

Comparative tests with other remedies showed that winter treatments are useless and other spring and summer treatments inferior to sulphuring. Some liquid sprays are recommended on the theory that they will control the mildew at the same time as the vine-hopper, the grape-root worm and similar pests. This is dangerous doctrine as it leads to deferring treatment to so late in the season that control of the mildew has become possible.

June Valencias sold by the Villa Park Orchards Association of Orange county brought $41,530.10 to the growers, an exceptionally good price.

John Deere Implements

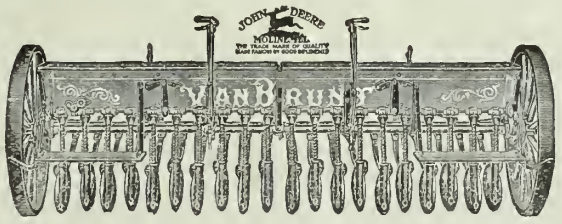
Van Brunt Single Disc Grain Drills

Van Brunt Drills plant any small seed from alfalfa to bearded oats, corn and peas exactly where it will bring the best results—at the bottom of furrows of uniform depth. All the grain is up and ready for harvest at the same time.

No seed is wasted, all the field sown. Van Brunt Drills have an adjustable gate force feed which compels an even, continuous flow of seed from each seed cup without bunching or cracking the seed. It cannot choke up.

The seed is planted at uniform depth. It beats the dirt. Individually adjustable pressure springs can be made to force discs to cut furrows even depth. Seed is conducted from hopper to furrow opener by metal tubes and there protected from dirt until it reaches bottom of furrow.

The "Light Draft Drills"



Van Brunt Drills are so called because they are light weight, well balanced and yet so strong that they work entirely satisfactorily under difficult conditions.

No stub axles are used—none required. Simplified construction makes Van Brunt Drills easier to operate.

Main axles are continuous. Drills are gear driven direct from axle. Each wheel drives half the feeds, insuring smooth running.

Hopper is extra large, well braced and has tight fitting two-piece covers. It does not sag.

Disc bearings guaranteed. They will last lifetime of

drill. Disc blades are high grade steel kept absolutely clean by spring steel scrapers.

Grass seeder attachment can be furnished for any Van Brunt Drill. It will sow broadcast or drill, as desired.

Write for free booklet "John Deere-Van Brunt Single Disc Drills." It explains why you will get the biggest yield by using Van Brunt Drills.

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements Steel plows, cultivators and harrows, corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders, portable and stationary grain elevators and corn shellers, hay loaders, stackers sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower,

RECIPES FOR FRUIT JUICES.

Bearing in mind the general discussion of last week, the following outlines of methods suitable for different juices may prove useful:

Red Grape Juice.—Choose grapes with "tart" taste and good color. Any well colored wine grape or such grapes as Concord or Isabella or mixtures of two varieties may be chosen: e. g., Muscat (white) for flavor, mixed with a red wine grape for color, make a good combination. Crush and remove stems. Heat in double boiler to 120 degrees F. Remove from stove and let stand in double boiler about six hours. Press through cheesecloth and let it stand twenty-four hours in a cool place. Draw off from sediment. Bottle. Cap or cork bottles. Pasteurize at 165 degrees F. in bottle as directed under "Pasteurization."

White Grape Juice.—Use white grapes of good flavor and "tart" taste; for example, Muscat grapes that are not too ripe. Crush and press out the juice without heating the crushed grapes. Let the juice stand over night in a cool place. Pour off settled juice and pasteurize in bottles at 165 degrees F. If the juice settles clear after pasteurizing, it may be decanted from the sediment, rebottled, and pasteurized. The beaten white of one or two eggs per gallon added before heating often aids in clearing.

Loganberry and Blackberry Juice.—Crush thoroughly and press out juice through several thicknesses of cheesecloth. If the crushed fruit is first heated to 130 degrees F. in a double boiler it may be pressed more readily. Add enough sugar so that when juice is diluted one-half with water, it will make a pleasing drink. Usually about 12 oz. sugar per gallon, i. e., roughly about three-fourths of a pint of sugar per gallon, will be about right. Bottle without dilution after sweetening, and pasteurize at 165 degrees F. Loganberry juice is too sour when bottled unsweetened, and seems to make the most pleasing beverage when sweetened before pasteurizing and diluted after bottle is opened. It has a very rich color and strong berry flavor; it is therefore very useful in punches, etc.

Currant, Strawberry, Raspberry, and Other Berry Juices are best extracted by heating the crushed fruits to about 130 degrees F. and pressing hot. Most of these juices must be sweetened to taste before pasteurizing at 165 degrees F.

Apricots and Peaches give a thick gummy juice that is not very satisfactory in appearance. The juice may be extracted by carefully warming the crushed fruit to about 130 degrees F. and pressing hot through several thickness of cheesecloth. The juice may be bottled without sweetening and pasteurized at 165 degrees F.

Apple Juice.—Choose rather sour apples of good flavor. Crush in a meat chopper or by other convenient means and press through strong cloth. Some form of press will be desirable. If the apples are clean and the weather cool, the juice may be safely allowed to settle over night. It should then be separated from the sediment, bottled, and pasteurized at 165 degrees F. If the juice settles well after pasteurizing, it may be poured from the sediment, rebottled and repasteurized, if so desired. However, the small particles of pulp seem to carry a great deal of the apple flavor and the clear juice is not so well flavored as the cloudy juice in most cases.

Orange Juice.—Choose thoroughly ripe oranges well after start of season—oranges of the first part of the season will give a bitter juice. Cut in half and extract juice. Strain out coarse particles of pulp. Bottle and pasteurize at 165 degrees F. A mixture of orange and lemon juice as indicated below is more satisfactory than plain orange juice.

Orange-Lemon Juice.—Cut oranges and lemons in half and extract juice. Blend the juice in ratio of juice from 12 oranges to about 4 lemons. Add sugar to taste. Bottle and pasteurize at 165 degrees F. The acidity of the lemon seems to protect the orange flavor to some degree against deterioration in pasteurizing.

Lemon Juice.—Press out juice. Add sugar so that when diluted to taste, a pleasing lemonade results without any further addition of sugar. This will have to be determined by trial. Bottle and pasteurize at 165 degrees F. This juice is diluted before use.

Pomelo Juice.—Cut fruit in half and extract juice. Add about 22 oz. sugar per gallon. Strain out coarse pulp. Bottle and pasteurize at 165 degrees F. in bottle.

Pomelo Orange Juice.—Blend equal quantities of each. Sweeten with 12 oz. sugar per gallon and pasteurize at 165 degrees F. This gives a bitter juice of pleasing flavor. Pomelo juice retains its flavor better than orange or lemon juices do.

REMOVING BITTERNESS FROM OLIVE OIL.

H. J. Baade, Farm Adviser of Napa County, recently wrote us concerning removing a bitter taste from olive oil. The matter was taken up by Professor Bioletti, who comments as follows:

"The bitter taste in olive oil so far as it has come under our observation, appears to be due to the natural bitter principle of the olive and this is soluble in water. It can therefore be removed by washing with pure water. Before doing this on a large amount of oil, make a test as follows:

Put equal quantities of the oil and water in a bottle, filling the bottle only above ¾ full. Shake the oil and water up together thoroughly and then let stand for 24 hours until the oil separates. The oil can then be syphoned off and tasted. One treatment may remove the bitterness, though sometimes two or three are necessary. This will show Mr. Smith whether washing will remove the trouble and how much washing is necessary. If there is a large amount of oil to treat it would probably be best to mix the oil and water by pouring or pumping them together from one vessel to another.

It might also be possible to remove the bitterness by the sprinkling method which is used for clearing oil. In this method the oil is placed in a vat of convenient size, and preferably tall in comparison to its width, and the water is then applied in the form of a fine spray on top. The water sinking through the oil clears it and takes up the bitterness. When sufficient water is accumulated at the bottom of the tank it can be drawn off and the process continued until the bitterness disappears. Of course, which ever method is used the water is almost certain to be taken up by the oil."

BEANS, BACTERIA AND PEPPERS.

To the Editor: We are growing a few commercial varieties of beans. The weevil is a factor in the industry here. We have been told to plant after May 10 and the crop will be immune from them. We have done so and will watch the results. However, is there any way for the layman to examine them and determine if they are affected? Also, is the inoculation of the soil with bacteria fixing preparations of any benefit? How many years are required to fix a strain of hybrid peppers?—J. S. P., Norwalk.

[The weevil deposits its eggs on the bean pod while green. The larva works its way into the pod and into the bean while very small, and the entrance apertures grow over and disappear. The larva lives its life inside the bean and makes no visible sign until it cuts its way out of the dry bean. We know no way to detect its presence until it approaches maturity. If the insects are known to be present the beans should be fumigated with carbon bisulphid before storing. If bacteria are not naturally present inoculation is of great benefit. Hybrid peppers must be grown and selected until old forms disappear. We do not know how long it will take.—Editors.]

NOW IS THE TIME TO ORDER
FRUIT TREES
By ordering now—from us—you will be assured of the best stock and lower prices than you will be able to secure later in the season.

Ridding Farm of Diabroticas and Pests.

To the Editor: A. K. T., Sacramento, can keep the diabroticas off her beans by spraying them with a solution of creolin, one tablespoonful to a gallon of water, as they do not like the smell of it and will avoid any plant sprayed with it. I tried arsenate of lead, but it neither killed them nor drove them away. I then added creolin to the lead spray, but it precipitates the lead. I therefore use the creolin alone. I kept them off lima beans and melons with creolin. The leaves were so badly eaten away that I thought they would never recover but they did and are making a splendid growth now.

Blue Jays.—I think your correspondent, Mr. Sirelow, will find that the jay is the worst fruit thief in the country bar none. Linnets are bad enough, but jays are infinitely worse and will stay around the orchard as long as a piece of fruit hangs on the trees. Blue jays and linnets are the most destructive birds that the fruit grower has to deal with. Robins attack cherries, but as a rule leave other fruits alone. I tried the plan of poisoning oranges, poisoned water and potato scarecrows. Neither killed or scared a single bird. After they had destroyed the cherries and started on the apricots I concluded to try the plan by which I got rid of the rats, viz.: poison the fruit they had damaged, and in a few days I got over 100 of them and saved my fruit. To prevent accidents I hung notices in the orchard and tacked one on the entrance gate, notifying people not to eat any damaged fruit as it might be poisoned with strychnine. In poisoning gophers I find that a piece of stiff cardboard 6 or 8 inches long and 1½ inches wide with the end turned up at the corners will hold the siruped bait as well as a spoon. The gophers usually chew the cardboard also as well as the beans, so that I now mix a little powdered strychnine with the sirup.

THE CALIFORNIA RED LINNET.

To the Editor: I had a little dispute the other day with my neighbor about the merits of the "red finch" or so-called "red linnet." He said these birds did a lot of good by destroying very many insects, etc. I claimed that they were seed-eating birds and therefore did more harm than good by destroying many dollars' worth of fruit. I told him these finches fed their young in same manner as pigeons do. Please give me full information about those birds. Was I right?—F. H. C., Corning.

[Answered by H. C. Bryant, University of California.]

[The general opinion of your correspondent regarding the linnet is true. The linnet, or house finch, as it is sometimes called, belongs to the sparrow family, and is a typical seed-eater. In many places in the State this bird is very destructive to both buds and fruit—in fact, it can be called the worst bird pest of the fruit grower of California.

In spite of the fact that this bird often damages fruit, there are several things which can be said in its favor. In many districts, fruit is not grown to any extent and depredations by the linnet are unknown. Many people in these sections therefore very naturally frown upon any attempt to destroy this bird, which they find a seed-eater and a beautiful singer. A full report as to the exact food of this bird can be found in the Biological Survey Bulletin, No. 30, published by the United States Department of Agriculture.

In answer to the second inquiry as to the manner in which the young are fed, let me state that the nestlings are fed very largely on regurgitated food. Parent birds during the breeding season are often found with partly digested food (mainly green seeds) in the gullet.]

SUCCESS WITH GOPHERS.

To the Editor: Gophers are a great pest in this part of the State. They are not bothering me, and I think it is because I placed galvanized metal screening about two feet deep in the ground. As gophers always start their holes underground, it is unnecessary to have any obstruction above. After using poisoned wheat, according to directions, for a few days their depredations on the inside ceased.—G. C. A., San Francisco.

[We presume you mean you put the screening around the area you desired to protect. Obstructions above ground are advised, because gophers, especially when mating, do sometimes take a run in the night over the surface.—Editors.]

The minimum price of 75 cents per box for "Standard" and "Fancy" Pajaro Valley Belleflowers was fixed by the Executive Board of the Watsonville Apple Distributors at a recent meeting.

EGYPTIAN VS. CORN FOR SILAGE.

To the Editor: Will you be kind enough to advise me at once on the following questions which I am very anxious to know about as soon as possible? Does brown Egyptian Corn make good silage? What is its feeding value compared to yellow corn? When should it be cut for silage?—K. B., Biggs.

[Regarding Egyptian Corn for silage, will say that in our opinion you can make good silage from this crop if it is sliced at the proper time. The time of cutting is of importance in making good silage however.

Experiments carried on in Kansas show that the crop should be practically matured; that in the seed should be matured. At that time the stalk is still filled with sap and will make good silage. If put in too green it will make sour silage. If it dries out too much sufficient water should be added to cause it to pack well.

From reports we have received from California growers, the siloing of the sorghums for dairy cow feed has not been entirely satisfactory. This we believe is due primarily to the fact that it was cut while too green for silage purposes.

In experiments carried on in Kansas the average acidity for three kinds of silage was: corn 2.03 per cent, cane 1.46 per cent and kafir 1.43 per cent. Egyptian corn and kafir would show practically the same result although the same experiment shows kafir silage slightly less valuable as dairy cow feed than Indian corn silage.

There is no question but that the greater yield of kafir to the acre offsets the slight increase in feeding value obtained from corn silage.

From this we should judge that your Egyptian corn, if siloed at the proper stage, should be practically as valuable as Indian corn.—Editors.]

FERTILIZING QUALITY OF DRY VETCH LEAVES.

To the Editor: Will the leaves (dry) that have shattered from vetch and fallen in the stubble, contain the same fertilizing properties if plowed under as a like number of green leaves?—H. I. B., Fallon, Nevada.

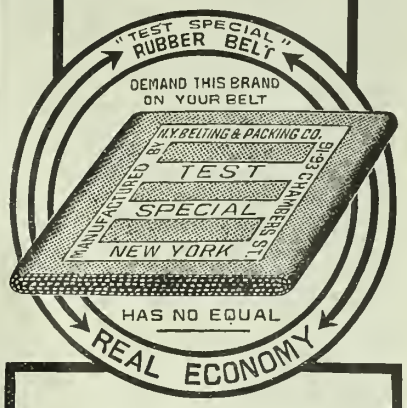
[They would contain the same fertilizing properties. Whether they would contain as much (allowing for water in green tissue) might be a question to be determined by analysis, but they are all right in quality. This is practically shown by the fertilizing effect demonstrated to belong to alfalfa hay and by the mold formation by dry leaves of forest trees, etc.—Editors.]

PEACHES DO WELL IN NEVADA.

To the Editor: A large show window in Reno, Nevada, has just been decorated with a lot of peaches which we believe are some of the best ever grown in the United States.

These peaches were brought in by Dr. C. F. Moore, from C. E. Swingle ranch five miles southeast of Hazen. These peaches go to show the possibilities of the Truckee-Carson project in the way of growing fruit.

Seven years ago, Mr. Swingle bought and began developing his ranch. He has growing cherries, almonds and Concord grapes which rank among the finest grown anywhere.



The Peaches on exhibit are of the Illinois May, Lee Cling, Eureka and Alton varieties and are simply delicious. **Chas. F. Barnum.**

Reno, Nev. Aug. 4.

Farm Adviser Searles of Yolo county reports making 111 visits during July. The control of the red spider, the hay crop, apricot irrigation and boys' agricultural clubs received special attention.

DO YOU USE Belting?

We Want to Send You a Sample FREE

We want every user of belting to know just how to test rubber belt—How to know that he is getting a belt that will do what he expects of it—That will do what is claimed for it. There is a sure test for rubber belt. We want to send you a little folder that tells you how to apply this test. With this folder we will send you a sample of

Test Special Rubber Belt

We ask you to test it—to test the the belt you are now using—to test any belt you are asked to buy. Then judge which is the belt you should put your money into.

Back of every foot of **Test Special Rubber Belt** is the experience of nearly three-quarters of a century of know-how, a factory with a reputation for making nothing but the best.

Mechanical Power on the Farm.

ENGINE MAKES ALFALFA OASES.

[Written for Pacific Rural Press.]

Three irrigations per cutting of alfalfa, and five cuttings per season, costs A. H. Kloss of Sacramento county 750 gallons of distillate at 7 cents per gallon by contract, and 25 gallons lubricating oil at $8.50, for 10 acres per season. On Aug. 6, Mr. Kloss had some of the finest knee-deep, thick-standing alfalfa on part of his field, ready to cut the second time, though sown only last March. The fine growth was due to the combination of warm climate, rich soil underlaid by sand about 14 feet deep, and plenty of water. The pumping is done by a 10 h. p. International engine belt connected to a 5-inch centrifugal pump in a pit 10 or 12 feet deep. A built-up ditch across the center of the field empties into the checks on both sides through six-inch terra cotta tiles, which are closed by tight-fitting galvanized caps. Gophers work around the tiles, says Mr. Kloss, and there is much trouble with washouts. He would prefer the corrugated galvanized pipes with sliding gates and a sheet of metal to face the water and prevent washouts, which system is in use on his brother Adolph's ranch nearby. The latter has a 15 h.p. International engine and a 6-inch Byron-Jackson centrifugal, over a well 90 feet deep in which the water comes within 20 feet of the surface with continuous running. The former's well is 75 feet deep. If any water is standing on the checks 24 hours after irrigation, drainage gates are opened and all the water runs off. If the weather were hot the alfalfa in standing water would scald.

"My pulleys aren't adjusted right for maximum efficiency," as was evident from the stream being thrown. An 18-inch pulley on the engine will be replaced by a 20-inch pulley to connect with the one 10 inches in diameter on the pump.

PUMPS WITH OLD TRACTOR.

[Written for Pacific Rural Press.]

The old 45 h.p. Mogul tractor belonging to Andrew Johnson of Sacramento county and operated by Oscar Melby, is worn so that its traction days are over; but now keeps lonely vigil over a forty-acre alfalfa field in the midst of which is a well for irrigation. A belt from the pulley wheel of the tractor runs diagonally to the 7-inch centrifugal pump in a concrete pit 10 feet deep. The whole outfit is too big for the well, because the tractor must run on one cylinder only, to avoid throwing all the water out of the well. Under average conditions it requires five days to irrigate the place. Two irrigations are given per cutting. A 15 hour day requires about 35 gallons of distillate.

INEXPENSIVE COTTAGE VENTILATION.

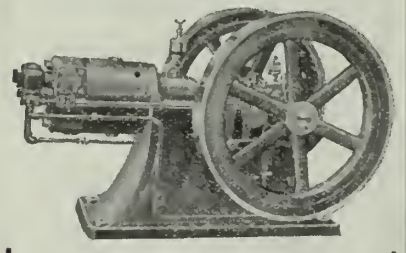
[Written for Pacific Rural Press.]

A cool inexpensive summer cottage is described by J. B. Francis of Placer county. It is built in rectangular form with a porch on each of the long sides. But the porch roofs lack 18 or 20 inches of reaching the broad eaves, under which are four transoms per room. The ceiling is solid, the ventilation under the eaves keeping the room remarkably cool. The attic has a ventilator to let out the air at night that has been warmed up during he day.

BIG CONCRETE ENGINE FOUNDATION.

[Written for Pacific Rural Press.]

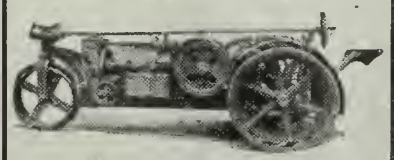
"My well can't keep the pump busy, but that's all right," says J. H. Castello of Sacramento county. "The longer the water stays on the ground the deeper it goes and the better for the alfalfa."



He has four acres of the finest alfalfa to be found in his section. The soil is 14 feet deep silt to the underlying quicksand, and according to Mr. Castello it ordinarily produces five or six cuttings per season aggregating 40 tons. It is now four years old. On the day mentioned, it would average 8 inches above a man's knees, was ¼ in blossom and would soon be cut. It was thick as hair and not a weed in it.

"It takes four days to water the piece, and I pull whatever weeds I see while I wait for the water. The ground is soft then, so the weeds pull easy."

The pumping outfit is a 15 h. p. Fairbanks-Morse engine and a 4-inch Samson centrifugal at the bottom of a concrete pit 14 feet deep. A tank 40 feet high is supplied for use about the buildings and for fire protection.



The feature of the outfit is the engine bed of concrete 5 feet deep and 4½ feet wide. "The troubles of many engine users are due to the excessive vibration allowed by too small a bed. Then the whole thing often shakes loose in the dirt and it doesn't take long for the bearings to wear out."

It is easy to start the big engine. The flywheel is turned to get some compression in the cylinder: a match broken off near the head is inserted into the "starter" which is then inserted through the cylinder jacket, striking a projection which lights it and causes the first explosion. This carries the engine around far enough

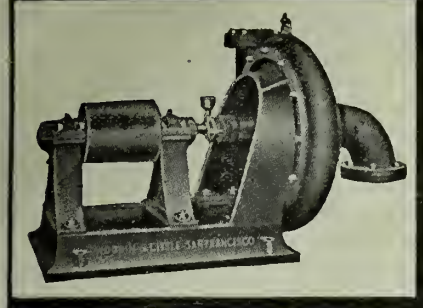
A Better Make Not Made

For Water Deep Under The Ground



Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

R. F. WILSON, STOCKTON, CAL.

to give an explosion from the 6-cell battery. A magneto run by contact with the flywheel gives the spark when it reaches a speed of about 500 revolutions per minute. A double switch disconnects from the batery and conects the magneto.

CONVENIENT OIL VS. FROST.

Systematic economical distribution of oil for frost fighting is obtained on the Limoneira Ranch of Ventura county. Tank cars are run to headquarters on the ranch via a private switch and are connected to pipes, which open great concrete underground reservoirs holding 100,000 gallons each. The oil is pumped from these reservoirs through two miles of three and four-inch pipe through the heart of the orchard to two steel tanks located about 180 feet above the level. It gravitates back to hydrants at various parts of the orchard convenient for frost fighting. In the spring, when the frost pots are cleaned, the pressure from above is shut off and the oil from the pots dumped into the pipes at the hydrants to gravitate to the concrete reservoirs. Then the hydrants are closed and the oil pumped up to the steel tanks. Quick work is made possible when the frost alarm rings, because everything is handy.

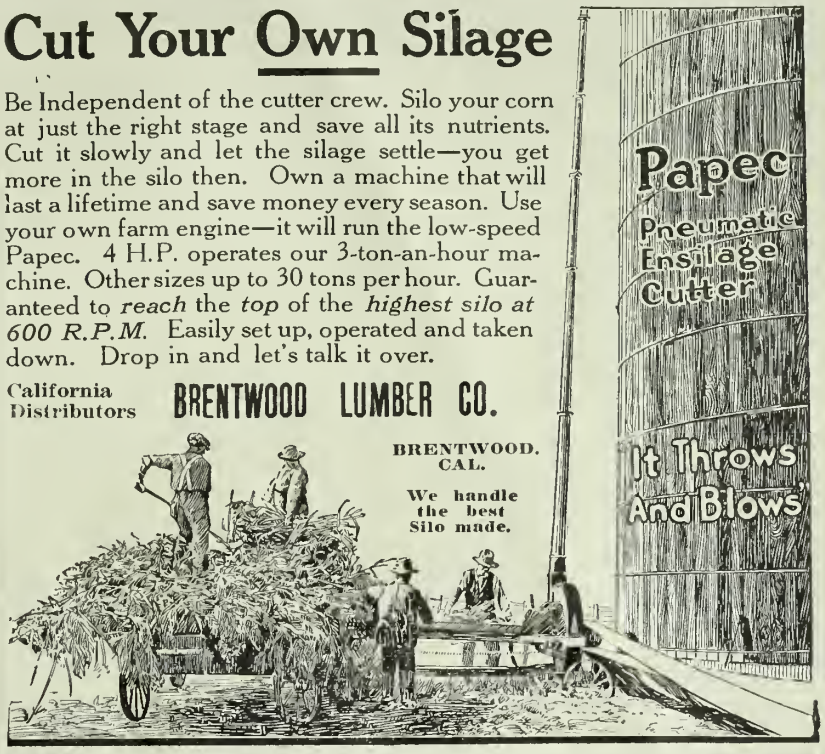
There were 10,724 pumped wells for irrigation in California in 1910. Of these, Los Angeles county had 1673, San Joaquin 1618, Sacramento 1168, Fresno 855, Santa Clara 800, Tulare 794, Riverside 792, and Orange 580.

The Samson Iron Works of Stockton are overhauling their plant. They expect to put out two new models of the Sieve Grip tractors this fall.

The Tulare County Power Co. (farmers' co-operative) has sold out to the Mt. Whitney Power Co. for $550,000. This terminates a bitter struggle which began before the co-operative company's poles were all set.

Approximately 50 per cent of the entire motor vehicle registrations of the State Aug. 1913 to June 1914, were made from San Diego, Imperial, Orange, Riverside, San Bernardino, Los Angeles, Santa Barbara, Ventura, San Luis Obispo, Kern, Inyo, and Mono counties, according to the 4th biennial report of the State Department of Engineering, just published.

One hundred thousand boxes of apples were recently sold to the Netherlands consul by growers of the Hood River section of Oregon. The price was $1.50 per box and the fruit will be shipped to Netherland growers in October.



Cut Your Own Silage

Be Independent of the cutter crew. Silo your corn at just the right stage and save all its nutrients. Cut it slowly and let the silage settle—you get more in the silo then. Own a machine that will last a lifetime and save money every season. Use your own farm engine—it will run the low-speed Papec. 4 H.P. operates our 3-ton-an-hour machine. NATIONAL FOREST REVENUES INCREASED.

The National Forests turned into the United States Treasury during the fiscal year ended June 30, 1915, nearly $2,500,000, an increase of more than $40,000 over the receipts of the previous year, according to a statement just issued by the Forest Service. The timber sales, which amounted to $1,164,000, yielded on account of the depressed condition of the lumber industry about $79,000 less than those of the previous fiscal year, but the gain was made possible by larger revenues from other sources. The grazing receipts, which totaled $1,125,000, increased $127,000 over last year, and the water power receipts showed an increase of nearly $42,000. The total receipts from water power amounted to nearly $90,000, of which $64,000 was developed in California.

The American Beet Sugar factory at Oxnard started up last Saturday, and sixty-eight tons of beets were sliced in the first hour's run. Between 6,000 and 7,000 tons of beets were on hand for the opening of the factory. The season's run is estimated at about 100 days, during which the entire factory will run day and night.

General Agricultural Review.

DECIDUOUS FRUITS.

An estimate of the apple crop of the United States places it at about one-third less than last year.

Ninety tons daily is the average pack at the canning plant of the Kings County Packing Company at Armona.

The Central California Cannerles Company will open shortly in Yuba City for a month or six weeks' run on midsummer cling peaches.

It is reported that practically all of the peach crops in Sutter and Yuba counties have been sold or contracted for at the present time.

Government aid, the nature of which is unknown, for disposing of the 1915 dried peach crop, is hoped for by Fresno county growers.

With three new packing houses in readiness to handle their product, pear growers of the Colfax district anticipate a busy season. Bartlett pear picking began on August 16.

On August 7 the Tulare cannery reopened and will begin packing peaches. It was closed for a short time on account of shortage of fruit.

Bartlett pears and plums are being shipped in large quantities every week from New York to South American markets by the California Fruit Exchange.

According to County Horticultural Commissioner H. P. Stabler, the red spider causes more damage to the fruit growers of Sutter county than any other pest.

A new peach has been produced by Kelly Bros. on the Kelly Bee Ranch of Santa Barbara county. It is an unusually fine variety of peach, of crimson hue, evenly colored, with the fruit of a deep yellow.

Alexander Sherriffs of Healdsburg denies that there are any grounds for the statement that prunes are dropping badly in the Alexander Valley, Sonoma county. As Mr. Sherriffs and his brother purchased most of this crop, he certainly ought to know.

GRAPES AND SMALL FRUITS.

A report from Lodi says wine grape growers are much more optimistic over the outlook for the year, and believe they will not suffer as much as had been anticipated through the $1.10 tax laid on brandies used in the fortification of sweet wines. The reason for the optimism lies in the fact that West & Son, pressed by independent competition, have contracted for several thousand acres of vineyards at $10 a ton, the price fixed in the contracts they previously canceled.

Grape growers want to know why statistics on one of the most important fruit crops of the State—grapes—were not included in the July crop report of the State Board of Horticulture and asked Dr. Cook, the State Horticultural Commissioner, "what about it?" The Doctor declared: "We will cheerfully furnish the statistics if they are wanted," and intimated that he would take steps to arrive at an understanding with the State Viticultural Commissioner on the subject.

Secretary Sheehan of the State Viticultural Commission states the vintage season is late and crushing in the Sacramento valley will not commence before September 15 and about 10 days earlier in the San Joaquin valley. He estimates the entire crop for the state at 75 per cent of normal, but would not venture to say what proportion of the crop the wineries would handle, the heavy tax proposed by Congress making conditions uncertain. The present outlook for wine grape growers and wine manufacturers is far from bright.

CITRUS AND SEMI-TROPICAL.

The packing house of the Butte County Citrus Association at Thermalito will open the latter part of October.

A new building is about to be erected by the Foothill Packing Company of Lindsay to be ready to handle the citrus crop in October.

A meeting was recently held by orange growers of the Villa Park section of Orange county, which was addressed by experts from the Riverside Citrus Experiment Station.

That the orange crop in the Tule river section of Tulare county will be about normal this season is the statement made by a prominent grower there. Good prices are expected due to the fact that the southern markets have been practically cleared.

OLIVES AND NUTS.

Messrs. Weiman and Foley, who own 228 acres in the Palermo section of Butte county, are making preparations to plant the tract to olives.

The harvesting of almonds in the Carmichael Colony of Sacramento county will commence shortly; many of the growers have purchased almond hullers.

The 25%-above-normal walnut crop predicted for Orange county will ripen two weeks earlier than usual, growers expecting that the harvest will be well under way by the middle of September.

An association has been formed in Oroville for the purpose of handling the olive crop of that section. It is expected that this year's crop will be handled by the new association, the product to be marketed through a Chicago house.

MISCELLANEOUS.

The Department of Agriculture estimates that American farmers will harvest close to a billion bushels of wheat this year. The exact figures given in the report are 966,000,000 bushels.

The United States Department of Agriculture is warning sportsmen that the Federal regulations as amended October 1, 1914, for the protection of wild fowl will be strictly enforced.

Reports and maps on the Sacramento-San Joaquin river flood control projects, irrigation data, use of motor vehicles and descriptions of the State highways are contained in the biennial report of the State Department of Engineering just issued.

Frank Henry and wife met with a serious automobile accident while on their way from San Francisco to their home in Fresno county early last week, near Turlock. Both suffered broken limbs but will recover. Mr. Henry will be remembered as the vineyard expert from whom we have quoted largely of late.

Farmers of Carson valley, Nevada, have finished cutting their first hay crop, and within another two weeks will begin on the second for the season. Though the spring was backward the crops are good and the second gives promise of being fully up to standard. There have been no complaints of scarcity of water up to date.

Hop-pickers are arriving in Wheatland, Yuba county, by hundreds, but as great care has been taken by the growers in selecting the people who will be employed hop picking this year, a precaution made necessary by former labor troubles, many families with scarcely any funds find themselves stranded and are causing the county officials some uneasiness as to getting them away again. Where the crowds come from is said to be a mystery.

Grave disorders are reported in the north of Portugal owing to a new treaty of commerce which will give the southern provinces the right to label some of their wine products "port wine," a name hitherto supposed to be the exclusive property of the Douro and Oporto producers. Meantime, California will continue doing business in this commodity as of yore, all orders receiving the usual prompt attention.

The 1915 report of the State Board of Agriculture is just issued. It shows that during the 10 months ending April 30, 1915, California live stock and food-stuff exports were $71,873,371, an increase of $13,451,110 over the same period last year. The report is full of statistics regarding area, population, and production of the farms by counties, by products, by breeds, varieties and kinds for the years 1850 to 1915. Irrigation, water transportation, roads, and natural resources are described, and statistics of each county's agricultural resources are given separately.

F. C. Reimer, Superintendent of the southern Oregon Experiment Station, before the California State Fruit Growers' Convention held at Palo Alto recently, declared that the use of sulphur as a fertilizer for alfalfa would increase the yield as much as 600 per cent in some instances, would improve the color by making it a darker green and that fields treated with sulphur are much freer from weeds. He advised farmers of this state to try about 300 lbs. on one acre and watch results.

Experimental tobacco growing at Grass Valley has resulted in the successful production of small crops of five distinct varieties of the "weed." Several of the methods used in proved tobacco-producing countries were experimented with and it was found that all may be successfully adopted in California. The experimenting ground covered about four acres and a portion of the plantation, about one-fourth of an acre, was covered with light cloth, forming a gigantic tent, the purpose being to experiment with a certain variety produced under those conditions.

The Department also issues the following warning: "Investigation by the Bureau of Chemistry has shown that there exists a practice of shipping into interstate commerce, wormy or weevil-infested horse beans, broad beans (Vicia faba). These horse beans are used almost entirely for food purposes. This infestation does not occur in transit, but during the development of the bean, and can be easily detected by examination of the beans before shipment. The Bureau will regard as in violation of the Food and Drugs Act, June 30, 1906, all horse beans shipped into interstate commerce or offered for importation into the United States, which are so infested to any material extent."

A Long Island man has found a use for wax paper drinking-cups after they have been used. He grows tomatoes in his garden and finds that by cutting the bottom out of a drinking-cup, slipping the young plant through what is left and planting so that the cup is half buried in the earth, the plant will be safe from cutworms. He says that cutworms attack the tomato vines just at the level of the ground and never come above the surface. The cup acts also as a reservoir, holding moisture in the soil it contains and letting it soak down to the roots without washing out into the surrounding earth. He uses the cups, also, in planting slips of any sort, cutting a hole in the bottom for drainage, filling with earth and placing the whole in the ground. As the slip grows its roots destroy the remnants of the cup.

SEBASTOPOL APPLE SHOW.

The Sixth Annual Gravenstein Apple Show at Sebastopol opened strictly on time with music, speaking, and bright lights. Great crowds thronged the town and inspected the exhibits, which as usual consisted of fresh and dried fruits both in commercial exhibits and in unique designs worked out for decoration. Among those who exhibited boxed apples in large quantities were the Sebastopol Apple Union with several hundred boxes, the Hallberg Ranch, C. H. King, Laura E. Bariow, M. J. Moniz, Oscar Hoensch, J. P. McDonell, Frei Bros., Kauffman & Arnold, Mrs. C. P. Weyhe & Sons.

The Sebastopol Apple Union also showed fresh and dried blackberries and fresh strawberries. Exhibits of jellies and preserves not only of apples but of other fruits were a feature of the show. Mrs. Hilda B. Neilsen had one of the best exhibits of jellies scientifically made. In the bungalow room decorated by the Pleasant Hill Home Culture Club was an artistic array of jellies, fruits, and farm products, decorated with home plants. A 12-foot reproduction of Luther Burbank's home decorated one corner of the big tent, being built of corn, grain, and beans with spineless cactus shingles, and dried apple sidewalks. Mr. Grohe, Santa Rosa florist, had a beautiful moss arcade filled with fern decorations and beautiful flowers. Graton had an apple-covered Exposition star, the three-foot points of which represented the eight districts surrounding Sebastopol. A fountain sprinkled from the crown of the big apple on top of the star into a 16-foot pond also surrounded by little fountains and by pillars connected with strings of apples. The pillars were set in a moss circle decorated with Gravenstein apples cut into the shape of tulips. A dried apple Liberty bell in which the crack is made of prunes was perhaps the most striking exhibit of all. Many other exhibits were scarcely less noteworthy than the ones mentioned.

Hog Growers' Opportunity in California.

(Continued from page 169.)

the State Veterinarian's force is co-operating with the University, the U. S. Dept. Agr., the county veterinarians, county advisers, county supervisors, and swine breeders' associations. A most prominent feature of this campaign is the cleanup that must follow every attack. The premises and grounds can be reasonably disinfected without too great expense, and those hogs which have been sick but have recovered may be dipped or washed to help prevent reinfection, and kept separate for two or three months.

With freedom from disease better assured in California than elsewhere, markets for the pork are to be located before joining a movement for 5,000,000 hogs in California by 1925.

There are now 877,000. Estimating one-tenth of these as brood sows and boars, Californians are eating nearly 800,000 hogs per year which have been raised in California. The imports represent about 683,000 live hogs, making a total of some 1,483,000 hogs consumed in California with her present population.

The population of California increased in the following proportions by decades beginning 1860-70: 47.4 per cent, 54.3 per cent, 40.3 per cent, 22.4 per cent, and in 1900 to 1910, 60.1 per cent. In the newly issued report of the California State Board of Agriculture, the population for 1914 is given as 2,757,895, an increase in four years of more than 16 per cent, or over 4 per cent a year. What the World's Fair will mean in attracting settlers to the State during the next ten years, can only be guessed; but there is little reason to think that the population will increase less than 50 per cent.

This would make possible a total consumption in California in 1925 of 2,224,000 hogs without increasing the per capita consumption. To produce these at the rate previously estimated would require over 222,400 breeding stock, making about 2,446,400 hogs required for meat use alone in California.

Outside Markets. — The intermountain region is fast being populated and may be counted as an increasing market. South America and the Orient are potential markets. This is shown by the actual exports from San Francisco alone of quantities of pork not large enough to materially affect the estimates given above, but large enough to show that exportations would be feasible if we had the supply. In 1914, as listed in the San Francisco Chamber of Commerce export book, China took 6701 pounds bacon, 19,000 pounds ham, and 5100 pounds of lard from San Francisco. Chile took 1000 pounds bacon, 9200 pounds barreled pork, and 1,000 pounds lard. The Philippines took 142,000 pounds bacon, 146,000 pounds ham, and 93,000 pounds lard. When we have enough of our easily-produced California pork to develop our logical outside markets, the number raised in California can only be guessed. Our exports might easily equal our home consumption.

Hogs Easiest to Start.—In deciding what to raise on these subdivided farms, of secondary importance only to the prospective markets is the matter of getting a start with available capital.

In no line of livestock is the initial investment so small and the increase so rapid. There is no reason why the increase might not be a dozen per sow per year, at the conservative rate of three litters every two years. With the increased use of purebred stock for sires, greater care will be given to the litters, and a larger percentage raised.

Expensive Equipment Not Needed.—For equipment, all that is necessary is to keep the sleeping quarters dry, provide shade, maintaiu tight fences, keep feed out of the mud, and have a dipping tank ready for use. An 8x12 portable shed-roofed hog house with an 8x12 shade attached will require about 800 board feet including the roof, and may be used for two lots of hogs by partitioning. Other satisfactory hog houses may be built cheaper than this.

Feed Grown at Home.—The feed can be raised on the farms, and should be fed to animals because they remove but a small proportion of the fertility elements, but put the feed into the most profitable marketing form.

Experiments in the cold northern states indicate that about 4½ pounds of barley make a pound of pork on a 100 pound hog. A very slightly greater weight of barley was required, than of corn meal. The California State Board of Agriculture shows that in 1913, we exported 17½ million bushels or 875,000,000 pounds of barley—enough if all properly fed to hogs, to have produced 193,000,000 pounds of pork of first quality. The sorghum corns, which are particularly fitted for heavy production in our State, produce not quite so much pork per pound as Indian corn, but are much used and satisfactory. Over 2,000,000 bushels of Indian corn were produced in California in 1914, more than in any year since 1896. These grains may be used in small proportions with alfalfa, skim milk, the wastes of the orchards, vineyards, feed lots, and kitchens, to bring the pigs to fattening age and size, when the grains are fed heavily for a short period to add fat and harden it to market quality.

Purebreds Must be Increased.—But not only with market hogs are we concerned. They are most economically produced by use of purebred sires. To supply these purebred sires will require an immense increase in the number of farmers raising purebred stock only. Many a man with experience says that it costs less to feed, but a little more attention, to raise purebreds than grades or scrubs—and many a man is beginning with a purebred gilt and whatever cheaper hogs he can get. He aims to get rid of the cheaper hogs as the purebreds increase to the capacity of the farm. The weanling pigs sell at $15 to $25 each for breeding, if registered; considerably more per pound than is paid for hogs "practically purebred," or purebred but not registered.

With all her natural climatic, feed, and market advantages, why should not California supply not only her own market hogs, but her own breeding stock, and some extra of both to ship far and near at profitable prices.

NURSERYMEN IN CONVENTION.

Last week the Pacific Coast and the California Nurserymen's Association held three days' joint sessions at San Francisco. While the attendance was not as large as had been hoped, yet the most of the sessions were full of interest and the visiting nurserymen enjoyed them; also the several social functions provided by the local committees.

Conditions affecting the nursery industry were generally discussed, covering quarantine regulations, more home-grown stock, revision of railroad classifications, and uniform horticultural laws in western States.

California nurserymen feel that their industry is vitally affected by an order of Postmaster-General Burleson, requiring that parcels post packages of fruit trees be inspected at point of destination. The nurserymen suggest that the inspection against insects, pests and disease be made at the shipping point, the clearance there permitting of immediate delivery at point of destination. It is asserted that a large percentage of horticultural shipments are to points where there is no inspector. The result is, the package has to be forwarded to the nearest city where there is such an official, and after inspection there, remailed to the original point of destination, the consignee paying this extra postage. It is further asserted that this delay in delivery frequently causes the death of the trees. The resolutions adopted by the California Association of Nurserymen not only complained of Burleson's order, but demanded uniform horticulture laws in all Western States, and a revision of railroad classifications on style and shape of packages containing plants and small trees.

The Pacific Coast Nurserymen elected officers for the coming year as follows: President, S. C. Miller of Milton, Oregon; Secretary, C. A. Tonneson, Tacoma, Wash.; Executive Committee, John Vallance, Oakland; M. McDonald, Orenco, and Mr. Bennett, Medford. The vice-presidents, one from each State, were all re-elected.

The California Nurserymen elected officers as follows: President, John S. Armstrong, Ontario; Vice-presidents, Charles Howard, Hemet; John Vallance, Oakland; George F. Otto, San Diego, Max J. Crow, Gilroy; T. E. Mabee, Fresno; Secretary-Treasurer, H. W. Kruckeberg, Los Angeles; Executive Committee: J. D. Meriwether, Los Angeles; Frank H. Wilson, Dinuba, and John Gill, West Berkeley.

A political candidate for an agricultural district, after making a speech, announced that he would be glad to answer any questions that might be put to him. "You seem to know a lot, sir, about a farmer's difficulties. May I ask a question about a momentous one?" Certainly," replied the candidate, nervously. "How can you tell a bad egg?" went on the merciless voice. The candidate waited until the laughter died away. Then he replied: "If I had anything to tell a bad egg, I think I should break it gently."

The Burbank Company is experimenting on the dredged lands around Oroville, Butte county, with the idea of establishing extensive spineless cactus plantations.

What are Cattelo?

To the Editor: Can you give me any information about the Cattelo, which is a cross between cattle and the buffalo? Is it true that they will cut up higher than beef cattle, and that they are better range animals? Would there be any difficulty in marketing them as beef? Can range stock be bred up to them by the use of only cattelo bulls? There was an article in the Literary Digest of a few weeks back about the cattelo. Do you know the article in question, and how much truth there was in it?—E. S. S., San Rafael.

The following experience of Charles Goodnight of Goodnight, Texas, appearing in the Journal of Heredity, is probably as valuable as any information available on the subject. He says: "I can summarize my experience in crossing Texas buffaloes with native cattle, as follows:

"I take a male buffalo calf, put him with a native cow and let him suck her until weaning time. I let him run with common cattle until large enough to serve. He will then cross with any kind of domestic cattle. In making the first cross, no male calves have ever been born; cows conceiving them either suffer abortion or die, hence I only get heifer calves and a small per cent of them. There is no trouble whatever in giving birth. The cause of abortion and death is unknown to me. The heifer calves obtained breed readily to either the buffalo or the cattle. When bred to the buffalo, the males, which are three-quarters, are not fertile. The females are perfectly fertile and will breed to either race. I breed them back to the polled Angus stock from which they come, and get males which are fertile and which are half-breeds.

"The type or race of hybrid cattle is now virtually established in a small way and herewith I give you a few of the points of advantage which the "cattleiow" have over common cattle.

"First, they are immune from all diseases as far as I have tested them. I know they are immune from Texas Black-leg and Texas fever. I have shipped three bulls, one-eighth buffalo, to our coast, the worst tick-country we have. One died and two are living, so I have reason to believe that if they were a little higher in the buffalo blood, they would be entirely immune."

See also "Breeding Cattelo" by C. J. Jones, in American Breeders' Association Annual Report, vol. III, p. 161, 1907.

Second, the "cattleiow" are much greater in weight, eat much less and hold their flesh under more adverse conditions. They will easily cut about 70 per cent net of their gross weight. They have a better meat, clear of fibre, and it never gets tough like beef.

They have long and deep backs, enabling them to cut at least 150 pounds more meat than other cattle. More of them can be grazed on a given area. They do not run from Heel Flies nor drift in storms, but, like the buffalo, face the blizzards. They rise on their fore feet instead of their hind feet. This enables them to rise when in a weakened condition. They never lie down with their backs down hill, so they are able to rise quickly and easily. This habit is reversed in cattle.

When a herd on range gets weak and poor towards spring, their lying down with their backs toward slopes and on sides of hills causes a loss of from 1 to 6 per cent. Every weak cow which so lies down can never get up, unless she is found by the herder.

The buffaloes have 14 ribs, giving them a longer and deeper loin. As we get them higher and deeper in the buffalo we get the extra rib on the "cattelow." They can exist on less salt than cattle.

They could do without water much longer than cattle, without inconvenience. They are docile, easily broken and never fight. They put on flesh faster than any cattle and will live and appear to do well where cattle will perish.

found that they had no bearing on the condition.

After several days of like experiences, the milking was delayed one morning until after breakfast, when all of the cows were milked without allowing any interval between times, thus part of the milk was not allowed to stand in the vat before the balance was added, and was drawn immediately after milking into the pans.

The next day, upon examination, the milk was found to be perfectly sweet and the conclusion was arrived at that the animal heat which remained in that milk which was drawn before breakfast was responsible for the clabbered condition in the pans, as the milk was not aerated soon enough after being drawn from the cows.

Further experiments along this line proved that this contention was correct; and after that the milk was

AERATING MILK FOR BETTER BUTTER.

[Written for Pacific Rural Press.]

A retired dairyman recently told of the experience he had many years ago in milk aerating and butter making, which pretty thoroughly establishes the theory that aerating and cooling of milk at the dairy is necessary in the making of good butter.

At the time he tells us of there were about 60 cows being milked on the dairy, the common practice being to milk half of them before breakfast and the other half after breakfast. As is was before the advent of the cream separator, the milk was poured from the pail into setting pans, the cream afterward being skimmed in the pan.

This necessitated considerable work, and resulted in the installing of a large vat inside of the milk room into which the milk was poured from the outside of the building.

Clabbered milk in the skimming pans resulted almost immediately after this new method was introduced and the dairyman was at a loss to understand why such should be the case when he had never before been botherd with it. The pans and utensils were first thoroughly cleaned and sterilized with the idea that possibly they were responsible for the clabbered milk, but it was poured into the settling pan as soon as milked, one man attending to that work and being careful not to mix the two batches.

This dairyman maintains that the aerating process which results from running milk over water coolers diminshes the animal heat to such an extent that good butter making is very much simplified; but does not believe it is possible to make good butter from milk cooled in bulk, such as may often be seen on dairies where the warm milk is poured into a large vessel or 10 gallon can to cool from the outside air.

POINTED SUGGESTIONS ON GOOD CREAM.

[Written for Pacific Rural Press.]

The following communication from W. H. Roussel of Oakland, who has perhaps exerted more effort in educating both the producer and manufacturer to the need of better and more uniform quality in our dairy products, is well worthy of consideration on the part of dairymen, for it is apparent that the co-operation of each and every dairyman is needed along this line in order to successfully market California butter at prices which will keep the dairy industry flourishing:

"A few remedies for the dairyman to follow are herewith suggested and are intended for the best interests of the producer. It is only a matter of time when it will be compulsory for the buyer of cream to refuse any overripe or tainted goods. Everything about a dairy should be sanitary and care taken to keep it in such condition. Cream should be kept cool by the producer until such time as it passes into the hands of the manufacturer of butter. To do this, one should be provided with a tank or vat which should be filled with cold water in which the cream should be placed in cans only half full. Be sure to stir the cream thoroughly at least every two hours, thus keeping it smooth; never mix the different separations until they have each been thoroughly cooled, and when mixing see that they are properly stirred after mixing. Do not keep the covers on the cans while cooling, but place a piece of fly screening over the top of each can to keep the flies away. Deliver the cream every day if possible, never later than every other day, even during the winter months. If you find that a buyer of cream is paying you for good cream the same price that he is paying for poor cream, you have just cause for complaint. One who produces poor cream has no grounds to complain, and he should be satisfied with any old price offered for his product. Cream for churning should be 35 per cent at least to insure its arriving in good shape."

A plate of Gravenstein apples from Sebastopol took second prize at the convention of the International Apple Shippers Association recently held in Chicago, with 2300 plates on exhibition.

Classification for Rio Vista Horse Show.

[Writtea for Pacific Rural Press.]

That September 9 will be a gala day for horse men at Rio Vista, Solano county, seems assured from reports we have received together with prize list and classification for the Horse and Colt Show which is to be held there.

Through the aid of business men and horse breeders the committee on finances has been able to raise a large sum for prize money, the Board of Supervisors of Solano county alone donating $500.

Premium money amounting to a total of $442.50 is offered, besides six free service fees of local stallions. Eight classes are provided for; classes number one, two and three being for purebred and registered Percherons, Belgians and Shires. The prizes for each of these breeds are as follows: $10 for best stallion over four years old; $10 for best three-year-old stallion; $10 for best two-year-old stalilon; $10 for best one-year-old stallion; free stallion service for best stallion foal; $7.50 for best mare over four years; $5 for best three-year-old mare; $5 for best two-year-old mare; free service fee of local stallion for best filly foal; $10 for best mare and foal; ribbons to be awarded as second prizes.

Prizes for grades are as follows: $10 for best mare four-year-old; $5 best three-year-old mare; $5 for best two-year-old mare; $5 for best yearling mare; $10 for best mare and foal; $10 for best mare and her get; $5 for best foal either sex; $10 for best three-year-old gelding; $10 for best two-year-old gelding; $10 for best yearling gelding; $10 for best mare and two of her get.

Class number five provides a first prize of $15 and a second prize of $10 for the best and second best three animals any age, either sex, the get of one sire, it being compulsory that the sire be previously shown in his class. A $10 prize is offered for the best mare and two of her get, mare to be purebred and previously shown in her class.

Class number six provides $10 for best jack and three of his get; $5 for the best jack and $5 for the best mule foal.

Class number seven is the harness class, prizes being $10 for best four-horse draft team hitched up; $5 for best pair of draft horses hitched up; $10 for best four-mule team hitched up and $5 for best span of mules hitched up.

Class number eight provides a $10 prize for grand champion stallion limited to first prize winners in their respective classes; $5 for best foal irrespective of breeding; $10 for best three foals owned by one man and $5 for second best three; $5 for best draft gelding 1700 pounds or over; $5 for best mule on grounds 1400 pounds or over; $10 for grand champion mare irrespective of breeding but limited to first prize winners in the various classes.

When there is but one entry in a class but 50 per cent of the premium money will be paid. All stock must be in show condition and entries must be in the hands of Secretary Dr. A. F. Hanna of Rio Vista not later than September 1. No entry fee will be charged and competition is open to the State.

The committee on amusements promise a good time to all visitors, and it seems probable that every farmer in Solano and adjoining counties as well as many interested parties in other parts of the State will be present.

WHY DAIRY COWS ARE POOR.

[Writtea for Pacific Rural Press.]

Why is our average butterfat production so small? Let us print a conversation that was recently overheard in a country just starting to dairy and then guess at the reason.

Farmer A was at Farmer B's ranch trying to buy some alfalfa hay. Farmer B had a heifer tied up in the barn. Farmer A said: "A calf, eh? Let me sell you a heifer. I have one about that size, a Holstein, and another sort of a mixed colored one about a year old that will soon be old enough to breed, and she's a daisy. Got her along with a bunch I brought in from Washington last winter. Got a dandy bunch of young bulls, too. Sold three here lately to Farmers C, D, and E." The writer: "Are they purebred bulls?" Farmer A, "O, sure." The writer: "Registered?" "No, not registered," he replied, "but their mothers were thoroughbreds and their sire, too." The writer: "Either their father or mother registered?" "No," he shouted, "but what in tarnation do you care for, anyway? I don't care whether a bull or cow is registered or not as long as they are thoroughbreds. My cows are better than any of these fancy registered ones." "How did you find that out," we asked; "by testing and weighing your milk?" "Well you sure are a smart Eleck," he replied. "Do you suppose I don't know how good my cows are when I milk them twice a day myself?" "Do you take the Pacific Rural Press?" we inquired. "Nope," was the rejoinder; "there's been two or three fellows around here trying to get me to take it, but I don't have time to read. By the time I get the cows pailed and the chores done up it's time to roll in, and I'm busy all day." "Serves you right," we replied, as he drove away as we thought of the time and money loss he had caused C, D, and E, by getting them to use scrub bulls.

The farmer A class who is selling scrub bulls to new settlers as in this case is the big reason that our average production is low. His wares should be shunned like a case of smallpox by the farmer who would make money from dairy cows.

CARE IN FEEDING MILK TO HOGS.

[Written for Pacific Rural Press.]

A Yolo county dairyman called for help, for his pigs were lank, sick, and coughing. They were found to have tuberculosis, having been fed skim milk from tubercular cows. These pigs were killed and their carcasses found rotten with the disease. The milk from the cows has since been pasteurized before feeding to the pigs and the new lot of pigs is as thrifty as could be desired.

It is stated that during the last ten months, the United States has exported horses to the warring nations to the value of $60,000,000.

The apointment of a county veterinarian is being urged by stockmen for Humboldt county. H. A. Perry, President of the Humboldt County Dairymen's Association, will appear before the next meeting of the Supervisors, setting forth the need of such an officer.

100 HEAD 100

Complete Dispersion Sale

OF THE

HOLSTEIN-FRIESIAN HERDS

of T. J. Gilkerson, Lemoore, and Heenan & Weldon, Sacramento, to be held at

Hanford, September 15th

80 head of cows and heifers, bred to the best young bulls in the West. The two herd sires, Juliana De Kol King Segis and Prince Gelsche Walker Korndyke, will be sold. Never again will the public be offered an opportunity to buy two bulls bred like these.

18 Granddaughters of the great sire King Segis.
6 Granddaughters of Pontiac Korndyke.
3 Daughters of Admiral Burke.
9 Daughters of cows with records of from 15 to 25 pounds butter.
2 A. R. O. cows, one of whom has an A. R. O. daughter.

Several cows that are capable and will make A. R. O. records up to 30 lbs. The best bred and the best type of Holsteins that will be offered at the Fall sales.

20 young bulls from A. R. O. cows and sired by bulls from the Korndyke and King Segis family. 12 of them past yearlings ready for service.

Taken altogether, it will be a quality sale.
All animals over six months old tuberculin tested.
Catalogues will be ready about September 1st.

DAIRYING.

The purchase of 106 acres of land and a herd of 35 dairy cows was recently made by W. A. Miller from F. P. Griffith of Tulare.

The recently organized Napa Cow-Testing Association now has 925 cows signed up, and work in the county will begin Sept. 1.

A. L. Harlow of Montague recently purchased 140 head of cows and heifers and expects to engage in dairying in an extensive way.

The purchase of 480 acres near Woodland was recently made by John Vierra of Hanford from W. B. Jennings. The new owner will engage in dalrying and stock raising.

The Shore Acres Dairy of Alameda county are getting a nice start in Guernseys, having sixteen head at the present time. They recently installed a Sharples Milking Machine.

J. J. Furrer of Pleasanton is milking 65 head of cows this season, selling the whole milk at 16 cents a gallon. He's not talking hard times.

F. H. Stenzel of San Lorenzo reports the testing of two daughters of his senior herd sire, Sir Peiterije Bests Segis. A junior two-year-old, Estudilla Korndyke Ormsby, produced in seven days 19 pounds butter, and her half sister, Estudilla Fanny De Kol, also a junior two-year-old, made 17 pounds in seven days.

The Point Reyes Co-operative Creamery is planning to buy farm milk coolers wholesale and sell to stockholders at cost. A number of members have already signified their intention to get one each. This creamery has declared a 10 per cent dividend which represents less than one-third of the profits from its first six months of business.

The California Jersey Breeders' Ass'n, in their meeting at Modesto, Aug. 14 took action postponing the Annual Futurity Contest until 1916 at the State Fair at Sacramento. The animals entered for this year's contest will be held over until next year and will enter the contest as three-year-olds. The regular two-year-old class will be held next year as already provided for. The next annual meeting of the Association will be held at the Exposition during the Dairy Show.

N. H. Locke & Company of Lockeford have now nearly 200 registered animals. They are at present milking 75, all of which are on official test. The following is some of the work of a few of their cows: Moryet 3rd, a 4 year old, during May 79.90 pounds fat or 99.87 pounds butter, figuring 80 per cent fat or 20 per cent over churn; Foxy Blondy of Lockeford, 3 year old, 63.30 pounds butter, figuring 20 per cent over churn; Dairy Maid of S. B., 5 year old, in five months produced 288.063 pounds butter, figuring 20 per cent over churn; No. 135 in 7 months produced 429.74 pounds butter; Dairy Maid's Lassie of Lockeford, 4 years, 330.05 pounds butter in 7 months; Valets Golden Biddy of Lockeford produced 371.28 pounds in 7 months.

CATTLE AND SHEEP.

P. R. Peterson of Maxwell recently shipped 30 cars of sheep to a San Francisco meat company.

Two carloads of beef cattle were recently sold by Mulqueeney & Inman of Alameda county to a San Francisco firm.

A band of 1500 sheep is being moved by Patrick Connolly of Alameda county from the Carneal Ranch to the Byron Tract.

Two trainloads of sheep were recently shipped over the Western Pacific from Elko county, Nevada, to a San Francisco firm.

Four hundred ewes at $6.50 a head were recently sold by Peter Moy and Patrick Connolly of Alameda county to a Stockton sheep man.

Frank Ellingwood recently purchased 640 acres in the Shelter Cove section of Humboldt county, on which he will engage in the cattle and hog business.

Stubble feed in the vicinity of Livermore is reported to be exceptionally cheap this year, sheep men paying 6 cents a head in the river bottoms.

It is reported that a large Chicago packing company recently received a cable from England asking an estimate on 1,000,000 head of American beef cattle cash on delivery at Liverpool.

Miller & Lux have recently purchased from W. M. Carruthers five registered Hereford bulls to breed on 100 purebred Hereford cows, recently added to their herds. This firm also purchased a registered Shorthorn bull to head their herd at the Colony Farm.

HORSES AND SWINE.

R. S. Irwin of Modesto has 12 head of horses training on the Pleasanton race track.

Four cars of cattle were recently shiped from Woodland to Mahoney Bros. of Merced county.

The River Bend Farm of St. Helena has just placed four of its registered Duroc boars on the market.

J. W. Wakefield of Acampo has entered the Poland-China game, his foundation stock having been secured from W. A. Young of Lodi.

Mr. Gates of Brentwood recently sold two young Berkshire boars, one to Mrs. Bayston of Susanville and the other to Ames Melcher of Oakley.

W. A. Young of Lodi recently sold an 8-months-old Poland China boar to J. W. Pyers. Mr. Young intends to take his show herd to the Exposition this fall.

J. F. Dunn of Morgan Hill moved three colts to the Pleasanton race track to train. Since arriving, one two-year-old trotted the mile in 2.18, and a two-year-old paced it in 2.20.

The Whitehall Ranch of Tracy have a hog population of 3484. Of this 1000 are grade brood sows, 25 registered sows, 45 registered boars, and the balance are mostly stock hogs ready for market in November.

The French Government has authorized their agent at Reno, Nevada, to secure 35,000 cavalry horses within the next few months. He expects to fill the order in Nevada, paying stockmen approximately $3,500,000.

C. W. Ridley recently purchased the Smith ranch at Oaklay where he has a fine bunch of registered Poland China and Berkshire hogs. This is one of the few ranches in Contra Costa country where alfalfa is grown beneath the almond trees.

W. M. Carruthers received from Ames, Iowa, recently a car of 31 head of Berkshire hogs. Of this number, there are now eight in the view herd at the Panama-Pacific Exposition. Thirteen head went to Riverside and the balance went to other breeders.

It is reported that cholera has made quite a start among the hogs on the tule lands west of Stockton. A great many of the ranches in that section as yet free from the disease have signs up warning parties from infected places to keep of their farms.

Roseville, Placer county, is the assembling point for mules being purchased for the English Government. From that point they will be shipped to Lathrop, Mo., the world's largest horse camp, where there are now more than 27,000 horses and mules being cared for.

Three sows and one boar were recently purchased by J. B. Thorpe of Stockton from the great Browning show herd of Hearsman, Ill. Mr. Browning reserved the privilege of showing them in the eastern fair circuit and the Panama Pacific Exposition. As there is perhaps no herd in the United States that is better known than the Browning, California may consider itself fortunate that some of this stock is coming to the State.

A. H. Brinton of Woodland called at this office this week and informs us that the 8 gilts and the boar, Symboleers Duke, which he brought from Illinois last fall just before the foot and mouth disease quarantine was placed on out-of-State shipments, are doing exceptionally well, and that the fall litters are now being farrowed. Mr. Brinton states

Copro

Cocoanut Oil Cake Meal In Its Purest Form

Be Sure the Copro Brand Is Stamped on Every Sack

Copro contains 16.4% Protein, practically all digestible, consequently the percentage of waste in assimilation is small. Because of this fact it is the most economical food to buy for Dairy Cows, Hogs and Poultry. Place your order now.

W. H. HORD

Live Stock Auctioneer

Sales conducted in all parts of the State. Twenty-six years' experience. Write for terms.
LINDEN STOCK FARM — Horses, Mules, Shropshire Sheep, Berkshire Hogs for sale.
704 Market St., San Francisco.

that he expects to keep in the neighborhood of 10 brood sows on his ranch and will specialize on hogs and Jersey cattle more extensively than he has in the past.

A swine show to be held sometime in November at Lemoore is under consideration by the members of the Boys' Pig Club of the agricultural department of the Lemoore Union High School. At present the members are engaged in a feeding contest under the auspices of the University.

MISCELLANEOUS.

Following fresh outbreaks of the foot and mouth disease, the Union Stock Yards at Chicago were again placed under quarantine.

T. J. Maynards of Hayward has a fine herd of 40 milch goats, 18 being registered Toggenbergs and the balance high grades of the same breed. He states that they give one to six quarts of milk daily.

It is the intention of Kings county breeders to make that county a central point for purebred auction sales, and many fine stock sales of that character are being promoted for the fall.

Sixty-six squirrels were killed by J. B. Thorpe last week while irrigating a piece of alfalfa. Whatever Mr. Thorpe does, he does with all his might, whether it be breeding Jersey cattle, Duroc hogs, or killing squirrels.

The H. B. Goechen ranch of Contra Costa county was recently visited by the Pacific Rural Press representative, and a fine lot of registered Berkshire hogs and Holstein Friesian cattle were found. Mr. Goechen is one of the oldest Holstein breeders in the State. Burbank spineless cactus has been planted on three acres of this ranch, and last winter over 150 tons were cut and fed to the hogs and cattle.

FRESNO TO HAVE BIG FAIR.

The premium list for the Fresno District Fair, which will probably be the only District Fair held in the State this year, has just been issued by the directors.

The date of this year's fair has been set at Sept. 28 to Oct. 2, and in line with their annual progress which has been characteristic for the past few years, a material raising of premiums has been made.

In the livestock division, beef cattle classes have been raised from a little over $200 to $286, Shorthorns, Herefords, Angus, and Red Polls being provided for. Dairy cattle classes show the same increase in prizes, Holsteins, Jerseys, Guernseys, Ayrshires, Dutch Belted, and Brown Swiss being afforded individual classes.

Under swine classification, Berkshires, Poland Chinas, Duroc Jerseys, Tamworths, Hampshires, Mulefoot, Essex, and Small Yorkshires are offered prizes totalling $107 for each breed.

Shropshire, Spanish Merino, Rambouilette, Southdown, Persian, Cotswold, and Hampshire sheep are offered $85 for each of their respective breeds.

A total of $199 is offered each of the following breeds of horses: Percherons, Shires, Belgians, Clydesdale, thoroughbreds, and standard breds. Prizes for grade horses aggregate a total of $160, colt prizes $52.50, and mules, jacks, and jennets, $263.50.

Poultry and Pet Stock will as usual be a big feature of the fair, liberal premiums being provided for the various divisions and classes.

Horticulture, woman's department, educational department, viticulture, automobile, and farm implements are all provided for in a most liberal manner.

As special free attractions, the directors have made plans for a historical pageant at a cost of $15,000, which will be held Tuesday, Wednesday, Thursday, and Friday, which will show all of the features of early-day California. Saturday will afford thrills to visitors with a 150-mile auto race for a purse of $5000.

Intending exhibitors should write at once to C. G. Eberhart, Secretary and Manager, Chamber of Commerce Bldg., Fresno, for entry blanks and premium list.

THE CALIFORNIA HOG BUSINESS.

"Whenever the demand for a product exceeds the supply, the business of producing it should be on a safe basis as far as marketing is concerned. This is the situation as regards the production of pork in California," says W. S. Guilford, Director of Agriculture of the Sacramento Valley Irrigation Co. at Willows in Glenn county, and an authority on hog growing, who has made a close study of conditions in the State.

"We are consuming much more pork than we produce," he continued, "and while exact figures are not available, population is undoubtedly increasing faster than the production of hogs.

"This makes a bright business outlook for those who are in the business, have good breeding stock, comfortable, convenient and sanitary quarters, and plenty of good feed; and for any who may engage in it similarly equipped."

Moving pictures and phonograph records for the rural schools, to be supplied by the State, for use in school work and community gatherings, is a recommendation of the State Board of Education in its first biennial report just issued for distribution to those who ask the Board for them.

Copy for the new "California Hog Book" has been given to the printer and the pictures to be used to illustrate are in the hands of the artist. The book will be of great value to the swine industry and will be ready for distribution sometime in September. Price $2 postpaid.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

DAIRY CATTLE.

REG. HOLSTEINS—We offer choice grandsons of King Segis, also grandsons of the world's record cow. Creamelle Vale; blood that increases the value to your herd. Write or call and see our herd. F. H. Stenzel, San Lorenzo, Cal.

WANTED — 150 or more stock cattle. Mostly heifers two and three years old. State price. Peter Heitman, Yerrington, Nevada.

BREEDER of Registered Holsteins and Poland China Swine. E. E. Freeman, R. 5, Modesto, Cal.

Veterinary Queries and Replies.

[Answered by Dr. H. H. Wintringham, Petaluma, Cal.]

OVER-FED CALF.

To the Editor: I have a little calf 4 weeks old. Every time it gets a cud in its mouth, it splts some of it out. She is nice and fat and is growing well. She gets milk and green alfalfa every day.—S. S., Chico.

Don't feed this calf so much.

ACNE, A SKIN DISORDER.

To the Editor: I am sending scabs from my horse. Please tell me what the disease is and what to do for it.—J. L. R., Los Gatos.

This is Acne. Give Fowler's Solution of Arsenic in ½ oz. doses three times a day and give plenty of cooling substances in the diet, such as bran, greens, etc.

WOUND WITH "PROUD FLESH."

To the Editor: I have a colt three years old which pawed into a barbed wire fence last March. She nearly cut her front hoof off. I took her up in the stable and immediately bandaged the foot. The cut filled out slowly, but as soon as commenced to heal she also started in to gnaw the heel of her foot near the cut. I tied her head up so she could not reach it any more. The cut healed up nicely, but where she gnawed it never seemed to heal. It formed a soft scab and whenever you touched it it would slip off. I called on a veterinary and he told me to burn it with a hot iron. It then seemed to dry up. A week after I burned some that was still raw. Afterwards it healed up pretty well. Two weeks ago I turned her in a small lot for exercise, as she had been tied up for five months, and after a few hours she had her foot raw again, a spot the size of a silver dollar, and every chance she gets she rubs it with her nose.—R. M. M., Loomis.

This trouble is due to proud flesh. Tie the colt up so she cannot get at it with her mouth and keep her tied up until healed. Paint the raw place with the following three times daily: potassium permanganate 4 drachms, water 8 oz. Shake well before using.

COW POX AND HEN BLINDNESS.

To the Editor: I bought some calves from a dairy and put them on my wet cows. The cows since then have broken out with udder boils and pass pus with their milk. These boils swell, come to a head and after being lanced dry up and disappear. Can this be cow pox? The dairy was at one time infected.

One of our hens set for about two weeks and then went blind. She is free from lice and was setting in a cool place free from draughts. Her eyes are as clear as ever. As she is a pet and a fine Minorca we are anxious to save her. Can you name the reason and suggest a remedy for her blindness?—W. A., Brown's Valley.

This is very probably cow pox. Use mild antiseptics to wash the udders daily.

Your hen's blindness is due to nervous trouble which is sometimes caused by change in blood pressure from long changes in attitude. Give her nourishing food and wash the eyes and head daily with a saturated Boric Acid solution. As to whether she recovers will depend on how badly the nerves have been damaged and this will take time.

A CASE OF GARGET.

To the Editor: About six weeks ago we noticed that after the butter had been made about twenty-four hours from our cows' milk it had a bad odor and taste. This has grown worse until now the milk smells and tastes bad when milked. The milk looks all right, but when stralning lumps gather on the strainer which nearly stop the flow. These lumps look something like those seen when cow is about dry. The cow eats well and seems in fine condition.—E. A. S., Ontario.

This is Garget. Give the animal potassium iodide in two-drachm doses three times a day for one week, then skip a week and give the treatment again for one week.

SCABS ON RABBIT'S EARS.

To the Editor: I am enclosing herewith scabs from rabbit's ears for analysis, so you may tell me the trouble and treatment. — E. P. O., Livermore.

This is the Psoroptes Communis vari Cuniculi. Lime-sulphur wash is a specific for this trouble.

HORSE URINATION.

To the Editor: My horse, five years old in August, weight between 1300 and 1400 lbs., will get into the position of urinating from one to five or six times previous to urinating. I thought it might be the beginning of a habit as it first came to my notice while working him, but by watching I discovered that he also does the same when out of harness. This is the same animal for which Dr. H. B. Wintringham prescribed an ounce of saltpetre in the feed twice a day, some few weeks ago. Will you kindly ask Dr. Wintringham whether or not I should continue the saltpetre treatment and for how long? I gave the horse the treatment for over two weeks, as the first week's treatment did not bring results, or will the doctor prescribe again?—R. H. M., Orangehurst.

Discontinue the saltpeter and give the following: Urotrepin 4 oz; Sodium salicylate 4 oz; Sodium Benzoinate 4 oz; Fluid extract Uva Usi 8 oz.; water enough to make one pint. Give one ounce three times a day.

CAKED UDDER.

To the Editor: I have a cow freshened the 23d inst., 9 days overdue, but as yet gives no milk, or only about a quart at a milking. She is 8 years old, runs in pasture and gave 5 gallons a day all last season. She had no trouble of any kind at calving and is in good health and fat.—A. V. S., Santa Rosa.

This is most probably due to caked udder. Massage the udder for at least 15 minutes night and morning. Give two-drachm doses potassiuu iodide in two ounces water twice a day on an empty stomach.

NEEDS TEST FOR TUBERCULOSIS FIRST.

To the Editor: I have a cow that seems to breathe very rapidly, especially in the heat of the day. The milk when clabbered is very slimy and sticks to the bottom of the milk pans. She has plenty of shade and lots of water, and we feed alfalfa only.—M. J. S., Morgan Hill.

Have this cow tested for tuberculosis. It will be time enough to treat her for other trouble if she does not react to the tuberculin test.

CONTAGIOUS ABORTION.

To the Editor: I have Jersey cows that have lost calves and I cannot get them with calf again. Some of them will come in heat regularly and others will go for two months or more before coming in heat. The calves aborted were nearly mature. What is the cause and remedy? Am afraid it is contagious abortion.—R. R. T., Turlock.

This is Contagious Abortion. Read article appearing in the January 9th issue of this paper on this subject.

BOVINE TAPE WORM.

To the Editor: I have a six months old heifer calf which I have raised by hand. I discovered her walking around the corral with a queer tape hanging out of her rectum. I took hold of it and pulled it out about 2 more inches when it broke off. There are two of them, the longest one trailing on the ground.—J. E., Oakville.

This is bovine tape worm. If you did not thoroughly disinfect your hands after handling the worm you stand a very good chance of having infected yourself. Give the cow the following: Oil of turpentine, 3 oz.; oleoresin of male fern, 1 oz.; raw linseed oil, 1 quart. Give this at one dose and repeat in one week if necessary.

There is a Big Difference in SILAGE

THE SUCCULENCE and PALATABILITY of perfect ensilage produces maximum results at a low feeding cost.

NO OTHER FEED contains as much "succulence value" as well preserved ensilage.

IT IS THE MOST ECONOMICAL FEED for summer as well as for fall and winter.

BUT THERE IS AS BIG A DIFFERENCE in silage as there is in silos.

AN ABSOLUTELY AIR AND WATER-TIGHT silo is needed to produce good silage.

IT MUST NOT LEAK OUT THE JUICES or admit the air to the silage.

TO MEET THESE REQUIREMENTS, a silo must be of such design, material and workmanship that it will be for many years just as serviceable as when first erected without its being necessary to rebuild every year.

THE IDEAL GREEN FEED SILO will keep ensilage as fresh and succulent all the year as the day the corn was cut.

ERECT AN IDEAL GREEN FEED SILO and stop silo troubles forever. Built of California redwood; it will last a generation.

Silo Types and Filling.

Tho the Editor: Will you kindly advise me as to silos? I am thinking of putting up a home-made silo, made from two by four, rapped by half inch and then lined with the building paper, then rapped once more with half inch lumber. This will cost me about $100 less than a stave silo. Now what I want to know is do you think it would be as good as a stave? One party said the air gets into a stave silo and had lost cows from bad silage, also will you tell me how to fill a silo? This is a dry climate here.—D. J. A., Esparto.

[From our observation of silos in the interior valleys we do not believe that the resaw and studded type is the one best suited for permanency. It is true that a great many of them have been erected and very often their owners are well satisfied with them. This is due we believe to the fact that loss of silage is not fully taken into consideration or that they have not been used for a sufficient length of time to tell what the ultimate results are. The constant shrinking and swelling which occurs in sections having long dry summers and wet winters is certain to cause checking and cracking in lumber which is nailed rigidly. In time these cracks and checks let in a certain amount of air and in this way considerable spoilage results.

Providing the stave silo is made by some reputable silo firm, and not simply a by-product of some local lumber dealer, who has not given the subject of construction any particular attention, there is less likelihood of spoilage in this type if the hoops are loosened and tightened at the proper time. For a permanent silo we should prefer the stave type. It was very likely moldy silage which caused your neighbor to lose his cows and this would not have happened had his silo been perfectly tight when filled and the hoops gradually loosened as the need arose.

In filling your silo you will need a mechanically driven silage cutter with blower attached. Adjust the knives to cut the corn about one-half or five-eighths inch long. Cut the corn as soon as the ears begin to glaze, between the milk and ripe stage. Use a corn binder, knife, hoes or other tools which will cut the stalks close to the ground. Haul the corn to silo on wagons, two or more being advisable as there is less loss of time with more wagons; cut and haul the same day when possible. When filling is started see that all of your silo doors are securely fastened and air tight. The blower spout enters the silo at the top from which a loose jointed spout can be attached, extending to within a few feet of the bottom of the silo. One man should work inside of the silo, (and it would be better to have two) distributing the silage with pitch forks. Direct the spout around the outside edge till it is built up three or four feet higher than the middle. Carefully tramp the silage along the outside edges, as this is where the air will enter and the closer the silage is packed the less chance there is for spoilage. After building up the edges allow the spout to run in the center till a pyramid bas been built there, and then build up the sides again. It is not necessary to tramp the middle as the natural settle is sufficient, but be sure that a good job is done on the edges.

If the corn is not too far advanced the addition of water is not necessary, but to be on the safe side many prefer to have a half-inch hose full of water running into the cutter all of the time. The additional moisture does not do any harm and may insure good silage if the corn is a little past the proper stage. To prevent an unduly large amount of spoilage on top of the silage put a thick layer of straw on. This will exclude a large amount of air till feeding is started. Filling need not be continuous if you remove all damaged silage from the top before again starting again.—Editors.]

MANGY PIGS.

To the Editor: Can you tell me a good remedy for a kind of mange in pigs? Their skins seem to get thick and wrinkled and itchy, the hair standing straight and mostly falls out.—Subscriber, Thalheim.

This is mange. Make a dipping tank and dip these pigs twice a week in a 2 per cent solution Liquor Cresolis Compositus covered with ½ inch crude oil twice a week.

WASH AGAINST FLIES.

To the Editor: Will you please tell me how to make a good spray that will keep the flies off and leave the hair on horses?—R. E. C., Sebastopol.

Fish oil, 1 pint; Liquor Cresolis Compositus, 4 oz.; Neutral oil enough to make one gallon.

Dairy cows in the vicinity of Dinuba were reported free from disease after careful inspection by the State Dairy Inspector and the County Veterinarian.

THE TWO GREAT SALES!

COMBINATION SALE!

A. W. MORRIS & SONS, Corp., Woodland.
McALISTER SON, Chino.

State Fairgrounds, Sacramento, October 6-7, 1915

175 REGISTERED HOLSTEINS 175
Tuberculin tested.

Far and away the Greatest Sale ever held in the West and in respect to Individuality and Yearly Records the Greatest in the World.

COWS:

The sale consists of about 50 advanced registry cows with records as high as 31 lbs. butter in 7 days, and include a large number of cows with large yearly records. Many are daughters of some of the greatest sires of the herd.

HEIFERS:

There will be close to 100 heifers in the sale and nearly all from tested dams. Included in this number are ten daughters of King Segis Pontiac Emperor, senior herd sire of A. W. Morris & Sons, ten daughters of Lorena Korndyke, winner at State Fair for 4 consecutive years; twenty daughters of King Pontiac Topsy, one of the best sons of King of the Pontiacs; and five daughters of De Kol Hengerveld Burke.

BULLS:

The most extraordinary lot of bulls ever offered at public sale will be sold, including **King Segis Pontiac Emperor,** Senior Herd Sire of A. W. Morris & Sons and the best bred son of King Segis Pontiac, sire of the $50,000 bull and $20,000 bull calf. **Lorena Korndyke,** the great show bull, a son of the world's champion cow for two consecutive years as a 3 and 4 year old, son of a 31-lb. cow, and son of a cow with a yearly record of over 1000 lbs. butter—and many other bulls of lesser merits—all out of high record dams.

A FORTUNE!

The calves out of the cows and heifers will represent a fortune, sired by sons of Tilly Alcartra and Riverside Sadie De Kol Burke, who hold every world's milk record from 7 days to 3 years, Aralia De Kol. the first cow to make 28,000 lbs. milk in 1 year, and King of the Pontiacs.

TERMS:

This should attract you: $500 and under, cash; over $500, one-third cash and balance in 3-6-9 months, with bankable paper and 8% interest. 3% discount for cash will be given for cash on time sums.

Farm Poultry for Profit.

Written for Pacific Rural Press by Susan Swaysgood, Pomona

CHICKEN CHATTER.

At this time of year there is not so much need of a long sermon as there is for a few pertinent remainders to keep folks not from backsliding, but from forgetting.

Hens for Next Year.—Almost everybody has swatted the rooster, or moved him to bachelor quarters. Those who are thinking of the present dime, forgetful of the future quarter, are putting their breeders through a forcing period by cramming them to get extra eggs. I believe in a generous diet during the molt, but I don't believe in forcing hens that are to be kept over for another year, either as layers or breeders, because they will retaliate and be shy on laying just when you need them. So it is a good idea to see that the hens have plenty to eat, green feed included, plenty of fresh water and air, and let well enough alone without giving too much stimulating feed to force eggs, unless the hens are to be disposed of later.

Culling.—This is a good season of the year to do a good job in culling both with old stock and young. Of course with young stock you will merely go on health and vigor, looks and disqualifying marks. But with the old stock that you have been handling a year or two, there has been time to notice nearly all their shortcomings.

To be a good useful hen, of any breed, there must be certain traits that will be noticeable, also a certain amount of intelligence; a stupid hen never amounts to anything except to fatten for table purposes. A hen with good intelligence can always be relied on to be a good layer, a good setter and mother. A stupid lazy hen does not know enough to go in out of the rain, eat her feed properly without tramping it under foot, nor does she actually know how to go to bed right. As a rule you will find her slumped down on the ground in a corner, and if you pick her up and put her on the perch, she is too lazy to grasp the perch with her toes and slumps down again. If you venture to give her a setting of eggs she sprawls all over them and you will find eggs all over the nest—what she does not break. An intelligent hen will draw the eggs under her in as nice a compact nest as possible and sit on them lightly, because her brain has a spark of light that tells her she is setting on eggs, not on paving stones. These little things can all be learned by observation by anybody who takes the time, and they pay big interest. It need not be "how many chickens can I keep on a certain amount of land," but how many chickens can I make keep me if I give them proper care and watch the little things.

Midsummer Madness.—In Los Angeles a land and investment company are hiring what they call successful poultry women to give free lectures; of course the investment company pays the lecturers, to tell marvelous stories of fortunes to be made on one and two acre poultry farms.

We have plenty of good laws in this State, but there does not appear to be any law to prevent people from exaggerating. One woman tells that she made $14,000, in one year from one acre of poultry. Now I am awful sorry that I did not take lessons from that woman years ago, because if that is true, look where I could be now in finance. It almost, not quite, makes me jealous. Why, instead of working in a poultry yard now I could have a limousine and hire a chauffer to drive me around. I would not even need to lecture. Such statements won't bear investigating, but some people are sure to be led away by them and have to learn from experience that "all is not gold that glitters," even in chickens.

Waste in Feed and Foodstuffs.—I lately bought a few sacks of mash feed that contained so much dirt that when water was added it showed nearly black.

If I had not moistened it and the chickens had eaten it—well, it would have passed undetected, but the fact that the young stock did not eat it up clean caused me to moisten it and then I found why they had not eaten it up with a relish. Of course, being ground up it was not easy to detect, and all millers use up their sweepings, so it happened that I got considerable sweepings. Now feed is too high to pay for sweepings; and we get it in grain too, which makes quite a big loss. There is but one way I can see out of this and that is to patronize the feed men who give us nothing but clean feed and grain. If we pay 2 or 2½ cents a pound for wheat and get from ten to fifteen pounds of dirt in the sack it is going to cost over 3 cents.

About Shrinkage.—Sometimes it is a good thing to know a few things about the shrinkage of poultry in transportation. I recently shipped a coop of hens, 24 in count, of which the net weight was, when they left Pomona, 160 pounds. They had no food since the night before and were caught out of the yard in early morning and shipped on 7 a. m. train. The firm the hens were billed to got them about noon, making the time between feeding and arriving there about 17 hours and the shrinkage was just five pounds for the 24 hens.

I never feed the day I ship when they are going to market, counting it just loss, because the buyer knows if they are full of feed and in making his deductions for shrinkage, be sure he will allow enough to cover the feed, so you are paying express on weight you will never be paid for. There is nothing new under the sun; men are always up to all the schemes other men can think up to cheat with, and it is simply another case where honesty is the best policy. This coming week I am going to ship some broilers to San Francisco and in that case will feed before starting them because of the distance and time it will take to reach their destination. Naturally all food will have passed through them before arriving at San Francisco and the shrinkage will be a little more than it would be to Los Angeles, but at present quotations that loss will be fully covered by the difference in price.

About Incubators.—This is a good time to clean up all the incubators that have been in use, also brooders that are done with for the season. One young lady wrote me that she hatched ducks in an incubator last year and that she really thought she never would get it sweet again, but she bought a copy of "California Poultry Practice" from the office. and her incubator is now as good as

BUDS OF NEW, RARE AND COMMERCIAL Fruit and Nut trees for sale. Tribble Nurseries, Elk Grove, Cal.

new, so she was well pleased with her investment of $1 if she only got the one item out of it. And by the way, a great many are writing me that they are saving many dollars by having that book. This is not meant as boasting, but just to tell you the truth of what people are telling me, and of course I am glad of it because that was the leading idea in mind when I undertook to write it. All we can do is to be as helpful as we can in this world, then we never need be afraid to step into another when the times comes; our credentials will go with us, and it's a jolly good thing we are not allowed any baggage, only just our credentials or passport, for if extras were alowed there would spring up monopolies and trusts. An old proverb says: "The world goes round as if on wheels, and death is a thing that every one feels; If life was a thing that money would buy, the rich would live and the poor would die."

This is California year sure enough, for almost everybody and his uncle are visting the Fairs, and throwing bouquets at Los Angeles to make up for her loss of not having a Fair. And that's right too, for Los Angeles is a nice town and an awful busy one too. And while there is not any particular place quite up to Petaluma for numbers in chickens, there are some good-sized poultry plants at some of them, and most all run on sanitary principles that insure a good healthy flock. I don't think the White Leghorn is so much in evidence in the southern part of the State as in Petaluma, for most all keep more than one breed, a fact that proves more for the other breeds than any other thing they could do. It is in fact good business to have more than one variety if one has room and can give each the special care needed for success.

Grapes and Chickens.—Do grapes hurt chickens—that is, do they stop the hens from laying? If hens are turned on green grapes and they eat any quantity they will certainly stop egg production. Green grapes are about as sour a fruit as we can imagine, and any amount of acid no matter what fruit it comes from will hurt egg production. If the hens are well fed and have other green feed, they will not eat enough of the green sour grapes to hurt them, but if you are not feeding other green feed it would be advisable to shut the hens out from the vineyard.

GREEN LADYBIRDS—TURKEY FOOD.

[Written for Pacific Rural Press.]

Turkeys to eat the green lady bugs (diabrotica soror) are used by Thornton Glide of Yolo county to protect low-growing crops from green ladybirds and are suggested for use in corn fields where these diabroticas injure the corn grain yield by eating the silks. They are so bad in the fork of the American and Sacramento rivers that corn growing has been practically given up, though it is otherwise one of our best adapted sections. A lot of turkeys would enable corn to be raised to feed to hogs which the new settlers are introducing into that reclamation district, and would provide a neat source of income next holidays.

Why a Balanced Ration is Necessary.

[Written by Geo. H. Croley.]

To make hens profitable as egg producers, they must be fed with not only a sufficient quantity to produce a maximum number of eggs, but a proper assortment must be furnished as well; in other words, the hens must be provided with a ration balanced for egg production. What is such a balanced ration?

In order to determine more fully the effect of certain rations and to demonstrate just what kind must be used to provide a balanced egg ration, a number of pens of hens are being fed on various foods at the experimental farm of the Missouri State Poultry Department. Each pen contains twenty hens.

C. T. Patterson, the pathologist in charge of the experiment, says: "The test with a wide ration, containing elements (starch, fibre, fat, sugar, etc.) which would produce three yolks for each white (which is formed from protein—lean meat, gluten, bran, etc.) laid 379 eggs the first six months."

"The test with a narrow ration, containing elements which would produce two whites to each yolk, produced 269 eggs.

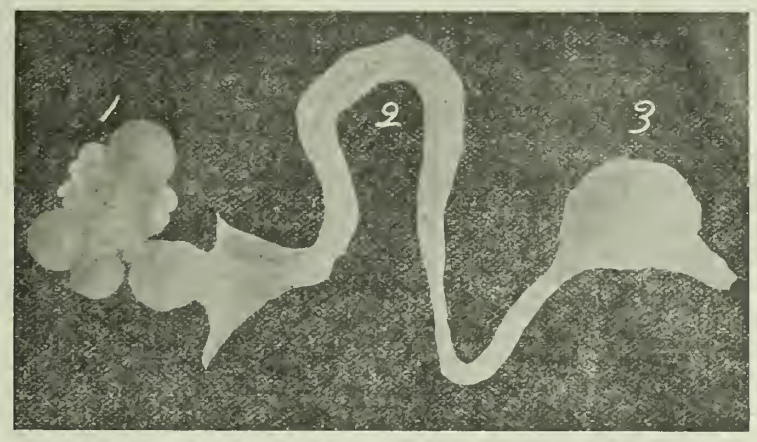
"The test with a ration containing equal yolk and white material, but without the minerals to produce the shell, produced 161 eggs.

"The test where the ration contained elements necessary to produce equally all parts of the egg (the above ration with the addition of ground shell) produced 1603 eggs in the same time. This ration is called a balanced ration for egg production."

A careful reading of the above will explain why some poultry keepers fail to make even the very best laying strains of hens profitable, and often for the occasional condemnation of the Hogan method of selecting the hens that have the capacity to lay large numbers of eggs. It also makes clear why descendants of heavy-laying, trap-nested hens in some poultrymen's hands fail to maintain the reputation of their strains.

Mr. Patterson goes on to say: "In order to explain more clearly what is meant by a balanced egg ration the accompanying illustration is given."

"The yolk is principally carbohydrates; the white, protein; and the shell, minerals. Thus the three parts of the egg are made from three kinds of food."



Mr. Patterson then gives some data and formulae based on Missouri conditions and products that are available and low priced there, which we omit; but in commenting on the results of feeding these rations he makes several very instructive statements, as follows: "The basis for computing the number of yolks and whites produced by each kind of feed was that one pound of carbohydrates would produce 3⅛ yolks; one pound of protein would produce 16⅔ whites, this being the rate of the average hen here at this station."

In these estimates only that portion of these materials that are digestible are considered.

This is a fair standard with which to compute a balanced egg ration anywhere; however, strange as it may seem to those who are inexperienced, in the warmer parts of California, where there is a very marked drop in temperature at night, a moderate increase in carbohydrates or heating food should be added, while along the Coast where it is cool but with little variation in temperature during the 24 hours a proportionally less amount of carbohydrates should be used. This increase of heating food in the warmer sections is of peculiar importance in feeding Leghorns and other small egg type fowls.

As it is stated that to produce a yolk, five times as much material is required as is needed to produce a white it may be well to explain that the greater part of the carbohydrates are used to produce heat and energy and only a small part goes to form the yolk, while a small part of the protein is used to repair waste tissue, etc., of the body, leaving nearly all of the material available for egg building.

As a further illustration, Mr. Patterson adds: "It will be seen that from 150 pounds of corn, 382 yolks and 198 whites are produced; therefore, it is not a balanced ration. The extra yolks (or the material that should go to make yolks) are built into fat. In this way, hens fed on corn alone get extra fat, and we hear the old expression that the "hen is too fat to lay." The expression should be changed to read, "the hen can't lay is the reason she gets too fat."

Egg Organs of a Hen, Straightened Out to Show the Sections Where Different Parts of the Egg Are Made: (1) Ovary, Where the Yolk Is Produced. (2) Part of Oviduct Where the White is Made. (3) Part of Oviduct, Where the Shell Is Made.

"Do cigarettes annoy you, Miss Kean?"

"Not at all. It's the fellows who smoke them that I can't stand for."
—Toledo Blade.

California Poultry Practice

WRITTEN TO TEACH BETTER POULTRY METHODS ON THE FARM. By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"'It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a milion copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

A FELLOW-FEELING.

I never liked young Tommy Brown,
For Tommy Brown, you see,
Is just the kind my people think
As good as good can be.

They say to me, "Now, Tommy Brown
Would never muss his hair,
Nor stamp his feet when things go wrong,
Nor strew things everywhere."

How tired I grew of Tommy Brown,
He seemed so very good!
The things he should not—never did,
But did the things he should.

Then once I went to Tommy's house
And heard his mother say:
"Now, Tommy, stop! Why, Teddy White
Would never act that way!

"You'd never see him leave his shoes
Around the floor like that,
Nor cry when asked to pick them up,
Nor tease the poor old cat."

So when I now meet Tommy Brown
I try to be polite;
I like him better than I did,
For I am Teddy White.

Harper's Monthly.

THE KISS THAT SUE REFUSED TO GIVE.

Mother tied the broad hat ribbons under the round chin and kissed the rosy little face beneath the flowered bonnet. "Be mother's sweet baby," she said.

She smiled back into the loving eyes and promised that she would be "good as gold" all day long. Then she trotted down the street, and mother's eyes followed the plump little figure till it turned a corner and was lost to view.

Another figure hurried around the corner as she did—Betty Gordon, who lived next door. But Betty did not stop. She only said, "Morning, kiddie," and passed Sue, walking very quickly.

Betty was a big girl of fourteen years, in the eighth grade, and Sue was a little girl of not quite seven years in the first grade; so Betty did not often stop to talk or walk with her, and when she did Sue always thought that it was a great favor. She thought Betty was sweet and pretty. This morning her big eyes noticed, even in the hasty glance she caught as Betty passed her, that her neighbor looked pale and worried. Sue knew why, for the day before Betty's mother had come to see Sue's mother, and Sue had heard her say that the mid-year examinations were being held and that Betty was studying hard for the mathematics examination, which was to come to-day, for she was afraid that she would not pass. It meant that Betty could not go on with her class. She looked at the girl hurrying on in front and hoped with all her little heart that Betty would pass.

It happened that the teacher who had charge of the first grade was a particular friend of the teacher who presided over the floor which the seventh and eighth grades occupied. Sometimes the two teachers sent little notes to each other by their pupils. This morning, while Sue was happily sponging her slate and getting her desk in perfect order—a task she always enjoyed—Miss Saunders called her to her desk and gave her a little folded note to take to Miss Brooks, on the third floor. Sue, very proud of being chosen for the mission, climbed the long steps as swiftly as her short legs would let her. She had never been on the third floor before. Outside the door she remembered that examinations were going on inside, and she paused and entered on tiptoe. She had to come in at the back of the room, and she made so little noise that no one heard her for a moment. Miss Brooks had left her desk and was at the other side of the room, and Sue stood for a second, looking for her. Then suddenly she saw something that she did not in the least mean to see. Betty was at the desk on the aisle, just in front of Sue. Her head was bent low as she worked, and as Sue looked she turned quickly, so that her neighbor across the way could not see her, and drew hastily from her blousy waist a thin little book, which she consulted for a moment, then quickly slipped it back, and while Sue was wondering why she seemed so anxious to have no one see her she looked up and caught Sue's eyes, and a deep flush spread from her forehead to her chin. And then Sue understood. She had not gone to school very long, but she knew that when you are taking examinations you must not look at the book or let any one help you; if you do, you are cheating. Miss Saunders had given them a little written spelling lesson one day, and one little girl had drawn her book from her desk and looked at a word. Miss Saunders had put her arm around the little girl and explained to them all why they must not do that and how cheating is just as bad as stealing. And there was Betty, who had been afraid that she would not pass, cheating! While Sue stood there with big eyes fixed in horrified surprise on Betty's flushed face, the teacher, moving nearer, caught sight of the little figure. She was almost at Sue's side before Sue saw her, and, startled, Sue could only gulp and hand her the note. Then her eyes went back to Betty.

Miss Brooks read the note. "No answer," she whispered to Sue. Then, noting Sue's looks, she added amusedly, "What did you see to frighten you?"

Over her shoulder Betty sent Sue a fierce, commanding look. "Keep quiet," it said.

She stood trembling, bewildered. Then she choked out, "N-nothing, ma'am," and fled. Once out in the hall, she sat down on the top step and sobbed miserably. She had told a lie. To keep from getting Betty into trouble, she had said she hadn't seen anything, when she had. She longed to get home to her mother, but she felt that this was a trouble she could not even tell her, for fear of "telling on" Betty; so she tried to wipe the tears from her chubby cheeks and went on downstairs, a mournful little figure.

Betty got through with her examinations early and overtook Sue on her woebegone way home an hour later. This time she stopped. "Thanks for not telling on me, kiddie," she said, smiling a bit uncomfortably. "You're a good little sport, and I'll do something for you some day."

She bent over the round little face, to kiss it, but Sue drew back. "I don't kiss cheats," she said, and she walked off very straight and proud.

"Well, you funny little trick!" began Betty, laughing. But as she stood looking after her, somehow the laugh died. A little mite of a six-year-old—and she wouldn't kiss her because she was a cheat! Suddenly Betty burst into tears. Then she turned and walked back to school.

"Sue," said Betty, the next morning, as Sue came out of her gate, "I went back to school yesterday and told the teacher I had cheated. I am to be punished somehow. I don't know how yet, but I don't care. I'm glad I did it. Would you"—she asked humbly—"would you mind if I kissed you now??"

Sue lifted a glowing face. Now she, too, could go to Miss Saunders and beg forgiveness for the lie she had told. But best of all, Betty was sorry. She had told, and she was not really a cheat. So they walked happily to school together.—Helen Dean Chappell, in The Pacific.

Bert: "I don't see see any use in this geography lesson." Mattie: "Why, you goosey, it's of the greatest use. It tells you where to go when you can't get there, and describes the country and all that. If we had no geography, we'd get lost all over the world."—Exchange.

When little Willie L. first heard the braying of a mule in the South, he was greatly frightened; but, after thinking a minute, he smiled at his fear, saying, "Mother, just hear that poor horse wiv the whooping cough!"

CARE OF ROSES IN AUGUST.

The care of your Rose Garden and its treatment, is easily a matter for first consideration. It is their summer dormant period. Although not generally understood or appreciated by amateur growers, it remains a fact that some of our finest and most perfect roses may be produced during the Autumn months, flowers which will even exceed in beauty and perfection those of the Spring crop.

There is usually a total absence of mildew in Autumn. This factor, in conjunction with the cool nights and warm days will give you magnificent blooms.

The time to begin a course of treatment which will be productive of the highest attainment of perfection both in growth and bloom during Autumn, is now. The treatment is simplicity itself and consists in merely withholding all water during July and August, this treatment applying, however, only to plants which were set during the previous year or years.

Roses which were planted during the past Spring have hardly at this period a sufficient root action established to withstand this treatment, but even with them water once every three weeks is ample. The same treatment holds good for Roses planted at the present time which are delivered as balled plants. In the case of these latter, water once every two weeks will answer.

With the matter of watering in hand we would emphasize, as we have many times before, the necessity of doing it thoroughly when it is done; by watering every two or three weeks, as previously referred to in the case of newly planted stock, we do not mean a sprinkling over the surface of the ground, but a thorough irrigation by bowls 18 inches in diameter by four or five inches deep, or by the trench system of ditches along the rows.

If you anticipate the planting of a Rose garden there is no time of the year better adapted for the purpose. It is out of the question to plant dormant, bare root stock now, but balled Roses or those established in pots or boxes if planted at this season become firmly rooted and grow away with great vigor with the advent of cool Autumn nights and ays. Not only that, but if good plants are used you can depend on a glorious show of blooms during October and November.

Regarding the varieties of Roses to plant, think twice before you act at once. Bear in mind that varieties popular ten or fifteen years ago have been so superseded by more recent kinds, both in vigor, perfection of color, form, etc., as to be hardly worth planting. Aim to plant the best and get the most possible satisfaction from that portion of your garden which is devoted to them. A poor variety requires the same amount of space, water, fertilizer and labor as a good one. Why not plant good ones? The initial cost is a little more but is manifold times offset in the ultimate satisfaction gained. Better one plant of Juliet than a hundred Mad. Lambard or Duchess de Brabrant.—Fred H. Howard, Los Angeles.

SWAT THE FLY

"O every fly that skips our swatters,
Will have five million sons and daughters,
And countless first and second cousins;
Of aunts and uncles, scores and dozens,
And fifty-seven billion nieces;
So knock the blamed thing all to pieces."

—Walt Mason.

Little Janet and I were digging in the back yard, preparatory to planting flower-seeds. She was some distance from me, busy with her tiny spade, when all at once she cried: "O Mother, come and see! I've found the funniest bug! It hasn't got anything 'cept a long, fat tail." It was her first angle-worm.—Little Folks.

California Garden-Flowers

SHRUBS, TREES AND VINES

Being Mainly Suggestions for Working Amateurs.

By Edward J. Wickson,
Hon. President, California State Floral Society.

FIRST EDITION—1915.
262 pages, 5½x7½ inches; illustrated; cloth bound; 12 full-page photo-plates and numerous text illustrations.

This book aims to tell the beginner in California, whether he be a scholar struggling with his school-garden, or a suburban gazing vacantly on his residence lot, or the farm-home maker, who is puzzled to translate his experience with teams, plows and pasture fields into trowels, pruning-shears and lawns, just what to do to make garden-soils, grow plants and surround his abode with beauty under the peculiar climatic conditions of California.

READY BUILT HOUSES

You Saved Me Considerable Money.

John Rogers of Moore, Ida., writes us. Mr. Rogers bought one of our 'knock down' houses and built it himself. He is not a carpenter, but the construction of the home was easy—easy because all he had to do was fit the numbered pieces of material together, and "follow the plans." Hundreds of dollars are saved in initial cost of material and labor. You can get your home for as low as $205—guaranteed to be satisfactory. Today send for your catalogue.

READY BUILT HOUSE COMPANY.

Gas Stove Convenience with Kerosene

Hot in *Your* Kitchen?

No need of it if you cook with a good oil stove. The heat is concentrated on the cooking—not radiated throughout the room.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Abundant heat—always ready at the touch of a match—like gas. Can be turned out the minute you finish cooking. Cooks anything your wood or coal range does—and there's no heavy hods to lug—no dirt or ashes. No odor. Does not taint the food. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

STANDARD OIL COMPANY
(California)
San Francisco

The Markets.

Unless otherwise quoted f. o. b., San Francisco.

San Francisco, August 18, 1915.

WHEAT.

Both California and Northern clubs are decidedly firmer this week and a slight advance in both is expected any day. The bulk of the receipts of new crop continue to show up rather poorly as regards quality.

Sonora	$1.77½ @ 1.82½
Cal. Club, ctl	1.80 @ 1.82½
Forty-fold	1.80 @ 1.85
Northern Bluestem	1.95 @ 2.00
Northern Club	1.80 @ 1.82½
Northern Red	1.75 @ 1.90

BARLEY.

There is still another advance this week in barley, both shipping and feed being up since last reports. The market for futures is also very strong with prospects of further advances.

Shipping	$1.32½ @ 1.35
Choice Feed, ctl	1.27½ @ 1.32½

OATS.

Like other grains, oats are very firm with a tendency toward higher prices. White oats have been marked up five cents. So far, there has been no change in red feed, though strictly fancy lots might bring a little better than the figure quoted. Most of the feed on the market is of inferior quality and this is selling at less than the quotation.

Red Feed	$1.35 @ 1.45
White	1.50 @ 1.55

CORN.

Eastern corn appears to be a little less firm this week, though as usual the local market is but little affected by minor eastern changes. Little interest has been shown here lately; and transactions are not very large.

California Yellow	$1.80 @ 1.85
Eastern Yellow	1.85 @ 1.90
Milo Maize	1.75 @ 1.80
Manchurian	1.40 @ 1.60
Kaffir	1.80 @ 1.85

BEANS.

Notwithstanding a good deal of talk of large bean crops, the market continues firm, and the only changes made are of the upward sort. It is said that a large aggregate of beans will come in this year from new sections where beans have not heretofore been grown. These are generally in small lots, largely of black-eyes and small whites, put in in anticipation of a war demand. Whether or not these will have a tendency to lower the market will depend on whether or not the expected war demand materializes. Advices from the country indicate good crops in the chief growing districts.

Bayos, per ctl.	$3.75 @ 3.85
Blackeyes	4.00 @ 4.25
Cranberry Beans	3.50 @ 3.75
Horse Beans	1.75 @ 2.00
Small Whites	3.75 @ 3.90
Large Whites	3.50 @ 3.75
Pink	3.00 @ 3.20
Limas	4.15 @ 4.25
Red Kidney	4.90 @ 5.00
Mexican Reds	4.90 @ 5.00

HAY.

The hay market here continues in very good shape, with a somewhat firmer feeling now than a week ago, though quotations show but little change. Less than four thousand tons arrived in San Francisco this week; and the bulk of this was of the better grades. Arrivals of alfalfa hay in this market continue very limited; and an advance in prices for this item would not be surprising. A good deal of movement in alfalfa is reported at interior points. The export movement from San Francisco to Australia continues, one cargo leaving this week and another vessel having been chartered. The harvest continues under favorable conditions as to quality. Large quantities are being stored in the country for winter use and sale; and this is adding to the firmness in the spot market here.

(On track, San Francisco.)

No. 1 Wheat, per ton	$11.50 @ 12.50
do No. 2	8.50 @ 10.00
Barley	8.00 @ 10.00
Tame Oats	9.00 @ 12.50
Wild Oats	7.00 @ 9.00
Alfalfa	8.00 @ 11.00
Stock Hay	5.00 @ 5.50
Straw, per bale	.25 @ .40

SEEDS.

(Wholesale prices, San Francisco)

Alfalfa	Nominal
Brown Mustard, per lb.	Nominal
Canary	10 @ 12½c
Hemp	3 @ 3½c
Millet	2½ @ 3 c
Timothy	7½ @ 8 c

FEEDSTUFFS.

All feedstuffs continue very firm at the present high figures. There have been no actual advances this week; but it is predicted that the next changes will be upward.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$20.00 @ 21.00
Alfalfa Meal, ton	14.00 @ 15.00
Alfalfa Molasses Meal per ton	18.00 @ 19.00
Bran, per ton	28.00 @ 29.50
Oilcake Meal	38.00 @ 39.00
Cocoanut Cake or Meal	23.00 @ 25.00
Cracked Corn	41.00 @ 42.00
Middlings	35.00 @ 37.00
Rolled Barley	27.00 @ 28.00
Rolled Oats	33.00 @ 34.00

VEGETABLES.

Considerable drops were scored this week in a number of lines. String beans have generally held their own; but peas have dropped about 50c. a sack all along the line. Tomatoes, though of good quality, have been lower most of the week, with an upward move at the last. The general run of cucumbers is down to less than half the prices of a few days ago. Summer squash has also suffered a severe drop. Green corn and okra, are the exceptions to the rule, each being quoted above last week's figures.

(Wholesale prices, San Francisco.)

String Beans	1 @ 2½c
Lima Beans	3 @ 4 c
Peas, sack	.75 @ 1.50
Peppers, bell, bx.	25 @ 30 c
Tomatoes, lug,	50 @ 75 c
Cucumbers, lug	15 @ 35 c
Eggplant, lug	20 @ 35 c
Summer Squash, lug	15 @ 25 c
Green Corn, sack	.75 @ 1.30
Okra, lug	60 @ 75 c

POTATOES AND ONIONS.

The feature of the market is the heavier receipts of sweets, which are now selling at from 2 to 3½ cents. Onions are weaker and are getting but little attention. Garlic is firm at a cent advance with a prospect of going higher.

Delta Burbanks	.75 @ 1.00
Sweet potatoes, lb	2 @ 3½c
Onions, ctl.	.40 @ .60
Garlic, per lb., new	5 @ 7 c

POULTRY.

The poultry market is in good shape, the large arrivals of the week being pretty well cared for without any depression in prices. Eastern stock has been coming in pretty freely, while the arrivals from the country have been fully up to the average.

(Wholesale prices, San Francisco.)

Live Turkeys, lb	15 @ 28 c
Broilers, under 5 lbs.	27 @ 28 c
Fryers	22 @ 24 c
Hens, extra, per lb	16 @ 17 c
Small Hens, per lb	13 @ 15 c
Smooth Young Roosters per lb	23 @ 25 c
Squabs, per doz	$2.00 @ 3.50
Geese, per pair	2.00 @ 2.50
Ducks, young, lb	13 @ 14 c
Old	12 @ 13 c
Belgian Hares	7 @ 8 c

BUTTER.

The consuming demand has been large; but prices have been held down by the very heavy arrivals, especially from Humboldt County and from Oregon. There has been no change in prices throughout the week, except the half cent advance at the end.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	27	27	27	27	27	27½
Prime Firsts	25½	25	25	25	25	26

DECIDUOUS FRUITS.

The market has continued active this week; but the heavy demand has not been sufficient to offset the ripening crops and the heavy arrivals. Almost without exception, prices are lower than a week ago, and in some cases the recession has been very marked. Grapes are in large supply and lower, muscats being now added to the varieties offered. Raspberries are no longer quoted, while strawberries and blackberries are both off fifty cents. Peaches are in larger supply but of excellent quality and are holding their own in prices. Cantaloupes are in large supply; and, as the quality is uncertain, prices are low and vary with the quality. Apples are moving slowly at lower prices. Some very fancy Bartlett pears have been sold at $1.75.

Huckleberries, lb	7 @ 11 c
Strawberries, chest	1.50 @ 3.00
Blackberries, chest	1.00 @ 2.00
Plums, crate	40 @ 75 c
Prunes	.75 @ 1.00
Figs, bx., double layer	.75 @ 1.00
Nectarines, crate	.50 @ .75
Pears, Bartlett, bx	.60 @ 1.75
Peaches, small box	20 @ 40 c
Crates	65 @ 85 c
Apples, Grav., 4-tier	.75 @ 1.00

Cantaloupes, crate	.40 @ .85
Watermelons, doz.	1.00 @ 3.50
Grapes, crate, Thompson Seedless	.60 @ .75
Malaga	.50 @ .65
Fontainbleau	.30 @ .50
Tokay, box	.40 @ .60
Muscats, box	.60 @ .75

DRIED FRUITS.

Some lots of new dried apples are offering; and some sales have been effected at 6 cents. Some transactions have also been closed in the country at about the same figure for fancy grades. Apricots are steady, most of the sales being made around 7 cents, though local buyers admit that strictly fancy Mooreparks might bring a little above 8 cents. As yet there are hardly enough new crop figs in to figure on. The outlook is said to be for a short crop of everything except Calimyrnas. No new pears have yet reached San Francisco. There has been no further change in the prune situation; and other lines remain about as heretofore. The New York Journal of Commerce says of the eastern situation:

"The impression prevailing in the New York market is that there will probably be only very limited prune shipments made during September and in some well informed quarters it is said that it is doubtful if any stocks will be shipped during September. Advices are to the effect that unseasonable weather has interfered with the development of the growing crop and that the yield is expected to be about two weeks late this season. Reports received from the coast within the past two or three days, however, state that weather conditions are showing marked improvement and that the principal prune districts are experiencing hot, dry days which are rapidly maturing the fruit.

"In spite of the expected shortage of available crop for late September shipments quotations are made in the spot market here offering stocks at a 4c basis for 40s to 60s inclusive. Trading is only being done on a very light basis.

"There is more interest shown in October orders than in either the earlier September shipments or the November delivery. Offerings were made for first half of October delivery at a 3¾c basis for equal quantities of 40s to 60s, inclusive, in several quarters, and there were some operators apparently willing to shade this figure to a 3⅝ basis for October delivery.

"Conditions in the spot prune market remain very quiet and are normal for this late season of the year. Supplies on the market are very light but are being replenished almost daily by additional shipments from interior points, which are anxious to clean up on their stocks before the arrival of the new 1915 pack. There continues to be a tendency to shade the quotations, which are generally given out, though operators who are ready to do this are believed only to control small stocks. All trading is being done only for exceptionally limited quantities. The European demand for old crop prunes has been lacking again this week though inquiry is said to be received with frequency. The foreign buying during the past month has been very spasmodic and last week was very heavy, followed by extremely light sales this week."

CITRUS FRUITS

The valencia orange market in the east continues to be strong and active, while the lemon situation continues to drag, prices are a trifle higher, but the demand, owing to cool weather, is very light. At New York, Monday, Aug. 16th, the auction market averaged from $3.20 to $5.60 for valencias and from $1.85 to $3.05 per box for lemons. The same day Chicago prices averaged $4.50 to $5 for valencias and $2.75 to $3.25 for lemons.

Shipments of oranges are going east at the rate of about 50 cars daily. Lemon shipments are about half that number. It is estimated that California has yet about 2,000 cars of valencias to send out before the end of the season.

Fancy Valencia oranges are reported firmer here and in the south. No great interest in oranges is manifested here owing to the abundance of other fruits. Other lines show no change.

(Wholesale Prices, San Francisco.)

Oranges, Valencias, bx.	$2.75 @ 4.00
Grapefruit, seedless, bx.	2.50 @ 3.00
Fancy	3.00 @ 3.50
Lemons, box	1.50 @ 3.50

NUTS.

With no advices from Europe as to what may be expected in the way of nut importations, the situation is very uncertain. The Exchange has not yet named prices on new crop almonds; and pending this, little or nothing is expected in the way of outside buying. Some offers have been made by packers, but so far as can be learned these offers all have strings to them and are dependent on Exchange prices yet to be made.

SPECIAL DECIDUOUS FRUIT MARKETS.

By J. F. Nagle.

Sacramento, Aug. 17, 1915.

All markets have remained firm during the past week, due to the fact that receipts from Eastern states have been somewhat lighter, the Ozark districts alone contributing a heavy supply. Peach shipments from the Southern states will be finished within a week and though we may feel the effect of Middle West shipments within the next few days and later on receipts from the Northwest, New York State, Michigan, Utah and Colorado, these will be distributed over a period of sixty to ninety days and will be generally scattered throughout the country. Consequently competition will not be as serious as that which we have experienced so far this season and we look for a better tone to the market from now on.

California mountain Bartletts are moving in car lots and the quality is exceptionally fine. The fruit is free from blemishes of any kind and what few boxes have already arrived in the East have sold at very satisfactory prices. The tonnage will amount to not more than a few hundred cars as the crop is not in excess of 75 per cent.

Shipments of Malaga grapes from Fresno are still light, due to the fact that the berries are not taking on very much sugar. It is doubtful whether straight cars of Tokays will be shipped East much before the first of the month. Owing to the cool nights the berries are taking on color, but the sugar content is considerably below that required by law. There is no improvement in the crop situation; as far as Tokays are concerned, we do not estimate the crop to be in excess of 60 per cent.

The canners are showing a little inclination towards buying Salways, but at a figure that is not attractive, ranging from $7.50 to $10.00 a ton. There is practically no interest so far in Clings and it is not unlikely that several cars will be shipped East in the regulation boxes.

The following prices have ruled for the week:

New York—Bartlett Pears averaged $1.80; B. Hardy, $1.40; Malaga Grapes, $1.19; Thompson Seedless, 94c; Elberta Peaches, 72c; Tuscan 75c; Crawford Cling, 80c; Kelsey Plums 87c; Diamond, 95c; Gross, 93c; Duke, $1.10; Wickson, $1.00; Giant, 85c; Nectarine, 95c.

Chicago—Elberta Peaches, 45c; Crawford 52c; Burbank Plums, 90c; Diamond, $1.00; Giant, $1.08; Wickson, $1.06; Grand Duke, $1.00; Gross, 87c; Nectarines $1.09; Thompson Seedless Grapes, 87c; Malaga, $1.04; Bartlett Pears, $1.42.

Boston—Malaga Grapes, $1.00; Thompson Seedless, 92c; Bartlett Pears, $2.10; B. Hardy $1.85; Diamond Plums, $1.28; Giant, $1.15; Duke, $1.37; Sugar, $1.00; Kelsey $1.23; Wickson, $1.03; Gross, $1.42; Crawford Peaches, 55c; Tuscan 70c; Elberta, 67c.

Total shipments to date, 6163 cars; total shipments same date 1914, 7152 cars.

REPORT OF GROWERS' COMMITTEE.

We are informed from many districts that as the growers begin to harvest the prune crop it shows to be lighter than has been estimated and that the total amount harvested will fall considerably short of previous estimates.

Growers generally appear determined to hold the 5c basis which they declared for at the Growers' Mass Meeting which appointed this committee.

Buyers are now out offering materially higher figures than at the time of our last report, and market conditions appear to be more favorable generally to the grower. We call the attention of growers to the apricot situation. Before apricots were ready to pick we were assured they could not possibly bring more than 6c or 6½c, but no sooner were they ready for market than the price rose to 8c with brisk demand. This certainly should have some meaning to the Prune Grower.

J. H. BONE, Chairman.
H. O. H. SHELLEY, Sec'y

CALIFORNIA ALMOND GROWERS' EXCHANGE

311 California Street, San Francisco, Cal.

Publisher's Dep't.

Several announcements of dairy cattle sales appear in this issue. California should have more purebred auction sales. Not only would buyers be benefited, but breeders of small numbers of stock could consign to them and find ready market for any surplus.

At the recent nurserymen's convention held at San Francisco, considerable attention was given to ornamentals. We believe every advertiser of commercial trees should embody in his announcements that he has ornamentals, roses, etc., for sale.

Our book department is sending out a steady stream of books that we publish. The leader of course is is California Fruits, next is California Vegetables, then follow California Flowers, California Poultry Practice and One Thousand Questions in California Agriculture Answered. The latest book we have placed in stock, "Productive Feeding of Farm Animals," by Prof. F. W. Woll, is selling well. Our new "California Hog Book" is progressing nicely and we expect to have it ready for distribution by the middle of next month. It will be handsomely illustrated, and sell for $1.00.

On December 15th the Killefer Manufacturing Company received an order from the New York office of the Holt Manufacturing Company of Stockton to deliver one of their deep tillage plows, to be used with a Caterpillar tractor, such as are used extensively by the beet and bean raisers of California, to the J. B. Duke Estate of Somerville, N. J. This plow and Caterpillar tractor was delivered to the Duke Estate with an absolute guarantee to do the work satisfactorily to them.

As proof that the outfit did give entire satisfaction, a duplicate order was received July 1st for another Caterpillar tractor and plow to be delivered August 1st, and before it would possibly have been received by the Duke people, a third telegram was received ordering three outfits similiar to the first, to be shipped to the J. B. Duke Estate of Great Falls, S. C. This telegram was dated New York, August 4th and proves without a doubt the satisfaction given by the first Caterpillar and plow used the last six months on their Somerville estate. The facts as given above are not only a great endorsement for California Caterpillar tractors and plows, but also for California deep tillage methods that are being proven year by year in our State by actual cash results as taken from the books of our business-like, progressive ranchers.

Mr. C. E. Bateholts, Chief Photographer of the General Electric Company, Schenectady, New York, has just returned to the East after spending three weeks in California taking extensive motion pictures showing how the California farmers are using electricity to do their work. By means of a very unique story woven into the film a farmer of the old school is shown how electricity is made and what it can do for the farmer. He is shown each step in the making of the "white coal" from the melting snow down through the power houses and transmission lines to the lights in his parlor. He is taken out on the farm electrical where the pump, thresher, wood saw, ensilage cutter, milking machine, cream separator, churn, washing machine and many other devices are operated by electric motors. He sees great possibilities in the use of electricity in all of its forms and determines to hereafter let electricity do his work. These films will be shown throughout the United States and two copies will be printed in Spanish and Portuguese to be shown in South America.

RAISE SEED FIELD CORN.

[Written for Pacific Rural Press.]

Field corn production for grain and silage is increasing in California by leaps and bounds. All the experience in the older corn states shows the necessity of selecting seed corn before harvest, or the yield will "run out." The best section of the field, large enough to produce all you want for yourself and for sale, at a point considerably removed from fields of other varieties, may be selected.

Poison Worms and Beetles.—Since perfect ears are most salable, it will pay on seed corn to dust powdered acid arsenate of lead on the silks to kill the "green ladybirds" (diabroticas) and the corn ear worms. The former prevent pollination of many kernels by eating the silks, while the latter disfigure the ears.

One Thousand Questions in California Agriculture Answered

Consists of 1000 of the most important questions on every subject that have perplexed the farmer and which have been submitted to the editor. The problem appears with its solution by Prof Wickson immediately following; a comprehensive index enabling the reader to find the subject which interests him without delay. The 1000 questions and answers cover Fruit Growing, Vegetable Growing, Grain and Forage Crops, Soils, Fertilizing, Irrigation, Live Stock and Dairy, Diseases of Animals, Feeding Farm Animals, Poultry-keeping and Pests and Diseases of Plants, etc., etc.

This is a book of reference that every farmer, no matter in what branch of farming he is engaged, should have on his shelf. First Edition.

Price, $1.50 postpaid.

International Harvester Wagons—Weber—Columbus

THERE are a few points about the new **Columbus** and **Weber** wagons that every farmer ought to know. These points make the difference between **Columbus** and **Weber** wagons and others—a difference that means a good deal to you.

The fifth wheel, that prevents the pulling up and pitching of the bolster, makes it easier for your team to pull a **Columbus** or **Weber** wagon and does away with bent and broken king pins and circle irons. The patent folding endgate and the link end rods save much of your time in the busy season. The high-grade wood, iron, steel and paint used add years to the life of **Columbus** and **Weber** wagons. These things mean economy.

These points are explained in detail in our wagon folders and are pictured so plainly that it's almost like looking at the wagon itself. Some dealer near you handles these wagons and has samples set up for you to see. Drop us a line and we'll send you the booklets and folders. We'll also tell you where you can see a **Columbus** or **Weber** wagon so you won't have to waste any time looking for it. Write to us today.

California Barley: Six to Two.

This may look like a base-ball score, but it is the result of half a century's experience in California that six-rowed barley is better than two-rowed; and that upsets the world.

[Written for Pacific Rural Press.]

SO FAR as this writer knows, no one has ever demonstrated the origin of the six-rowed barley which has been largely grown in this state since pioneer times. If any one can tell us whence it came to California and when, we would highly appreciate the facts. It has been known as "common barley" in this state for more than forty years to the writer's knowledge. Previous to that time also a more recently introduced variety, called "Chevalier," had become rather widely known, for in 1875 there were three market grades of barley, viz.' "feed," "bay brewing" and "Chevalier"—this being a two-rowed barley: the only two-rowed kind which ever attained very wide fame in this state, though others were more recently introduced and grown to some extent. At that time there was also distinction made between "coast" and "bay" barleys—the latter always selling higher because plumper and brighter. The term "bay barley" applied chiefly to the product of Alameda, Santa Clara and San Mateo counties—all of them bordering on the bay of San Francisco. The term "bay-brewing" then signified the best of the crop grown in the bay region. It was, therefore, simply the best of the six-rowed common barley — the name being geographical, not varietal. In this bay district also was grown practically all there was of the Chevalier at that time, but it was never called "bay brewing" because it had its own varietal name and it was worth keeping because in 1875 "Chevalier" was quoted 30c per ctl. higher than "bay brewing." This wide margin of value soon narrowed to an average difference of 5c per cental and from that time to the present, as will be shown later, the importance and price of two-rowed Chevalier as related to six-rowed "bay brewing" has declined. Later still when barley for export became more profitable and it was found that the interior valley product could meet the demand, the term "bay brewing" has now become little more than a memory, and the best of the six-rowed common barley grown in many places became the real contestant with two-rowed Chevalier, also grown beyond the limits of the bay district. More recently still, the word "brewing" has well nigh disappeared and barley is now classed as "shipping" and "feed"—the latter often being taken out of the former by grading machinery.

UP-TO-DATE BARLEY HARVESTING IN CALIFORNIA.

Front and side views of Combined Harvester operated by traction engine. These harvesters of immense capacity have greatly reduced the cost of putting barley in the sack and are well adapted to the broad plains of the great valleys where barley is now chiefly grown.

At different times, during the last two decades of the last century, the brewers engaged several European experts to examine their materials and processes. These experts, having grown up with the idea that two-rowed barleys could alone reach the characters desirable for malting, naturally reported that California could not expect to make good beer with six-rowed barley. The brewers therefore undertook something of a propaganda to push the California growers to a two-rowed product. This accomplished nothing because the California farmer strongly preferred a grain which had six rows of kernels to the head than one which grew only two rows, and he kept on growing the former. We strongly suspect that the superior growing conditions in California enable the plant to fill six rows with plump kernels quite as easily as the European conditions fill the two rows.

About ten years ago or more Dr. Robert Wahl of Chicago, a leading American brewing expert, began a systematic investigation of American brewing barleys and pursued it faithfully. He secured samples from different parts of the country including one from California marked "Bay Brewing" which he seemed to at first accept as the name of a variety, whereas it was only a trade name, with a geographical basis, as claimed above. Its quality and behavior gave it high standing in his researches and led him forward a step toward the conclusion that European two-rowed standards were neither necessary nor warranted in the United States — at least not in the region west of the Rocky Mountains, where practically all the brewing barley in this country is grown. His next conviction was that America should develop its own types of barley, and in work looking to this end, he co-operated with Mr. Carlton of the Cereal Division of the United States Department of Agriculture. And now Dr. Wahl is well established in the belief that a six-rowed barley may not only be best

San Luis Obispo	0	.01	.03	80	52
Los Angeles	0	0	0	86	58
San Diego	0	0	0	74	62

THE WEEK

August has been living up to its record as the month of least rain or of no rain at all at most California places—and yet in the bay district it has walked very close to the danger line, and visitors from a distance have had to learn that delicate distinction between a heavy fog and a "trace" of rain. Although parts of the interior have justified their characters as hot and dry, the coast has been normally cool and moist, and causes one almost to feel the early rains of September coming. But August threats do not by any means assure September doings and the latest wisdom of the meteorologists is no better than that of their ancestors in the "farmers' almanacs"—"about these days look out for rain." It is therefore surely the time when the farmers, and others who have valuable things exposed, should hurry them to cover. Much good produce is lost or injured every year by the unexpected arrival of the early rains, and it does not recoup the loss to have a month or two of perfectly delightful dry and warm weather afterwards. It should, however, favor the enforcement of "safety first" for that which is in shape to be injured—other things can be easily caught up during the multitude of good working days which autumn always brings.

Wishing good-bye to the thousands who are in California only for the sights of it, it is interesting to note that, aside from the fair-seekers, California is gaining population quite rapidly. California's population on July 25, 1915, according to C. E. Cooper, statistician for the State Controller, was 3,198,300, an increase of 920,751 over 1910, when the federal census gave the State a population of 2,377,549. It is generally believed that before the next federal census is taken California will have reached the 4,000,000 mark. Our personal notion is that it will be much greater than that—but some of us will see how that may be.

Fore-Headed is Fore-Handed.

Although there is much of the ingathering of 1915 still to do, it is high time to give what thought one can to the in-putting for 1916. California agriculture well done is a thrifty evergreen; one timely job to do claims attention before the job that is doing wholly relinquishes it—just as the new leaf of the evergreen does much of its growing while the old leaf is dying. The sap is always flowing, and by so much as the old tissue excludes it by its hardening, the new tissue welcomes it by its open osmotic opportunity. The California plant-grower should plan his work in the same way; he should have his next job started before the current job is finished—if he desires to get all the advantage in production which our always-active climate is ready to contribute to his success. "But," some lazy reader will exclaim, "you are a cruel slave-driver; you would make us work all the time. Are you not afraid of being mobbed by the reformers who demand an eight-hour farming day and then a six-hour day? Besides, how inconsistent you are: for, not long ago, you told us all to go to the Exposition when the harvest is over. Now you are fixing up a schedule which will keep us always grubbing."

That is exactly where many people fall out of their berths. Well-planned work does not mean always at work. It is the man who gets ahead with his work who is never driven by it. It is the man who will not think ahead who is always behind with his legs and arms. If you have everything all-set when Nature comes along with her motor-truck, can't you see that she will take up your burden at the start and not keep you chasing down the dusty road, trying to catch up and throw it over her tail-board? California is fine, of course, for the man who wishes to work all the time and makes beneficent provision, too, for a man who has a clear head and a strong leg, because he can get twice as much value from a year if he knows how. California is splendid also for the man who wishes to enjoy reasonable leisure, because growing conditions are always active for something and he does not have to wait for a few days of this or that, during which a crop can be well put in or safely taken off. But the man who has the fullest success, and most leisure also, is the one who is fore-handed with his work and gets full advantage of natural things as they come along.

September Morn.

Is the autumn the death of the year? Not at all: in California, it is the birth of it. How few people fully realize this fact! They err at the very beginning, very often. Take that matter of "going into farming" which so many city people cherish as a lofty business. The wage-earner, for instance; he plans to keep at his job through the winter and have so much more money to start with in the spring! Or the city merchant: he plans to sell out after the holiday trade and buy a farm in the spring! It may be all right from the point of view of stopping in the city, but it is all wrong for starting in the country. September is the California spring time, because it is the beginning of the longest growing season of the year, and because most herbaceous plants enjoy starting at that time, and filling the whole stretch of months from December to June with garden flowers and vegetables and most kinds of field crops also. As just suggested, they may not insist on that time of starting, because so many plants in California are willing to accept much latitude in sowing and planting time, but this thing is sure: if the plant does not start on September morn, the grower should start then with preparations for them. Practically everything does best with an autumn start, except, perhaps, a few evergreen trees, which prefer a start in warmer ground in May and a few tender herbaceous plants which insist upon total freedom from frost by starting at about that time. Besides, September is the best month to buy a farm, not alone because that is the time to get busy with it, but because that is the time when it looks worst and one has a chance to see how deep his farming sentiment is; also because he can then see how dry the soil gets, how much alkali blooms on it, how low the water falls in the well, how dry the "irrigation system" gets, and how much dust he has to reckon with on the highway, etc. The real estate agent, too, is then at the low point in his vocabulary and you have all the talking advantage. You can knock him all around the place with hardly a protest. We have no doubt at all that a man can often save more money by buying in September than he can gain by working another half-year and waiting for the sales' agent to lead him by the nose through the fields of wild flowers and the fruit trees garlanded with blossoms, and the ditches of the "irrigation system" running full of storm water! September morn is the time to study the nude in California farming!

We Wish to Push Seasonable Business.

But we had no idea of buying and selling land when we began this discussion of autumn activities. The real estate agents can get even with us by quoting the above paragraph in their circulars of "autumn offerings." It may help a trade which has not been gilded by Exposition splendor as fully as expected. They may need a lift in their immediate business—later trade will be all right without it, for surely California is getting a great uplift in the general way, and if the farmers of the world do not want to live in California, we shall have to put up with a population of poets, orators, artists and litterateurs—and that may make it all the more profitable for the farmers we now have and whose achievements have made California famous. What we intended to say was calculated to be suggestive to them any way. It was simply an exhortation to begin early and catch the year-long growing season in its full length and breadth. And as we are always happier when we are scolding somebody, we make our point that way.

Perhaps one of the chief reasons why California planters of gardens and fields are so often late in their operations is because our seedsmen, nurserymen and florists do not observe the proper season for the issuance of their attractive announcements. What is the effect of receiving a seed catalogue in October, or later, which advises planting seeds or bulbs in August or September, in frames or the open ground as the case may be, for early product and for the beginning of a long succession? Is not the recipient apt to say: "Oh, well, it is too late for this year!"

Why Don't the Seedsmen Do It?

Why do not the seedsmen take a hint from the fashion-printers? Every farmer knows in June, if he pays proper attention to such impor-

tant matters, whether he must buy tight or baggy trousers in autumn, and every farmer's wife knows whether she must buy ample crinoline or be swathed centrally with a few yards of cloth—as a green-grocer enwraps a bunch of celery. If then the clothing merchants give not only timely hints, but hints in time, how much more important it is for the seedsmen and plantsmen to do likewise. We do not know why they do not; possibly they think they have to wait to know what stock they can get, etc., and in these war years it may be harder than ever to know that. Still it seems to us that at least provisional announcements may be made—such as: "Holland bulbs, if the Kaiser pleases," etc., etc.

We are quite sure the nurseryman's conscience troubles him about late printing of catalogues, because we received a printed postal from a leading propagator the other day, suggesting that orders be sent without waiting for the catalogue. We have a notion that at least nine-tenths of what is usually catalogued can be surely promised and the other tenth provisionally, and then all planters could have catalogues in July or August, and the exhortations to early planting would be truly promotive. We feel a little sensitive about this because we have in the hands of California planters something like thirty thousands of our horticultural books, giving planting calendars and urging best times for doing things, and the trade makes the readers unable to seize the best times because it is two or three months late with its announcements.

Plenty of Bulls, but No Bulbs.

The late printing of catalogues cannot be much helped for this year, perhaps, but reform can be accomplished in the future, and, later on, we shall try to coax the publisher to hang up a page of free advertising as a premium to that seedsman whose catalogue appears first in the proper season of July or August. The present practice is a good deal of a joke, in a way, because Eastern seedsmen issue catalogues in January, perhaps, for next May planting, while California distributors print in November for planting to begin in the previous September! And naturally their newspaper advertising is also just as late and proportionally ineffective. Barring a few wise men, who keep their business in the planters' eyes all the time and profit by it, the great run of advertising for planters begins when the proper season is one-quarter over! Thus two or three months of good business is lost to the seed and plant distributors and the planter is discouraged from doing many things which would rejoice his heart and fill his pocket. We have often thought of this scolding, but never have found ourselves quite cross enough to do it right. Just see how it is in this month's issues, for instance—45 columns of advertising of perfectly good bulls and rams, pumps, automobiles, tractors, silos, implements and machines, etc., which thousands of readers should have, and only one column of plants and seeds, which every one at this season of the year should have in hand, or be ordering now, that he may begin the California growing season aright.

Government Gold on Cotton.

Cotton is believed to be in a bad way, through the action of the allies in placing it on the contraband list, and U. S. Secretary of the Treasury McAdoo has announced that he would, if it became necessary, deposit $30,000,000 or more in gold in the Federal Reserve banks at Atlanta, Dallas and Richmond for the purpose of enabling the reserve banks to rediscount loans on cotton secured by warehouse receipts; or, if the object could be accomplished with greater efficiency thereby, the deposits would be made directly with national banks agreeing to lend the money on cotton at a rate not to exceed 6 per cent. This government gold would be placed in the banks with no charge for interest, and presumably it is not to be loaned, but to stay in the vaults as a safeguard so that the banks can lend their own money more freely and cheaply without fear of being caught short in case of a run.

It is interesting to note the reason for doing this. As stated by Secretary McAdoo, it is for this purpose: "To help the cotton producer of the South in the circumstances; as it is a matter of economic importance to the entire Nation that those who have produced the cotton crop shall have a fair opportunity to dispose of it gradually and in orderly manner, so that they may not be forced to market their crop at sacrifice prices."

The question naturally arises whether it is of any greater economic importance to the nation to protect the producers of cotton than the producers of grains, meat products, cured fruits, or other imperishable, exportable food supplies, against "sacrifice prices"—but this need not be argued now. One thing is clear and that is, that cotton is available security, because grading, warehousing, etc., have been long provided for, so that cotton paper is recognized as negotiable. Grain is a certain distance along the same road in some parts of the country, but not so far as cotton. The obvious conclusion is that to make all food products a proper foundation for credit there must be close standardization and legally prescribed storage, certification, etc. The first thing to do to get food products recognized as security is to get them ready for such reeognition.

Queries and Replies.

Querists must give name and address.

Little Leaf of the Apple.

To the Editor: I am sending apple twigs which are badly affected by some disease. These samples are taken from thrifty young trees from 5 to 8 years old. The affection was first noticeable last year and the branches that were affected did not recover, but looked the same as these enclosed, which are this year's growth. I have examined the trees a number of times for insects, but have never found anything. The leaves of these branches remain in a dwarfed, misshapen condition all the season. I have made inquiries about this, but have not found anyone who understood it.—Subscriber, Stonyford.

This is an old trouble of the apple in many parts of the State. It was at one time called "sour sap in the top," and was supposed to be caused by frost after sap-flow began in the spring. It is probable this is neither the character nor the cause—in some cases at least. Several years ago Prof. R. E. Smith described it as "Little Leaf of the Apple," and not caused by any organism or pest, but as "produced most commonly, perhaps, by a long, dry season in the fall, causing the trees to become especially dormant, followed by warm, spring-like weather during the winter soon after the first rains. Again, they may be produced by long, continuous rainfall during the winter, followed by a very sudden end of the rainy season and a long period during the spring and early summer of hot, dry weather. These, and other irregular combinations may produce the effects described and other similar ones." It is evident that the trouble cannot be reached by sprays or other superficial treatments because there is something wrong with growing conditions. Your observation that affected twigs or branches do not recover gives new force to the old prescription that such growths be cut back severely in the hope of starting a more normal growth from some point lower down. This should be done in the spring as soon as it is seen that the growth is going that way.

Stacking Beans in the Field.

To the Editor: I am located near the coast, and this locality is subject to fairly heavy fogs. I have read considerable about stacking beans in the Eastern States and letting them go through a sweat of from two to four weeks. No one here that I have talked to has had any experience along these lines, and would appreciate your opinion on this matter. If they could be stacked safely, i. e., without danger of moulding, or spoiling in the rain, a part of the crop that is now lost every year by leaving in the field until the thresher arrived, might be saved.—D. J. M., Arroyo Grande.

That there should be a San Luis Obispo man who is willing to admit that he does not know all there is to know about beans, is evidence of advancing human humility. It is common, of course, in California, to leave the beans after cutting in small piles for curing more slowly, instead of drying to death as they would be apt to do in windrows; but stacking to shed rain and to go through a sweat has not yet come under our observation in this State. We would like to hear from any one who works in that way. Theoretically, it might be more dangerous to stack in this State because the fall heat is higher than elsewhere in the country and might therefore induce more fungus growth. But the only answer worth while will be from trial of the method. In case our correspondent may desire to try stacking, we give a method commended for Eastern Washington by L. W. Fluharty in Farmers' Bulletin No. 561:

"Stacking in the field before threshing is growing in favor since in this way a large acreage may be handled without danger of damage from rain. It is during the time the beans are lying in piles between cutting and threshing that there is danger of damage from rain. If stacked, such damage is not liable to occur, as the stacking can begin within a couple of days after cutting and the beans are left in piles only a short time. Another advantage of stacking is that the vines go into a sweat soon after they are stacked and do not become thoroughly dry for three or four weeks after the sweating process begins. While in the sweat the vines, pods, and seed become toughened and there is less danger of cracking than if threshed directly from the field. The stacks are built on a layer of straw 12 or 14 inches thick in order to keep the pods from coming into contact with the ground. The straw also catches the seeds, which are trampled out during the stacking process. The beans are separated from the straw by running both through the huller. The stacks are kept dry by covering them with heavy canvas. An excellent way to protect the beans until threshed is to cover them with straw. On the top of the stack the covering should be 12 or 15 inches deep. The straw is held in place by a network of wires or binder twine."

What Katydid to Oranges.

[Written for Pacific Rural Press.]

Spraying with arsenite of zinc or arsenate of lead is recommended by the United States Department of Agriculture as a weapon against the katydids, which are doing an increasing amount of damage each year to the orange groves in San Joaquin Valley of California.

Among the most important of these is the fork-tailed katydid. The angular-winged katydid, which closely resembles the fork-tailed species and is associated with it in orange groves, does much less damage than the latter insect. Both can be controlled by the same methods. The young of the fork-tailed katydid are found actively feeding on orange trees at about the time when the blossom-petals begin to fall. The insect sometimes attacks the blossom buds, gnawing a hole through the petals to reach the pistil and ovary. Quantities of the immature fruit destroyed in this way are frequently found on the ground when the infestation is at all serious. Oranges which have been only slightly chewed when small remain and ripen on the tree, but they are quite unfit for shipment and have to be thrown out. At picking time fruit damaged in this way will be found to have clean-cut circular holes in the rind which vary from the size of a 10-cent piece to that of a silver dollar.

The amount of dammage done in this way has been known to run to more than 50 per cent of the mature fruit, excluding the undeveloped oranges which fall to the ground. In 1912 several orchards lost a full fourth of their crop and in the same year an examination of 53 orchards of Washington navel oranges showed only 3 entirely free from injury from this source. In three of the others the injury amounted to less than 1 per cent and in the remainder it ranged from 1 per cent to 39 per cent of the mature crop. In one 6-acre tract of young navel trees a hundred boxes of oranges were discarded because of injury from katydids. Eight hundred boxes of good oranges were picked from the same plant, so that the loss in the mature crop amounted to 11 per cent in addition to the young fruits and blossoms which might have matured had the katydids not been present.

Spraying has been found to be the only practical method of control. The eggs are deposited usually in July and August between the upper and lower edges of the tougher leaves. At times the female eats a hole through the leaf and deposits her eggs at the edge of the hole. The period of incubation is long, averaging from 275 to 290 days, so that the insects do not appear in the intermediate or nymph stage until late in the following spring.

Both the fork-tailed and the angular-winged katydid are robust insects. For this reason, therefore, spraying, to be effective, must be done while the insects are still young. In a new publication of the United States Department of Agriculture, Bulletin No. 256, two applications of arsenite of zinc at the rate of 2 pounds per hundred gallons of water, or else two applications of arsenate of lead at the rate of 4 pounds per hundred gallons, are recommended. The first application should be made at the latest immediately after most of the petals have fallen, and the second application from 10 day to 2 weeks later. If there is an infestation of citrus thrips as well as of katydids, lime sulphur should be added to the spray at the rate of 2 gallous per hundred. A third application of lime-sulphur only, of the same strength, should be made about 2 or 3 weeks after the second spraying for the katydids. It has been estimated that the cost of spraying should not exceed, with careful management, $5 an acre.

Smoothed Ground Burns Prunes.

[Written for Pacific Rural Press.]

"I usually cultivate prunes until the limbs hang down in the way, the last cultivation being with a slab clod crusher which slicks off the surface. But I am a little afraid that this smooth surface gets too hot and helps to sunburn the prunes, turning their skins brown, and likely making them "bloaters" or "frog bellies," as we used to say, and the meat is likely to turn dark," says Dr. R. L. Hogg of the Santa Clara foothill country.

His neighbor has a system which appeals to Dr. Hogg, by which the last time over, the clods are mashed with a harrow made of three 6x6s, held together by 2x4s. Long harrow teeth over the 6x6s pointing diagonally backward break the glazed surface so that it does not reflect the sun heat so much and is soft for the fruit to fall on.

Meanwhile, before the prunes ripen in the second week of August, the drying yard equipment is overhauled. The dry yard is pastured through the year and short grass is left on it during the drying season to keep the dust down and small pieces of dirt from getting into the fruit when the trays are stacked. Having no irrigation, the grass is brown and the ground dry by fruit-drying time.

Poor Fruit Drops First.—Just before the good prunes begin to fall, Dr. Hogg picks up everything that has already fallen in his 35-acre prune orchard so as to leave the ground clean of fruit. If there is enough good fruit in the first picking, it is all dried, after which the poor ones are picked out—such as those which are russeted, cracked, sunburned, etc.

After a week or ten days, the fruit which has subsequently fallen is picked up and dried. The fruit ripens faster during the hot spell and sometimes keeps the pickers excessively busy. The third picking comes a week or ten days after the second, as a rule, and the trees are shaken slightly. Sometimes they are shaken the second time if the fruit does not fall fast enough. At the fourth picking, everything is cleaned as they go.

Most people in this section use the Anderson & Barngrover prune dip which grades the fruit into three sizes before drying, making the fruit dry more evenly and saving time on the small sizes and permitting the more frequent use of trays.

Dr. Hogg has a caldron containing 60 to 70 gallons in which he slushes the fruit up and down three or four times, perhaps half a minute, in lye water which is kept boiling. Three pounds of lye are put into the caldron to start with and more is added whenever the skins are not checking enough. If the fruit is left in the lye too long or if it is too strong, the prunes are likely to ooze after they have dried and stick together in the bin.

Grading Would Save Work.—By not grading into sizes before drying, Dr. Hogg has more work. He leaves the fruit in the sun until the small ones are about dry and the others about two-thirds dry. The trays are then stacked in the dry yard about 20 deep, about as high as two men can conveniently pile them. The stacks are endwise north and south with alternate trays projecting about 6 inches so that they will be open to the usual north summer wind. They dry slowly in the stack so are picked over at leisure. If most of the fruit on the tray is dry enough the wet ones are picked out and dried some more and vice versa, discarding at the same time any that are bad.

Test for Dryers.—The way many people test to see if the fruit is dry enough is to pinch between the thumb and finger. If the pit doesn't slip around within the fruit, it is dry enough. Sometimes it is dry enough even if the pit does slip around. If they are allowed to dry too long, the meat gets hard and much weight is lost, reducing the prunes to a smaller size and a consequently lower price. Sometimes if the sugar is well elaborated in the fruit, it may get sticky in the bin unless dried more than usual.

Paper for Drying.—Sometimes they get a big crop and need more trays—they did three years ago—and Mr. Hogg called at the store for "heavy white paper for drying prunes," four feet wide. This was rolled out flat on the ground and the prunes dumped directly onto it from boxes as they came from the dip. It wet the paper, but did not hurt it unless there was something underneath which would break through. Sometimes prunes have been half dried on trays and then dumped onto the paper, but this makes a sticky mess which has to be pulled apart with the fingers and laid out thin. Such handling at this stage breaks many of the prunes.

In using paper, one must be careful not to let the prunes get too dry, for they cannot be stored by stacking as they can in the trays, according to Dr. Hogg. This recalled the experience of C. B. Driver of Dinuba, who claims as one of the greatest advantages of paper drying trays for raisins, that they can be rolled up more quickly than trays could be stacked in cases of overheating or rain.

In the case of rain on the prunes, the trays are usually set up off the ground, the prunes stirred, picked over, taking out those that are dry enough, and "saving all you can." They are hauled to town in sacks. "A little over a ton per acre dried is a normal crop."

AMERICAN farmers are harvesting the greatest wheat crop ever grown in any one country. It may reach a billion bushels. Department of Agriculture experts have estimated the crop at 966,000,000 bushels, basing their calculation on the condition of the crop August 1. Bumper harvests of other cereals and food crops are indicated.

The department's August report estimates the production of the county's leading crops in bushels as follows:

Winter wheat	685,000,000
Spring wheat	206,000,000
All wheat	891,000,000
Corn	2,673,000,000
Oats	1,141,000,000
Barley	195,000,000
Rye	43,000,000
Buckwheat	17,000,000
White potatoes	406,000,000
Sweet potatoes	57,000,000
Tobacco (lbs.)	1,035,000,000
Flax	16,000,000
Rice	24,000,000
Hay (tons)	70,000,000
Apples	253,000,000
Peaches	54,000,000

1 1-2 Tons Raisins on Worn-Out Vineyard

[Written for Pacific Rural Press.]

A system of pruning and culture of grapes to increase their yield, which is falling off seriously in many San Joaquin valley vineyards, was described last spring as being developed by Frank Henry of Fresno county.

Mr. Henry recently brought a suitcase full of new Muscat shoots with well grown fruit on them into our office, showing where the new shoots had been pinched off, diverting the sap into at least two clusters per shoot, with several additional second crop bunches developed on the laterals which put out after the pinching. The berries on these second crop bunches were only a little smaller than the first crop, and Mr. Henry stated they would sugar up in considerably less time so they could be dried with the first crop.

The growth, which was said to be average for the whole vineyard from which the shoots were taken, was only about 2 feet long beyond the first crop bunches. They were taken from the 60-acre Muscat vineyard

about 35 years old belonging to C. W. Adams of Fresno county. In 1912, this vineyard yielding 90 tons of raisins. In 1913, it yielded 65 tons. In 1914, 45 tons, and the vines grew very little. The present crop is estimated by Mr. Henry at 90 tons, while the Japanese who contracted the crop estimates it much higher, about 60 per cent being bunches large enough for cluster layers.

The vineyard has been pruned to very short arms headed low down. Last March, Mr. Adams spent $110 digging the basins around the trunks in which the fruit would hang protected from winds and sun. He plowed the vineyard 10 to 12 inches deep, cutting the great mass of surface roots, developed because of a water table much closer to the surface than Mr. Adams had suspected. The vines were pruned late, bleeding the tops as the heavy plowing bled the roots, This, according to Mr. Henry, had the effect of making all the blossoms set berries; and certainly, the bunches shown were most compact. The crop, having set, shortly had the advantage of sap from the rootlets which immediately put out from the roots cut by the plow, and there is no suffering of fruit for sap.

Mr. Adams' vineyard looks to a casual observer to be in a backward condition among the luxuriantly growing vineyards roundabout, but the pruning and cultivation have set the energy of the vines into fruit, producing only enough foliage to support the crop and to develop plump buds for the next year's crop.

CO-OPERATIVE CITRUS GROWERS' ASS'N.

[Written for Pacific Rural Press.]

One of the most co-operative and thriving local associations we know of is the Santa Paula Citrus Fruit Association of forty-two lemon growers. They are members of the California Fruit Growers' Exchange for marketing purposes and of the Fruit Growers' Supply Company for the wholesale purchase of their supplies, including shook, fumigation materials, fertilizers, machinery, etc.

Their lemon curing and packing house, 90x429 feet, with a capacity of 70 cars' storage, consists partly of a large, new, recent addition which denotes prosperity. The Association does all of the lemon picking for its members and if asked by the growers will furnish spraying, fumigating, and pruning outfits and men, who make a business of going from orchard to orchard and doing this work in a business-like way for the Association.

When Manager C. L. Sheldon tells a grower his orchard needs attention, the grower is usually glad to have the Association's experienced men do the work.

It was only last winter that the co-operative picking began, but the members are now obliged to allow the Association to do that part of their work. Each picker puts his own number on the field boxes so he is held responsible for injury to the fruit. Each orchard is picked at least once a month for at least ten months in the year.

A new Bean Power Sprayer was obtained by the Association this spring to save duplication of investment for members. This is possible since spraying is not quite so seasonal as deciduous spraying. There are few spray rigs owned by growers themselves. A new fumigating outfit bought last year includes 66 tents, the necessary equipment, and two wagons.

BUTTE'S PEACH PROBLEM.

[Written for Pacific Rural Press by Oscar O. Oates.]

As far as the peach crop goes throughout Butte county this season, it does one good to ride through the orchards and view the heavily-laden trees.

A few growers, not being in a position to handle their own crops, are disposing of their fruit at a great loss—bulking at $10 per ton; but the larger part of the growers have refused to yield to the "hold-up" and are handling their own fruit, selling quantities to individual parties at one and one-half and two cents per pound; but the bulk is being cut, sulphured and dried right at home, trusting that the dried fruit market will be far better this fall than at present prognosticated. Several growers vouch they will ship their own dried peaches East in the fall to friends and have them sold direct to the consumer, giving the consumer the advantage of the situation, and perfectly satisfied if they receive five cents per pound—to break even and eliminate the "middlemen" being preferable to a forced yield at a great loss.

Judging from their general trend of conversation the peach producers are all of about the same opinion, realizing that now is the time for co-operation, and henceforth market their products direct to the consumer.

On the other hand, there is the pessimistic growers who intend after the crop is removed this season to dig up their handsome orchards and plant the orange, olive, grapefruit, lemon, etc.

This may be natural, and seem wise to the loser, but there should not exist a cause for the destruction of a single thrifty fruitful peach orchard in Butte county, for there is always a great demand for a staple fruit such as the peach when it can be marketed so that the masses—those of moderate means—can afford to partake. But when choice dried peaches are retailing through the winter at twelve and one-half and fifteen cents per pound, and the hard-working producer knows that he received from two to five cents for the same grade of fruit, there is a radical wrong which only the producer and consumer can doctor by strict co-operation.

Many of the canneries are not operating this season, and others making but short runs, claiming that they are overstocked with last year's goods. If this is one of the reasons, would it exist if the canned fruit were within reach of the average consumer? The producers should not only see that it is to their best interests to unite, but should likewise own and operate their own canneries.

Stating that they will have enough to do to care for the raisin crop, directors of the California Associated Raisin Company again turned down the request of the peach growers to handle their crops on the same basis as raisins.

YOUR FIRST STEP!

To Learn How **Radium Makes Things Grow**

is to send for our free illustrated booklet, outlining what has been accomplished on our experimental farm for three years.

RADIUM ore is mined in Colorado and Utah, pulverized and processed for concentration in Pennsylvania and the residue containing a definite proportion of **RADIUM** can be applied to any soil along with any suitable fertilizer. Doesn't take much and produces extraordnary results.

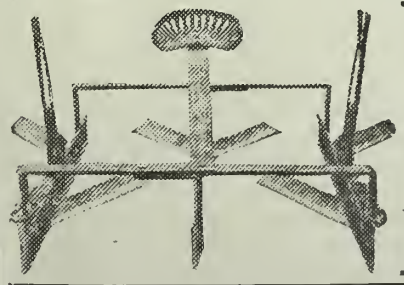
California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.



Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower,

Bosh About Bartletts.

To the Editor: I am sending you a clipping from an Eastern journal, the "Canning Trade," which alarms me somewhat, as I have been planting Bartletts with the conviction that he who fights blight can get crops, and I have gained that assurance from your columns. What have you to say about this Eastern proclamation?—Planter, Paso Robles.

[The following is the paragraph to which our correspondent alludes:

"To Destroy the Bartlett Pear.—There comes from the Pacific Coast a report that the fruit growers of that section are seriously considering the destruction of the Bartlett pear trees in that State, due to their peculiar susceptibility to disease. They are looked upon evidently as breeders of trouble, and as such must be destroyed. This may be a good economic movement, but we cannot see it. The Bartlett pear at its best is certainly the king of tree fruits, and from a canner's point of view particularly so. If, therefore, it be delicate and susceptible to disease, find the remedy or prevention, but don't exterminate it. That is the most retrogressive suggestion we have ever heard mentioned by a serious-minded body of men, and yet the Association of California Fruit Growers is credited with this action. Even the packing of 'sand pears' and their labeling as 'Bartlett' did not rob the public of its taste for the true Bartlett, and it is too good a fruit to treat as did the savages of Africa in Stanley's time, where they used to throw the sick over the stockade walls as food for the wild beasts of the jungle. A State that has produced a Burbank ought to be able to produce a cure for its best species of fruit, and we hope it will, and that the movement to exterminate will not succeed."

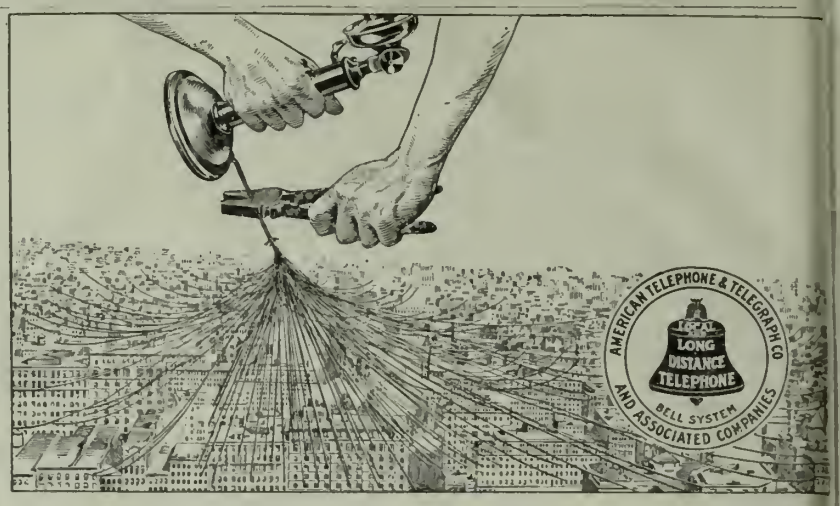
[The "report" made to the "Canning Trade" is absolute nonsense. It perhaps arose from the fact that our growers are making great efforts to find a blight-resistant stock on which to graft and bud the Bartlett so that the blight will not get into the roots. Some one may have said "the old pear stock must be abandoned," or something of that sort, and an ignorant reporter twisted it into abandonment of the Bartlett. We shall hang on to the Bartlett as firmly as ever, because there is no other pear which fully serves its purposes, and we are simply striving to get a better foundation for more Bartletts.—Editors.]

UNRIPE BELLFLOWERS CONDEMNED.

Warning has been sent out by the Watsonville Apple Distributors, an organization representing all the fruit interests in the Pajaro valley, by the following resolution adopted by the organization:

"Whereas, It has come to the notice of this board that several carloads of bellflowers have been shipped from this valley; and, whereas, these apples were not inspected by inspectors appointed by the State, and are immature and unfit for human consumption; therefore, be it

"Resolved, That the action of the packers and shippers in putting on the market Bellflower apples at this time too green for use is to be most severely censured as an attempt to deceive the consumer into the purchase of worthless stock; and that dealers and consumers alike be warned against the purchasing of bellflower apples unless the container shall bear a stamp showing that the contents have been inspected under the State law or by the inspectors of the Watsonville Apple Distributors, thus insuring maturity of the fruit and the honesty of the pack."



BRIDGE GRAFTING.

To the Editor: I had some grafting this spring and some malicious person cut away the bark of the stock clear around the tree and a foot high. There were 100 fine 4 and 5 year old trees which he tried to ruin, and no one knows his idea in girdling instead of cutting them down? We bridged over the barkless part with long scions and a good percentage are growing. This is the first time this bridge grafting has been done in this vicinity and I believe a good many gopher girdled trees could be saved this way. Will send some photographs when we can get to it if you care for them.—Reader, Sebastopol.

[We would like such pictures when convenient. This sort of grafting is frequently used to save trees girdled by mice under the snow at the east.—Editors.]

THE OLIVE SITUATION.

To the Editor: The writer has read carefully "Aspects of the Olive Industry" in your issue of the 14th inst. It is pertinent and well stated in the main, but a little more may be added and perhaps a slight error corrected. Suffice it to say the industry faces a crisis. It got off on the wrong foot. The product was valued too highly: in the nature of things it drifted into the realm of luxury: packers and growers both contributed to this condition of things. Growers received and packers charged all the traffic would stand. The result was, "a dish for a king," and not a wholesome article for the masses. Unfortunate was

If a Giant Cut the Wires

Suppose all telephones were silent, and that for forty-eight hours you could not even call a telephone exchange anywhere in the Bell System to ask what the trouble was!

Imagine the confusion which would prevail—with personal visits and messengers substituted for direct, instant communication; with sidewalks, street cars and elevators jammed; with every old-fashioned means of communication pressed into service and all of them combined unable to carry the load.

The instant contact of merchant with customer, of physician with patient, of friend with friend, would be severed; the business man and the housewife would lose the minutes and hours the telephone saves them. The economic loss would be incalculable.

There would not be time enough to do the things we are accustomed to do, and social as well as business life would be paralyzed.

Such a condition is almost inconceivable. The Bell System has developed telephone service to the highest degree of usefulness and made it so reliable that its availability is never questioned. It has connected cities, towns and the remotest places from coast to coast, and has taught the people the advantages of nation-wide telephone facilities.

Plans are made, buildings built and businesses run with Bell Service taken for granted, and yet we have to imagine what it would mean to be entirely without telephones before the great value of this ever-present service can really be appreciated.

the classification of the olive, and the oil was pronounced "medicinal," etc., instead of "fruit fat," with the usual sequence. Very few relish medicine and fewer still appreciate the merit and wholesomeness of this condiment and substitute for "animal grease"; hence this part of an ancient industry languishes and humanity suffers loss.

Your correspondent values olive oil at $2.00 per gallon, which is misleading, for we have it upon good authority that California olive oil has recently been offered delivered in eastern markets at $1.45 per gallon, in gallon cans. The seeming necessity for such slaughter of values is the fact that best foreign olive oil has been offered, delivered in the U. S., duty paid, at $1.15 to $1.25 per gallon. This is less than cost for good California oil in the olive. Taking the average price paid for the olives used for oil and the average yield per ton, one of two things will happen: either growers and laborers must compete with poorly paid foreign workers, or a protective tariff, amounting to the difference in cost of the article made at home must be restored to us.

This brings us to the organization of associations, and to the writer's mind it occurs that multiplication of them will but lead to confusion and hazard the solution of the problem. To the grower and packer alike is the situation grave and will take the co-operation of both to meet it, in a way mutually satisfactory. All together in California, with one accord, will work wonders and the experience of the past may be used as a stepping-stone to permanent establishment of felicity for this important industry. Publicity and protective ways and means must not be required of either grower or packer alone, but shoulder to shoulder all interested must plan and prosper, or failing in that invite disaster and disappointment, with growers and packers together; with standardization of grades and package; with a reasonable recognition of the consumers' relation to the industry (a wholesome article at a fair price); with consistent publicity, wider distribution, according to 20th century methods, the business can be placed on a sure foundation and afford remuneration to all branches thereof.

W. W. Hinsey,
Sec. Fair Oaks Fruit Company.
Fair Oaks, Sacramento county.

CALIFORNIA BARLEY: SIX TO TWO.

(Continued from page 193.)

from the growers' point of view, as Californians have always contended, but, from other points of view also, it is the type of barley which should be produced in this country. This conclusion of course brings him into certain conflict with the old two-rowed dogma and he found particular trouble after he had read an essay recently claiming that the official recognition of the six-rowed Manchuria and Oderbrucker by the United States Brewers' Association as standard barleys for Wisconsin was a downfall for the two-rowed types.

Dr. Wahl has recently explained more fully his views on this point, in the American Brewers' Review for July, 1915, and has supported his conclusion by citation of testimony from California dealers in barley and malt that Chevalier is rapidly going out of use in this state. In the Pacific Rural Press of August 14 (page 148) we gave the evidence of H. E. Clemens Horst on that matter. Mr. Horst farther explains why the six-rowed barley of California is preferred for export, in these words which Dr. Wahl quotes in his paper: "The fact is that England grows only or practically only two-rowed barley, but they find that it is advantageous to them to use six-rowed barley along with the two-rowed barley and all of the barley that they import from the Pacific Coast and all the barley that they import from some other countries is six-rowed barley and they prefer to import six-rowed barley than to import two-rowed barley. In other words, two-rowed barley that they grow at home answers their purpose but they need six-rowed barley and this they import."

This is very important as showing that California growers are warranted in growing six-rowed barley not only because it is better from a grower's point of view but because it is the type of barley that is required in the export trade.

Supporting this contention, and also interesting to California barley growers because it shows how certain quantities of their product are used, are the facts reported to Dr. Wahl by the Bauer-Schweitzer Hop and Malt Co. of San Francisco, as follows:

"There was harvested in California in 1914 nearly 8,000 tons of two-rowed Chevalier barley, and this year we expect to harvest less than 7,000 tons. The amount of this particular kind of barley has decreased each year for the last twenty to twenty-five years, and no doubt will continue to decrease, as it requires better land than it does to produce our regular Bay Brewing barley. This land is becoming more valuable and farmers realize a better profit by producing fruits of various kinds than by producing Chevalier barley.

"Of the quantity of Chevalier barley harvested in 1914, about one-third was used for malting, one-third exported, and the balance purchased by the various milling companies in San Francisco for the manufacture of pearl barley.

"No breweries on the Pacific Coast today use 2-row Chevalier malt for brewing. The malt manufactured from this 2-row barley has been exported to Mexico, Central and South America, and the Orient. These countries previously received their supplies from Europe and at first demanded all the 2-row Chevalier malt that we could possibly obtain, but we understand that as far as quality is concerned, our Bay malt is now replacing the Chevalier, and they do not intend to use any more 2-row Chevalier malt. We have obtained the same report from the Scandinavian countries, and have been advised from personal representatives from these countries that our Bay barley and Bay malt will never be replaced there."

This, then, is the reason why the score stands: California Barley: 6 to 2.

President Wilson has ordered 5,800,000 acres in Alaska thrown open to homesteaders. Warning, however, has been given that the land is not much fitted to agriculture.

Spalding-Robbins Disc Plows

"THE GROUND HOG"

With Patented Wheel Weights for Rough Country and Extra Hard Soils

MADE IN 2, 3, 4, 5, 6 and 8 FURROW SIZES.
Convertible to 1-Furrow Extra

SOIL NEVER GETS TOO HARD AND DRY FOR THIS PLOW. Plow your land dry. Do not wait for rain. It may not come till too late.

MR. FARMER, DO YOU KNOW that over 1,000,000 California acres were not cropped last season, largely because weather conditions interfered with plowing? Were you among the losers? Don't be caught again. With "The Ground Hog" no matter how hard and dry your soil, you can plow this fall before the rain sets in—insuring big crops. European demand insures you big prices.

BUY A GROUND HOG NOW. It will pay for itself this Season and give you a handsome profit besides.

We manufacture both Horse and Tractor plows. OUR PLOWS FOR SMALL TRACTORS work where other plows have been strained or pull to pieces.

Write for prices and full particulars.

Spalding-Robbins Disc Plow Co.

461 Market Street, San Francisco.

Knapp's Sub-Soiler

AND DITCHER

Breaks Up Hardpan and Plowpan

FOR ALFALFA LAND, it makes ready the soil as nothing else can. Cuts down deep and fairly pulverizes subsoil. When Knapp's Subsoiler has been used before planting alfalfa, you can get better results by irrigating once in 60 days than once a week where the hardpan has not been broken up.

IN SETTING FRUIT TREES—this implement makes digging the holes the easiest of tasks. Where trees are all ready planted it breaks up the plow-pan and allows the moisture to get down to the roots. Breaks a strip of ground from 3 to 4 feet wide.

BUILT SOLID AND STRONG—guaranteed for a 25 H. P. pull—and has been used behind a 35 H. P. machine.

GUARANTEED BY KNAPP—and that means a lot. Knapp's plows are known all over the Pacific Coast, wherever good plows are used.

DITCHER ATTACHMENT—with this attachment you can ditch as you sub-soil, making a ditch 2 feet deep and 4 feet wide.

WRITE FOR MORE PARTICULARS—ask us anything you want to know about the subsoiler and ditcher—and for names of those who are using it.

Mechanical Power on the Farm.

FEED GRINDING SAVES HAULING.

[Written for Pacific Rural Press.]

Growing feed, hauling it to town to be ground, and hauling it back for the stock often make ground feed more expensive per unit digested than whole corn raised and fed on the farm.

C. F. Peterson of Sonoma county raises corn and finds profit in grinding it and other feed for the cows, pigs, and poultry. The corn is kept in a slatted crib, by the side of which is a lean-to machine shed. Near the end of the crib is a corn sheller and a grain grinder, set one beside but behind the other, so that the belt wheels which run both are in line with the engine, one belt wheel being removed out of the way of the belt when the other machine is being run. The belts run through the side of the crib to a 6 h.p. John Deere engine set under the lean-to on three 6x6s bolted crosswise, on two 4x8s which are set edgewise and the ends cut sled-fashion so that the engine may be easily hauled to other parts of the place when needed for other work. The engine is braced against the corn crib by two 2x4s, and the machines are held in place by cleats on the floor. Additional protection against the weather is afforded the engine by heavy canvas.

BLOCK AND TACKLE BUTCHERING.

[Written for Pacific Rural Press.]

When we butchered hogs in the dead of winter on the farm back in Iowa, one straining job was lifting the more-than-200-pound hog into a barrel and sloshing it up and down in the semi-hot water, then pulling it out, and sousing the other end by the armstrong method.

R. H. Miils of Bennett Valley butchers all through the summer and winter for local markets, but doesn't strain his back lifting the carcasses. He hooks onto each with double-single block and tackle hung to the rafters, using a ¾-inch rope. With this he lifts the carcasses off the floor and scalds them in a half barrel at pleasure. One man does it more easily than two men could by main strength and awkwardness.

TRACTOR POINTERS.

[Written for Pacific Rural Press.]

"We use our tractor for plowing, harvesting, grading, or leveling the land, and would not do it any other way," says Garber & Jones of Tulare county.

"Our advice to others who might intend to get tractors would be not to buy too large a machine, but be sure also that you do not get one too small. Medium sized machines give better results, and we like the track laying types best.

"The intending purchaser should consider the width of the track, weight of the machine, and the convenience in getting new parts."

HILL SPRING FURNISHES POWER

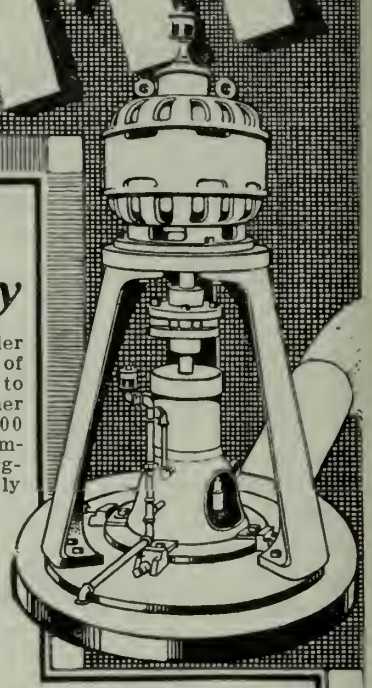
[Written for Pacific Rural Press.]

Power to milk, separate, and churn the cream from 36 or more cows has cost T. B. Roy practically nothing since about 1893, when he put a 160,000 gallon reservoir high up in the foothills above the dairy. An ever-flowing spring keeps this about full and the water is piped down to the dairy where it has a 50-pound pressure.

It is run through a half-inch nozzle into a Pelton water-wheel about 18 inches in diameter. The water-wheel runs a line shaft to the separator and to the milking machine pump. A belt also runs through the floor to the churn in the basement, where even in the driest time of the year over 200 pounds of butter are churned every week.

The waste water runs through a tank in which the cream is set to cool; for the churning comes only every third day at this season.

Another water-wheel with a ¾-inch nozzle and a heavy fly-wheel is attached to a grind stone in one direction and to a circular saw in the other. The fly-wheel makes it possible to rip out boards 10 inches wide without sticking the saw. The belt is run as loose as possible to reduce the strain on the bearings. The saw is also used for cutting stovewood for the house. A cord of dry wood has been cut through three times in 29 minutes. All that is necessary to start the engine is to turn the hand screw and no further attention is necessary.



GRINDS FEED AT HOME.

[Written for Pacific Rural Press.]

Ground feed is more economical for hogs than whole grain or rolled barley on account of the husk, which prevents the action of the digestible juices and the grains pass through whole. E. C. Rand of Sonoma county has a machine which grinds corn on the cob, and barley too, without changing adjustments. This ground feed is especially needed since he disposed of his cows.

A 6 h.p. Woodin & Little engine runs the grinder and a line shaft which runs into the separator room, though the separator is not now used. In the opposite direction from the grinder and outdoors is a circular saw for the wood needed at the house.

Layne & Bowler PUMP

Direct or Belt Driven

Any Capacity

This pump posseses a much wider range of capacity than other types of deep well pumps. There is a size to meet your particular needs whether you desire to produce 200 or 4500 gallons per minute. The most competent water engineers and the largest irrigators in the West highly recommend the Layne & Bowler pump for all requirements. Why? Because its principle of construction is absolutely correct, and it will positively produce the largest amount of water at the lowest cost. You will be doing a wise thing by installing this pump, and remember—a good pumping plant is the best crop insurance policy you can be protected with.
Our new valuable irrigation booklet No. 25, just published, tells all about this wonderful pump and gives other valuable information about irrigation. Write at once for a copy. It's free.

See our big exhibit of pumps in the Palace of Machinery, San Francisco Exposition. Every rancher and prospective irrigator should see this interesting exhibit.

STEAM BOILER ON DAIRY.

[Written for Pacific Rural Press.]

On a grain ranch it is no fun to turn the grindstone to sharpen the sickles; it is no fun where all of the wood used on a ranch is grown and chopped on the place, to sharpen the axes; and where a great deal of milk is handled it is no fun to keep the water hot and handle it in washing the utensils.

John Lynch who has a combination dairy and grain ranch in the hills west of Petaluma gets this disagreeable work done easily. A steam boiler furnishes steam to heat the water in the dairy cans, buckets, separator, and other equipment, and to sterilize them afterwards; and it furnishes power to separate the milk, saw wood and supply itself with fuel, and the house also, and to run the grindstone.

It is a small upright boiler and it runs a little upright steam engine for the power, and supplies steam through a pipe to the screened separator room. The steam is directed into the cans and other utensils as desired by a rubber hose on the end of the pipe; a light belt over the doorway runs the separator, steam pipes in the other direction extend to an open shed where the cans and buckets are washed.

Being so far from town and so high above it, coal would be as expensive by the time it is hauled to the ranch as it is disagreeable to the housewives; and since most all the wood is grown on the ranch, the engine and circular saw and the grindstone solve the problem of cheap, easily-obtained fuel.

ENGINE AND PUMP ON TRUCK.

[Written for Pacific Rural Press.]

An engine and pump fixed up for use on various parts of a large farm was operated recently by C. H. Pachett of Alexander Valley to save his alfalfa from untimely death by pumping from a big, shallow well dug in the center of the patch and distributing the water by way of canvas pipes.

A 3-inch Krogh centrifugal pump is set on a 4x4 and a 4x6 on the back of a small truck, having a 2-inch plank bed. A 6 h.p. Root and Vandervoort engine is set on the same timbers over the front wheels. It runs a pump by a short 6-inch rubber belt crossed between engine and pump to get the greatest bearing surface on the two belt wheels. Two horses move the outfit to whatever parts of the ranch it may be needed.

MAKES SEPARATING EASY.

[Written for Pacific Rural Press.]

Five gallons of gasoline separates the milk for five weeks in this dry season for W. J. Farley of Marin county, who has 50 cows altogether, though many of them are dry now.

The separator has a capacity of 1200 pounds of milk per hour, the power being furnished by a Baker & Hamilton 2½ h. p. engine. A line shaft also runs a green feed cutter for the poultry. Sixteen sows now get the benefit of the skim milk, but in the spring when the grass is green and more cows are fresh, they have 60 or 70 pigs, so that the milk separating would be no small task.

Growers of San Jacinto and Hemet are considering the erection of a co-operative cannery and pre-cooling plant.

Make *Rain* While the Sun Shines

Nature rarely sends rain exactly when and in the quantity needed. Therefore, artificial watering of crops is essential to successful farming. The secret of prosperity on the farm is to be able to "make rain while the sun shines."

G-E ELECTRIC MOTORS FOR RANCH AND FARM

are the best form of crop insurance. These motors are ideal for driving irrigation pumps because they are always ready to run, do not get out of order and require practically no attention.

After the irrigation season is over the pump motor can usually be used to run other farm machinery at great saving of time, labor and expense.

THE JOHN DEERE PLOW CO. OF SAN FRANCISCO.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

F. O. Popenoe of Altadena has 40,000 avocado trees, mostly of the nursery stock.

A date growers' association has been formed at Coachella in Riverside county.

Valencias from the Ford Ranch near San Fernando recently sold in Boston for $5 a box.

An up-to-date packing house is to be built at Porterville by the Mid-California Citrus Association.

Fumigation for black scale will shorty commence in Riverside county and continue until after the first of the year.

The cost of fumigation in Tulare county is much higher this year than last on account of the price of cyanide having increased.

Seventy-five per cent of a normal yield of early navels will be shipped from Tulare county this fall, according to a report just received.

The Associated Orange Distributors of Southern California have leased a large packing house at Porterville to be ready for the fall business.

An effort is being made by the California Fruit Growers' Exchange to secure the endorsement of the Butte county Citrus Association for the continuance of the eight-to-one test for oranges, to which they were opposed.

DECIDUOUS FRUITS.

A full crop of prunes is reported for Glenn county.

Colusa prune growers expect the largest crop in many years.

The first car of the new peach pack left the Porterville cannery for Chicago last week.

Grass Valley is shipping the first Bartlett pears from that district to the eastern markets.

A good prune crop is reported from the orchards about Healdsburg and northern Sonoma.

The Porterville Cannery recently made a new record of 41,645 cans of peaches in one day.

A carload of prunes daily is being received at the packing house of Miller & Gobbi, Healdsburg.

On the ranch of E. B. Miller near Hanford a freak combination of peach and nectarine was grown.

The many independent drying plants in the vicinity of Yuba City have commenced a busy season.

Growers in the Palermo and Wyandotte sections of Butte county have commenced drying their peaches.

New South Wales imports great quantities of American apples, according to a recent commerce report.

The first box of inspected apples from Pajaro Valley were shipped last week by Raphael & Murphy of Watsonville.

One hundred tons of Bartlett pears from 15 acres near Modesto have just been harvested by Mrs. Katherine McClure.

Persistent work is being done by County Horticultural Commissioner H. P. Stabler, in fighting the tree and vine pests throughout Sutter county at this time.

GRAPES AND SMALL FRUITS.

The raisin grape crop in Fresno county vineyards is now ready for the pickers.

The prospects are for a fair crop of grapes in the Gilroy section of Santa Clara county.

It is stated that a car of Dinuba Malagas brought $1,290.55 on the Eastern auction market.

The Pacific Fruit Growers' Exchange of Sacramento may purchase the Arbuckle Tokay crop.

Large shipments of Thompson Seedless grapes are daily being made from Atwater, Merced county.

The Kings County Packing Company at Armona has canned 50 tons of grapes as an experiment.

On August 17, about 4,000 Japanese laborers commenced picking the Malaga grape crop in the San Joaquin valley.

The grape crop from northern California is reported to be but 60 per cent of normal on account of mildew damage.

Cleanliness is the best means of eradicating the raisin moth, according to Prof. Bioletti of the University of California.

The great winery plant on the Stanford Ranch at Vina was completely destroyed by a fire of unknown origin recently.

Tulare county has the heaviest grape crop in years; and as the product is the first on the eastern market, the prices are above normal.

A heavy demand for seedless raisins is expected by the California Associated Raisin Company, England having already sent over a large order.

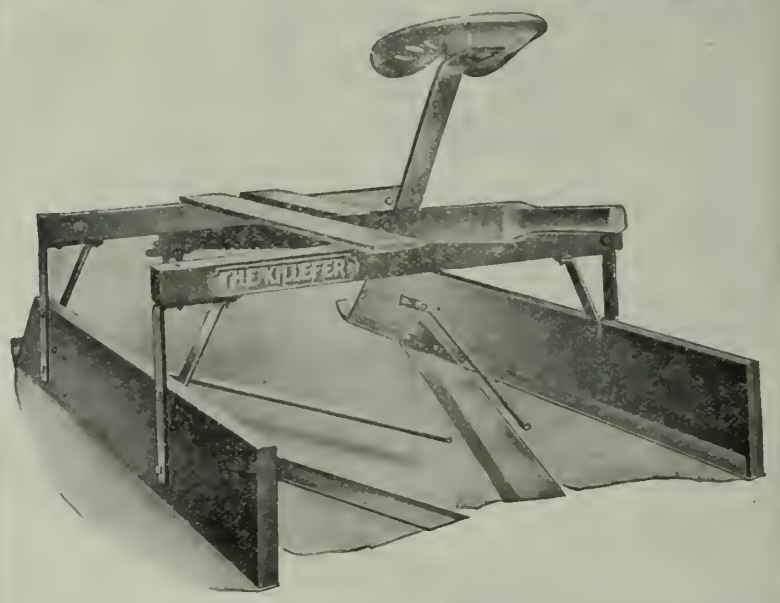
One thousand tons of Sun-Maid raisins will shortly leave Fresno for eastern points, being shipped by the California Associated Raisin Company.

It is the opinion of the officials of the California Associated Raisin Company that the entire 1915 crop of seedless raisins will have been sold by August 23.

It is stated that 200,000 acres of vineyards planted with European vines have been destroyed in California by phylloxera since its introduction into this country.

On August 18, 1915, the California Associated Raisin Company of Fresno sent out Price List No. 9 covering the 1915 crop, effective August 19, 1915. Prices on Thompson Seedless and Sultanas will be as follows: 50 lb. cases, 6¾c; 1 lb. packages, 7¾c; 12-oz. packages, 6¼c. Sultanas, 50 lb. cases, 6¼c; 1 lb. packages, 7¼c; 12-oz. packages, 5⅞c. The above prices are for capstemmed and recleaned stock. Above prices guaranteed to December 31, 1915. Goods not shipped by December 1, 1915, must be paid for at that time. Bleached Thompson Seedless Raisins from the Marysville and Yuba districts, Extra Fancy, 50 lb. cases, 8½c; Fancy, 50 lb. cases, 8c; Choice, 50 lb. cases, 7¾c. The prices on Bleached Thompson Seedless Raisins will not at this time be guaranteed, not knowing to what extent bleaching may be done in the San Joaquin Valley.

OLIVES AND NUTS.



The harvesting of almonds has commenced in the Yuba City district.

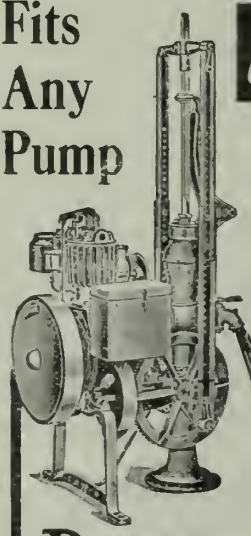
Almonds are being harvested in the Oakdale section of Stanislaus county.

Killefer Bean Cutter (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

A Bean Harvester is used only a few days each season, and we have found, after building various styles of Wheel Harvesters, that the rancher preferred a strong simply made Sled Cutter.



The work done by this tool cannot be excelled and is seldom equalled by any of the so-called Adjustable Harvesters on the market.

Extra Blades for all styles of Bean Harvesters are carried in stock.

The Killefer Manufacturing Company

2209-21 Santa Fe Avenue, Los Angeles, Cal.

Fits Any Pump

Power

The Farm Pump Engine is also a complete power plant in itself. Relieves you of turning cream separator, churn, washing machine — in fact, anything that can be hitched to it. Runs steadily and easily and without vibration.

FREE BOOKLET

Let us explain in detail just what this pump can do and why it will pay you to own one. Send for our free booklet.

Pacific Hardware & Steel Co.

702 7th St., San Francisco

Los Angeles Portland

All You Want Of It

FROM 270 TO 2450 GALLONS OF WATER PER HOUR WITH THE

Fuller & Johnson FARM PUMP ENGINE

This Farm Pump Engine has been rightly called "the mainspring of the farm." Can be attached directly to any pump without extra fittings, special platform or foundations. It works in any kind of weather and will supply all the water needed for home or stock in the hottest and calmest days—for household or garden use—for washing buggies—fighting fire—for cooling porches—sprinkling lawns, etc.

No extras to buy. Comes complete in one crate, ready for instant use.

Remember there are 73 years of honest manufacturing experience behind this

Farm Pump Engine

It is not to be compared with cheap articles of the same sort, which are built merely to sell. This engine is guaranteed and once you use it you'll say it's the best investment you ever made.

Our Low Price will surprise you.

Water

An olive pickling plant on a co-operative basis is under consideration by Oroville olive growers.

It is estimated that the Durham Almond Growers' Association has purchased 250 tons of almonds from its 110 members.

GRAIN AND FIELD CROPS.

A bumper rice crop is predicted for Colusa county.

California's rice crop is estimated to be twice as big as that of 1914.

It is estimated that Kings county 1915 alfalfa will be worth $2,500,000.

Cuba's sugar crop is estimated at four million tons at the present time.

Alfalfa hay in the vicinity of Modesto is selling for $7 a ton in the shock.

A large crop of beans is being harvested in the Delano district of Kern county.

Beans will be harvested in the Oakdale section within a couple of weeks.

France has authorized the purchase of at least 20,000,000 bushels of wheat.

About twenty cars each of cantaloupes and watermelons leave Turlock daily.

Experiments in Sudan grass growing in Sutter county are reported successful.

Atwater is shipping sweet potatoes to the Coast markets, growers receiving $2.50 per cwt.

The Beaumont bean season is in full swing; fully 400 acres are expected to be harvested.

It is estimated that Imperial Valley shipped $3,000,000 worth of cantaloupes this season.

The prospects are reported to be excellent for a good rice crop in Yuba county this season.

Thirty thousand slabs of spineless cactus were recently shipped by H. R. Timm of Dixon to Fresno.

E. I. Feemster of Hanford has produced a white tomato which he says is superior to the red variety.

Sonoma county hop growers are endeavoring to employ nothing but home labor in their fields this season.

The Santa Cruz Land Company recently purchased 523 acres near Oroville, expecting to plant the tract to rice.

Beans are being harvested in Kings county; prices varying from 5 to 7 cents a pound were easily obtained.

One thousand tons of beans grown on the Sacramento river bottom lands were recently shipped to the European markets.

Although the California alfalfa crop may not come up to expectations, seeds will be more abundant than in 1914.

Large shipments of alfalfa to the East are reported from Hanford by the California Alfalfa Growers' Association.

One thousand tons of alfalfa hay were recently bought from the Glide Ranch at Dixon by the Dixon Milling Company.

Practically all of the late sown beans around Sacramento are reported to have been destroyed by wire worms.

A mammoth cucumber, eight feet long and five feet around, has been produced on the farm of S. P. Gregory of Selma.

Twenty prominent lima bean growers recently met at Santa Ana to devise means of getting better prices for their product.

Ralph Barker of Lockeford is the winner of the potato growing contest of the Boy's Farm Club of the Lodi Union High School.

Orange county lima bean growers are endeavoring to form a co-operative association for the purpose of marketing their product.

It is stated that California's potato crop will be one-fifth less than it was five years ago; the decline is due to a fungus attack.

A meeting of potato growers of Sonoma county is to be called for some time in September by the State Horticultural Commissioner.

The Biggs rice crop is reported to be looking fine with prospects for a bumper crop. The season is about two weeks earlier than last year.

With a large increase in dairy herds and a considerable less acreage planted, Stanislaus county faces an alfalfa shortage this season.

A report from Sacramento states that grain shipments from California to foreign ports are held down considerably on account of lack of ships.

Twenty cents a pound for new hops was the price recently paid in Santa Rosa for product from the Madison & Ballard fields of Mendocino county.

Judging of potatoes entered in the contest of the Chico High School Agricultural Club has commenced; the winner will be announced within a couple of weeks.

In the sub-irrigated lands of Yolo county, the alfalfa season is practically over on account of drying out of the land. The season has been cut short two months, only four crops having been cut.

MISCELLANEOUS.

Frank B. Edson has been appointed Bee Inspector of Yolo county.

Placer county's new farm adviser, E. O. Amundsen, arrived in Auburn Aug. 19.

Butte county land owners have been ordered to rid their premises of Russian thistle.

A large tract of land belonging to Miller & Lux at Berenda, Madera county, is to be colonized.

It is planned to make the San Joaquin Valley Counties' Association a permanent organization.

Dudley Moulton has been appointed County Horticultural Commissioner of San Francisco county.

The first tractor in Nevada county made its advent recently on the Loma Rica Ranch near Grass Valley.

The subdivision of the Thos. D. Orr ranch of 800 acres in Mendocino county into 10 and 200 acre tracts has taken place.

An agricultural experiment station is to be established at the California Polytechnic School, San Luis Obispo, in connection with the University of California.

The Buena Vista Farm Bureau of Nevada county was recently reorganized and new officers chosen for the ensuing year.

A list of 372 individual prizes has been prepared by the Committee on Awards of the Merced District Fair at Merced in September.

Water users of the Palermo district of Butte county have formed the Palermo Water Users' Association, with 500 acres already signed up.

Active work is being done by the various committees in charge of the State Fair at Fallon, Nev., during the week beginning September 20.

August 23 was Tehama County Day at the Panama-Pacific Exposition; and Southern California Counties Day was celebrated on August 26 and 27.

With the supply of water lower than it has been for many years, farmers in the irrigated sections of Merced county are facing a very serious problem.

ORCHARDISTS find sand cultivation difficult. Until a recent date no suitable tractor had been placed on the market that met this peculiar condition.

THE YUBA BALL TREAD TRACTOR has met and successfully overcome this difficulty. Its distinctive features have made this possible.

The Ball Tread does not sink in the sand. The balls are large enough to crush any particles of sand that enter the ball race. The compactness of the machine permits it to run under the fruit-burdened branches without injuring them.

The unique transmission allows the machine to get close to the trees and eliminates one man from the plow; because the full power of the motor can be thrown on one tread it is unnecessary to lift the plow in going from one row to anotner.

Yet the Yuba Ball Tread Tractor has power enough to work equally as well in heavy adobe soil as in the shifting sand.

California's Opportunity for Dairymen.

[Written for Pacific Rural Press.]

TO IMPROVE THE QUALITY OF CHEESE.

In our issue of August 7, it was pointed out that both the manufacturing and marketing of California cheese was in poor condition. Since that issue we have received the following communication from the San Francisco Wholesale Produce Exchange which shows that immediate steps are to be taken toward the developing of the cheese industry. The communication is as follows:

"The condition of the cheese market, in so far as the California product is concerned, is unsatisfactory in the extreme. California cheese sells at a discount here in competition with Oregon, Wisconsin and New York cheese. It should be understood that California cheese is not manufactured by the same process that is used in making cheese which comes from other States. There is a demand in California cities for California-made cheese. Formerly there was a demand in the Hawaiian and Philippine Islands and the Orient for California-made cheese. Such is not the case today; those markets have come to prefer Oregon and Eastern cheese. The reason for this preference is not because the cheese comes from other States, but because it is manufactured by a different process. Over 99 per cent of as 'hand-stirred or 'stirred curd' cheese, while all the cheese which comes to San Francisco from other States and which is exported from this market is made by what is known as the "Cheddar" process. The result of this condition is that all cheese made in California by the hand stirred process must be consumed within the boundaries of the state. It is impossible to find a market for it elsewhere. This explains the difference in market prices and why cheese making in California is becoming unprofitable.

"Cheese makers can obtain a higher price for their cheese if they will adopt the Cheddar process, and the industry can be increased by the merchants regaining the export trade which has been lost in the past few years. The difference in price between 'California Old Style' and 'Cheddar Type' cheese at the present is about 1½c per pound, but the average difference based upon a year's figures is from 3 to 4c per pound.

"Realizing that a continuance of present conditions must result eventually in the elimination of California cheese, the San Francisco Wholesale Dairy Produce Exchange has established a classification for California Cheddar Type Cheese whereby cheese made by the Cheddar process, such as is used in the manufacture of cheese in Oregon and other states, may now be purchased and sold at its true value on the San Francisco market.

"The cheese factory on the farm of the University of California located at Davis has been making some cheese of the Cheddar type. This Exchange has carefully investigated and has tested the quality of the cheese made at University Farm. We are pleased to be able to state that the result of our investigations satisfies us that Cheddar Type cheese can be made in California of a quality equal, if not superior, to the quality of Cheddar Type cheese made in Oregon or the Eastern states.

"We earnestly urge California cheese makers to investigate this subject, learn to make Cheddar Type cheese and proceed to establish themselves as manufacturers of this kind of cheese. The Exchange has created the machinery by which such cheese will be recognized and sold at its true value and the College of Agriculture is ready and willing to give all necessary instructions and advice. Cheese makers are respectfully urged to correspond with Prof. H. S. Baird, Division of Dairy Industry, University Farm, Davis, Cal., for complete detailed information."

BEST SEASONS FOR COLT FOALING.

To the Editor: May I ask if there is any serious objection in breeding a mare so that she will foal in midsummer? It is pretty warm here in summer. I have only to mow and haul hay in summer and can get plenty of neighbors to help me at that, but in the fall and spring I have the heavy work of plowing, planting, etc., when the weather is favorable and neighbors' horses are not available. So I wondered whether it would be all right to breed a mare in August if she would take the stallion.—Subscriber, Tehama county.

in hot sections do not do as well as either spring or fall foals. The heat and flies seem to combine in retarding a rapid growth, but aside from that there is no reason we know of for not breeding in August. If your fall work does not start till after the fall rains it would be preferable to breed for fall foaling, say in October. By the time your real heavy work commenced in, say, December the colt would be old enough to permit of working the mare if you provided some feed for the colt. Fall foaling is not considered so desirable as spring foaling as there is very apt to be a lack of exercise provided for the colts in winter.—Editors.]

PASTEURIZING OR TUBERCULOSIS TEST.

To the Editor: I am in the dairy and milk delivery business. At the present time I sell my milk in bottles. My cows are not tested for tuberculosis. By the the new law I will have to have them tested or pasteurize my milk and I am in doubt as to which method to follow. Now, if a person has his cows tested there are many ways by which the milk may become contaminated from the time it leaves the cows till it gets to the consumers. I think that it may be wise to pasteurize, but I don't know whether my sized dairy will stand the expense. I am selling the milk from 10 cows now and will be selling from 12 or 14 in the winter. Could you let me know about the initial cost of a pasteurizing plant? I get six and a half cents a quart for six months of the year and seven and a half cents the other half. Would I have to increase the selling price in order to pay the running costs of pasteurizing?—H. W., Sonoma.

[The initial cost of a pasteurizing plant depends solely upon your conditions. A pasteurizer with a capacity of 50 gallons costs about $200. This does not, however, include boiler, sterilizer or refrigeration plant, which would very likely run the total cost up to about $750. The interest and depreciation on such a plant, together with the cost of operation, would either have to come out of your present income or be added to the selling cost of your milk.

Pasteurized milk sells for 10c. a quart in the larger cities, so we see no reason why your customers should not stand the additional cost. That however is a matter for you to decide.

It would doubtless be far cheaper for you to have your herd tested for tuberculosis and sell the reactors. The cost of testing depends largely on the veterinary; the usual charge we believe is one dollar a head where the entire herd is tested. It is pretty generally supposed that the law you refer to will be modified, so we doubt the advisability of installing a pasteurizing plant solely on that account.

If you feel obligated to install a pasteurizer on account of your milk not being of good quality we would suggest that it would be cheaper and more satisfactory to hunt up the cause of contamination first. You will, we believe, find that it isn't so much a matter of equipment as it is one of cleanliness in handling. A clean dairyman can usually produce clean milk under adverse conditions, but a dirty one can not produce clean milk under the most ideal sanitary conditions. It is largely a matter of individuality.—Editors.]

1st Prize 2-year-old Cal. State Fair 1914.
Segis Pontiac de Kol Burke
The bull that combines the blood of the greatest producing families in Holstein history. He is an outstanding individual, weighing 2200 at just three years of age. His dam RIVERSIDE SADIE DE KOL BURKE, is the heaviest milker that the breed has ever developed. She and six of her sisters have records above 30-lbs. butter in seven days.
A few sons of this sire are now available, some of which are soon ready for service. Several are from half sisters to Aralia De Kol, 30-lbs. butter in seven days at 12½ years, 28090 lbs. milk and 1112 lbs. butter in one year. Prices reasonable.

Is Prickly Wild Lettuce Poisonous?

An interesting question to stockmen is whether this plant is as bad as its reputation. Recognize the plant by the picture and description, and please write to us about what you are sure of about it.

To the Editor: The writer is enclosing a small piece of a plant which is new in this section, and from its rank and persistent growth it might become troublesome. We would like to know through your paper what it is, and if dangerous to stock. An old stockman just from Idaho told me it was known as "Chinese lettuce" in Idaho, and it was certain death to sheep if eaten by them, and that it has become a great drawback to farmers in their wheatfields by growing so rank as to kill out the wheat. Any information will be appreciated and thankfully received by your old subscriber.—C. P. Gould, Parkfield.

[Answered by Prof. P. B. Kennedy, University of California.]

The plant is Prickly Wild Lettuce (Lactuca scariola, var. integrata), and a close relative to our common garden lettuce. It is an introduced weed from Europe, and occurs from Nova Scotia to California, usually in vacant lots and waste places, but occasionally troublesome in fields.

When the plant is young the vigorous, and somewhat prickly leaves twist around during the day so as to keep the edge directed towards the sun, and for this reason it has also been given the name of Compass plant. The seeds bear a parachute-like apparatus by which it is easily carried about by the wind, and this, no doubt, is responsible for its wide distribution.

The plant reaches a height of from three to five feet, with a strong and long tap-root. Usually it produces only one main stem, but this is before going to seed, as with a mower it will send out from near the base several shoots of stems, all of which will reach maturity. Where cultivation can be carried on, as in intertilled crops or by summer fallow, no difficulty should be encountered in eradicating the plant, providing no seed is allowed to mature in near-by localities.

Cattle, sheep, and horses eat it quite readily when young. Its milky juice contains a substance commonly called lettuce-opium, which has been used in medicine as a mild sedative. The cultivated lettuce, after it has gone to seed, also contains this milky juice and the lettuce-opium, but in milder form. This, no doubt, is responsible for the general idea that eating large quantities of the garden lettuce makes one sleepy.

Now, as to whether the wild lettuce contains sufficient lettuce-opium to be poisonous to stock does not seem to be definitely known. Its wide distribution throughout the country, with no recorded instances of its being poisonous, would lead one to conclude that under ordinary conditions it is not harmful. The leading publications on poisonous plants do not make any statements in regard to this point, although some of them go so far as to say that it is said to be poisonous without giving any further data or specific instances in which any animals were known to have been poisoned.

I have myself seen sheep eat large quantities of this plant without any apparent ill-effects. If the inquirer has a sheep that he could spare and could feed it with this plant, he would be doing a favor to science as well as to the stockmen.

Prickly Wild Lettuce.

We would be pleased to hear more from the party from Idaho who considered it certain death to sheep.

It is generally recognized that this plant, as with nearly all plants with bitter milky substances, that if eaten in large quantities the milk becomes tainted.

GETTING WATER ON THE CATTLE RANGE.

The ordinary cattle range is more apt to be underwatered than overstocked, in the opinion of G. W. Barnes of the University of Arizona, who points out that the water supply on some ranges is so poorly located that the stock are required to walk long distances to quench their thirst, while other ranges are so poorly supplied that they are practically worthless for grazing purposes.

In locating the watering places several things must be taken into consideration concerning the character of the range over which the stock is compelled to travel to reach water, that is, whether it be mountainous or level, rocky or timbered. In mountainous or rocky districts stock should not be made to travel to exceed ½ to 2 miles for water, while on level ranges they may go as far as three miles. Of course when compelled to do so they will travel much further than this, but when they are compelled to exceed these distances, they are apt to enter the winter season in very poor flesh.

Greater and better development of the natural range water supply must be given attention by the stockmen. Windmills may be used with drilled or dug wells in connection with reservoirs large enough to support from 300 to 500 head per day at a very small cost, when the price of cattle is taken into consideration. Up to a depth of 500 feet the cost for drilling is about $1.00 to $2.00 per running foot, the casing will cost from 50 cents to $1.50 per running foot, and a windmill with cylinder, pipe, tower, etc., will cost about $125 to $300, making the well complete cost from $500 to $1000.

In order to improve the quality of their cheese, some 15 dairymen in the vicinity of Gonzales and Soledad have employed Albert Ely, an expert cheese maker of New York, to show them how to turn out a better product.

100 HEAD 100

Complete Dispersion Sale

OF THE

HOLSTEIN - FRIESIAN HERDS

of T. J. Gilkerson, Lemoore, and Heenan & Weldon, Sacramento, to be held at

Hanford, September 15th

80 head of cows and heifers, bred to the best young bulls in the West. The two herd sires, **Juliana De Kol King Segis** and **Prince Gelsche Walker Korndyke**, will be sold. Never again will the public be offered an opportunity to buy two bulls bred like these.

18 Granddaughters of the great sire **King Segis.**

6 Granddaughters of **Pontiac Korndyke.**

3 Daughters of **Admiral Burke.**

9 Daughters of cows with records of from 15 to 25 pounds butter.

6 A. R. O. cows, one of whom has an A. R. O. daughter. A fine young daughter of Juliana De Kol King Segis.

Several cows that are capable and will make A. R. O. records up to 30 lbs. The best bred and the best type of Holsteins that will be offered at the Fall sales.

20 young bulls from A. R. O. cows and sired by bulls from the Korndyke and King Segis family. 12 of them past yearlings ready for service.

Taken altogether, it will be a quality sale.

All animals over six months old tuberculin tested.

Catalogues will be ready about September 1st.

DAIRYING.

There are over 21,000,000 dairy cows in the United States.

There will be no National Dairy Show at Chicago this year.

E. E. Freeman, a Holstein breeder of Modesto, is planning to erect a silo in the near future.

A cow testing association is under consideration by the dairymen of Oakdale, Stanislaus county.

Milking machines have been installed on the dairies of A. J. Warnock, and Drayer & Son of Tipton.

The various creameries of Kings county paid $160,000 for butterfat delivered to them by the dairymen during July.

H. H. Sturill of Salida has secured a fine start in Holsteins and promises to make some good records with them soon.

H. E. Tong of Modesto has most of his cows freshen in the fall in order to take advantage of the high price of butterfat.

The Orland Cheese & Butter Company of Orland has transacted over $20,000 worth of business since its organization last April.

A co-operative cheese factory started at Satsop, Wash., in April is now receiving 7,000 to 8,000 pounds of milk daily.

Dot's Marie, a 12-year-old registered Jersey on the Hayworth Ranch, Modesto, is now making 40 pounds of 5 per cent milk daily.

Tulare county dairymen received $86,693 for cream delivered during July, quite an increase over the same month last year.

G. U. Clark of Hanford recently purchased the registered Holstein bull, Juliana King Korndyke, from B. F. Anderson of Modesto.

J. R. Pearson of Modesto is preparing to buy a few registered Holsteins and hogs; he believes the better the stock, the bigger the profits.

The Stanislaus Creamery at Modesto is churning 4,000 pounds of butter daily; and is also shipping to San Francisco 500 gallons of sweet cream every day.

The Creamcup herd of Holsteins belonging to Miss M. Holdridge is being tested by Earl M. Dobbs, sent out by the University of California for the Holstein-Friesian Association.

F. P. Olmstead of Stanislaus county has recently had erected on his farm northwest of Modesto a 50-ton silo. Mr. Olmstead is gradually working into the purebred Jersey business.

C. T. Morse of Modesto, a young Holstein breeder, reports that one of his cows produced in 10 months 437.4 pounds fat; another, 397.4 pounds in 11 months; and a third, 370 pounds in 10 months.

Artis Belle King, a two-year-old Holstein owned by B. F. Anderson of Modesto, made 10.46 pounds butterfat in 7 days. Nine months later, she produced 9.16 pounds fat in 7 days or only 1.3 pounds less fat.

Great success is reported for the Co-operative Creamery at Petaluma, 463,466 pounds of butter having been made the first six months of this year at a cost of one and one-half cents per pound.

Contrary to rumors, the condensed milk plant of the Alpine Evaporated Cream Co. of Gonzales, has not been sold. But as the market is overstocked with the finished product, its dairymen customers have been asked to make cheese of their product until market conditions are relieved.

CATTLE AND SHEEP.

W. C. Dallas of Merced recently shipped two cars of calves to the San Francisco market.

According to a report, Miller & Lux are scouring the State for feeder stock for the coming winter.

Two blooded Durham bulls were recently purchased in Petaluma by E. H. Smith of Mendocino county, to improve his stock.

The J. R. Garnett and Butte ranches of Glenn county are reported to have been leased by a cattle and sheep syndicate.

Five hundred and eighty head of beef cattle were recently sold by John Bryan of Monterey county to a San Francisco butcher.

It is stated that steer hides bring 25 cents a pound in Boston at the present time, which is a higher price than they have ever commanded.

It is reported that all the long wool in the Ukiah section of Mendocino county, with the exception of one lot which the grower is holding for 30 cents a pound, was sold to the New Jersey Spinning Mills of New Jersey for 27½ cents per pound.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

DAIRY CATTLE.

INCREASE QUANTITY AND IMPROVE QUALITY of your milk by using a Guernsey Sire. We can furnish choice imported or home-bred bulls from big record cows at attractive prices. **Imp. Itchen May King 25174**, the best living May Rose bull, heads the herd. See him and his calves at San Francisco Exposition. We offer the usual number (about 100) choice
Shropshire Yearling Bucks
for sale. They are equal to the best and the price is reasonable. Call or write to R. E. DRESSER, YOLO, CAL., or EDGAR J. DE PUE, 818 Merchants' Ex., S. F.

Calf Profits
Are you getting them? Calf profits mean more to you now than ever before.
Blatchford's Calf Meal
has been known since the year 1880 as the complete milk substitute. Costs less than half as much as milk — prevents scouring — promotes early maturity. Sold by dealers or direct from the makers.
Write for New Data See actual figures showing you how to increase your calf profits.
F. F. SMITH & CO. - Sacramento, Cal.

The American Sheep Breeder predicts a great demand for Merino wool during the next five years, in consequence of a possible shortage in the world's fine wool clip.

Ten thousand head of sheep were recently shipped to Stockton by a breeder at Klamath Falls, Ore., to be put on stubble lands during the late summer and winter months.

The entire herd of Herefords owned by J. W. VanNatta have been purchased by J. Crouch & Son of Lafayette, Ind., well known breeders of Percheron and Belgian horses.

Sonoma and Mendocino county sheep growers met at Cloverdale on August 24 with Dr. Chas. Keane, State Veterinarian, for the purpose of discussing means of eradicating the scabbies which is seriously infesting their flocks.

HORSES AND SWINE.

At least 300,000 horses will be taken out of this country for war purposes by England, France, and Germany.

Five carloads of hogs were recently shipped to San Francisco by Hammond & Ryan, live stock buyers of Lemoore.

A car of mules were recently

(Continued on page 211)

COMING SALES.

In a letter to this paper from J. W. McAlister, Jr., sales manager of the California Holstein Breeders' consignment sale to be held at Hanford October 14 and 15, he says: "Among the stock to be sold that is of particular interest is the entire herd of C. C. Lester of Gilroy, who will offer 60 head of exceptionally fine animals and perhaps the finest bunch that has ever been consigned to an auction sale in the United States. There will be Wisconsin Daisy of Sleepy Hollow who made 29.91 pounds of butter from 619.4 pounds of milk in seven days at the age of four years and six months. She made over 102 pounds of milk in 24 hours the last day she was on test and would have made over 32 pounds of butter had her test not been unfortunately discontinued by mistake. She is sired by Anselmo, who is one of the greatest bulls of the breed considering his opportunity, his daughters averaging 21.69 pounds butter for seven days, which is only equaled by three or four other sires. Two other daughters of this bull will be sold, including Colantha of Sleepy Hollow 2nd, who made 24.42 pounds of butter as a senior three-year-old, and Cantate Pietertje of Sleepy Hollow who made 26.47 pounds as a junior four-year old. Two daughters out of this 29.90 four-year-old, a daughter of the 24.42 pound three-year-old and a daughter of a 24.45 pounds daughter of Anselmo, will make a total of seven head of this family to be sold. Mercedes Korndyke De Kol Johanna who has a record of 25.50 pounds, Molly De Kol Glasgow who made 29.58 pounds as a junior four-year-old and Vogelschem of Sleepy Hollow with 18.56 pounds will also be sold. Among the heifers are 15 granddaughters of Colantha Johanna Lad, the sire of large milk producers and sired by his best bred son, Colantha Sir Pontiac Aaggie. His dam is a high record daughter of Aaggie Cornucopia Pauline, the world's former champion butter cow with a record of 34 pounds as a four-year-old. Many of these heifers are out of cows with records of from 22 to over 30 pounds of butter in seven days and they will be in calf to two of the best bred bulls in the United States.

During the past week T. J. Gilkerson of Lemoore paid this office a visit in connection with the double dispersion sale on the Kings County Fair Grounds at Hanford on September 15, which he is holding in connection with Dr. Weldon of Sacramento. He states that he expects this to be a great sale as they have about 100 head of excellent cattle to offer and that he considers his bull, Julianna De Kol King Segis, the greatest bull that has ever been offered at public auction on the Pacific Coast. This bull combines great type with his breeding, having won first prize as a senior yearling at the State Fair in 1914, and with his breeding should prove a great transmitter, being a half brother on his dam's side to Juliana King of Riverside, who has sired many of the high annual record cows in the Morris herd. He states that he now has a tester doing official work at his farm near Stratford, and that 15 half sisters to the $1000 heifer of last year's consignment sale will be sold. About 30 of his females are with calf to the herd sire, Julianna De Kol King Segis. Mr. Gilkerson has devoted ten years to the developing of a high class herd, and he states that his reason for offering them at public auction at this time is due to the fact that conditions make it advisable for him to devote his energies to other interests and that rather than allow his herd to be handled under others' supervision, he prefers to dispose of them entirely and give other breeders the opportunity of securing this blood where they will be developed and aid in developing the breed. These, with the addition of the Heenan & Weldon herd, will make a very desirable selection for old and young breeders alike, and will doubtless be appreciated by the admirers of the "Black and White" in this State.

JULIANA DE KOL KING SEGIS, Herd Sire Of Stratford Dairy Farm To Be Sold At the Double Dispersion Sale, Hanford, September 15.

There is a Difference

BETWEEN THE

Ideal Green Feed Silo

AND

OTHER SILOS

IT DOESN'T TAKE AN EXPERT to tell the difference between an **Ideal Green Feed Silo** and some others.

ON THE CONTRARY, it is an easy matter if the prospective purchaser will remember that a silo to be of any value whatever must be "air and water-tight" and capable of producing good ensilage from every pound of good feed put into it.

IF HE WILL THEN TAKE FIVE MINUTES to compare:

The detail of construction,
The quality of material and workmanship,
The contact of the doors with the door frame,
The kind and size of hoops and lugs used,
The quality of the paint for the inside,
The type of roof and whether or not it is fitted with a galvanized ventilator,
What provision, if any, is made for keeping the silo round and preventing its collapsing,
In fact, everything that enters into the design and construction of a silo that will make it a thoroughly practical piece of equipment,

He will then see the difference.

THE MAN WHO TAKES even the first step indicated in seeing for himself the difference between the **Ideal Green Feed Silo** and others does not put his money into any other, one time in a thousand.

THE COMPARATIVELY FEW BUYERS of other silos are those who merely read printed claims, or listen to the argument of some self-styled "advisor" who is probably working for a commission only and whose sole purpose is primarily to sell a bill of lumber.

THE WISE BUYER OF A SILO today does see the difference when buying his first silo, while the unwise or careless one usually finds that his presumed saving in first cost actually means a loss to him in spoiled feed and **represents the difference between success and failure in the use of a silo.**

OUR PURPOSE in selling a silo is to develop the dairy and stock raising industry on a more substantial basis than heretofore, and in order to do this we must supply a silo that is a thoroughly practical piece of equipment.

THAT IS THE REASON WHY four buyers out of five are buying **Ideal Green Feed Silos** and why the use of the **Ideal Green Feed Silo** will, before long, be as nearly universal on the Pacific Coast ranch as it is in the Eastern States and Canada.

Veterinary Queries and Replies.

[Answered by Dr. H. B. W Intringham, Petaluma, Cal.]

MAY BE TUBERCULOSIS.

To the Editor: I have a cow with a big, spongy lump on each side of the jaw; cannot eat well, and is getting poor. Kindly let me know what you think should be done, and if it is contagious.—C. G.,Fairmead.

[Have this cow tested for tuberculosis. If she does not react it will be time enough to treat for some other trouble.]

CAKED BAG.

To the Editor: My cow has a caked bag after calving. She is 9 years old and calf is 12 days old. The front quarter on left side remains hard down into the teat and refuses to move. No lumps, no blood, does not seem sore. Calf is still sucking. I bathe the bag with warm water.. She is a very heavy milker, giving 12 quarts of milk daily at time when dried.—Mrs. C. D., Grass Valley.

[Rub this quarter well twice a day with hot camphorated oil. Give internally the following:—red iodide or mercury, 90 grains, potassium iodide 60 grains, simple syrup, one pt. Dose: one tablespoonful twice a day.]

SPAYING SCRUBS.

To the Editor: Will you please tell me what you know about spaying cattle? Does it set them back much? When should it be done, as calves or yearlings? Isn't it a common practice in the East? I have been told that it stunted a calf to spay it, but hardly understood the reason. It seems to me with a bunch of mixed cattle, if one spays his scrubs, he will be able to breed up much faster. Any information you may have will be gratefully received. —G. W. M., Dixon.

[You most certainly have the right idea about building up by spaying the scrubs. Instead of making scrubs of these animals, it has just the opposite effect and they make much better gains and better beef. It has been a common practice until recent years, but the high price of beef has stopped the practice, as every cow that would bring a calf has been in great demand. The best time to do this is when the weather is cool and the flies are scarce. When properly done, all effects of the operation will disappear within two weeks. The best age to spay is at one year. The use of a first-class bull and selection will, however, produce remarkable results in the course of a few years if carefully carried out.]

COW TROUBLES.

To the Editor: My cows are very loose in their bowels—some worse than others. They have alfalfa hay to eat, fed from the stack, plenty of clean water and shade from the hot sun. They eat well and have not lost any on the flow of milk, but I do not think it good for them to be so very loose so long; it has been nearly a month. Is cotton-seed meal good for them? Does it increase the milk flow, and is it beneficial in any other way? When they are rough instead of smooth, the hair looking like it had been brushed the wrong way, should they have a tonic or some different feed?—Mrs. F. J. C.—Dos Palos.

[You are probably feeding too much alfalfa and I would advise that you provide enough grain to make up one-third of their ration.

Cotton-seed meal is a concentrate, the same as grain or millfeed; it helps to increase milk flow and butter fat content by supplying the needed elements in an easily assimilable form. It should not be fed, however, except in small quantities and very gradually.

When they look rough it would be better to feed more concentrates rather than to resort to drugs.]

COWS DOING POORLY.

To the Editor: I have two Holstein cows that act very odd. They eat and drink very little and are very poor; lie down most all day. When they get up they are stiff on the hind part of their body. They give hardly any milk, dry up, and drag their hind feet when walking. If they happen to get to a little higher spot they almost fall. Please advise me what to do for them.—F. P., Orland.

[Give these cows each two pounds of epsom salts dissolved in just enough water to make a solution. Follow this up by giving 2 drachms of potassium iodide in water three times a day on an empty stomach.]

ANGORA GOATS.

To the Editor: Can you give information regarding Angora goats; viz., will they do well pasturing on logged-off land, where there is a second growth of fir, spruce, etc., from three inches to twelve inches in diameter, undergrowth of brush, wild blackberry and currant bushes, also weeds, and some places good growth of grass, rainfall averaging 17 inches, falling between September 1 and April 1, with an occasional shower balance of year, and occasionally small amount of snow? What is the average price of the hair and pounds per head, also height of fence required to keep them in.—M. W. R., Seattle, Wash.

[Answered by F. W. Woll, University Farm, Davis, Cal.]

[Angora goats are often used for clearing land and keeping fire breaks and rights-of-way, etc., free from underbrush. They would prove valuable under conditions similar to those stated in the letter. The price of mohair has increased greatly of late years. In 1908 it ranged from 22c to 25c per pound, while in 1913 it averaged 34c per pound. The average weight of the fleece of American Angoras is about two and a half pounds, according to Farmers' Bulletin 573, "The Angora Goat." This publication can very likely be obtained on application to the Secretary of Agriculture, Washington, D. C. It gives excellent brief discussions of Angoras and of questions relating to the management of the flock.]

WHEN COWS SHOULD FRESHEN.

To the Edltor: About a half-dozen of my cows came fresh last March and April. It is best to breed them now, or wait until December, which will bring them fresh again, a year from next fall, when butterfat is on the rise in price? It seems a long time to let cows wait, and I wonder if it will not make the cows dry for too long a perlod to be profitable. If they are bred now, however, they will come fresh in the summer, when butterfat is low and the heat lowers their production.—C. L.,Waukena.

[Answered by J. M. Bomberger, Modesto.]

[I think you would find it more profitable to change the freshening time of your cows more gradually, having them come fresh a month or two later each year. By making the change all at once, you may have trouble in getting the cows with calf after the long wait, besides having them dry, or nearly so, for a long time.]

BEWARE OF POORLY MADE HORSE COLLARS

More shoulders are being ruined by poorly-constructed collars than by the work the animals are doing.

W. DAVIS & SONS'

FELTFACE COLLARS are guaranteed to prevent sore shoulders.

Look for the felt at the edge of the stitching.

Made to sell as follows:

FELTFACE, medium draft, $5.00
FELTFACE, heavy draft .. 6.00

If your dealer does not have them, we will tell you where they are to be had, or send direct if no dealer is within reach.

Our CUSHION COLLAR, a canvas and leather Boston Team Collar, is now to be had for $3.00.

ANOTHER GOOD SORE-SHOULDER PREVENTER

A selling agent (dealer) in nearly every town. If none in your town, Write Us. Catalogue on application.

Breeders of

Short Horn Cattle
Shropshire and Merino Sheep

ATTENTION, SHEEPMEN.

My pure-bred, range-raised yearling Shropshire and Merino rams are now out of the mountains and ready for inspection at my place.

Shropshires sired by rams imported by me from England in 1911.

From One to One Hundred Hogs.

To the Editor: I contemplate engaging in the hog-raising business as a specialty in Northwestern California or Oregon. I would have ten or fifteen acres moist bottom land on which to raise clover or alfalfa, besides roots and kale, etc. Would either cut green feed for the hogs or else pasture them a short time in different fields so as not to cause too much injury? Would buy millfeeds such as middlings, bran, or rolled barley to feed as a warm slop. Have had excellent results feeding one scrub hog at a time, as above, with the addition of a few table scraps, feeding slop three times a day and green stuff between times; but is the plan practical on a larger scale as a specialty? Have averaged 70 to 100 per cent profit on retail cost of purchased feed. Could I expect to do as well with, say, 100 head of all sizes, and is that sufficient returns to cover all expenses and leave a profit? I expect to keep a purebred boar and to start with grade sows. Can you tell me what millfeeds have been found best? Would also keep two or three Holstein cows so as to have some skim milk. Can you recommend a good book on breeding, in simple language, so that I can breed up and maintain good market hogs? —B. B., Dyerville.

[Answered by Chas. Goodman, Williams.]

[If you have realized a profit of from 70 to 100 per cent on the retail price of feed, it seems that you are not slow as an amateur feeder. This would make a veteran sit up and take notice. However, you cannot expect as good results in feeding 100 head as one.

Your method of feeding is excellent, and would be hard to improve on. Rolled barley, middlings, and bran is as good millfeed as one could desire. But if the hogs were running on alfalfa, we would cut out the bran, as alfalfa and bran are both very high in protein, which would doubtless throw your ration out of balance.

We would not start with a purebred boar and grade sows. We would have at least one or two sows of the same breed as the boar and gradually work out of the grades. It will pay in the end.

The best book we have seen written in plain English is "Forty Years' Experience of a Practical Hog Man," by A. J. Lonejoy of Roscoe, Illinois. You can obtain this book only from the Frost Publishing Co., Dearborn St., Chicago. You will also receive a year's subscription to the Berkshire World for the dollar. The Rural Press will shortly publish a swine book that will doubtless meet the requirements of Pacific Coast people better than anything yet published.]

FRUIT FOR HOGS.

To the Editor: At present prices for grains considered for hog feeding, what is the value of fresh peaches, dried peaches, and raisins for hogs? Can you give us the amount of proteins and other animal foods elements in each?—R. E. H., San Francisco, Cal.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

[Fresh peaches contain 15 to 20 per cent of dry matter (80 to 85 per cent of water), and dried peaches about 25 per cent of water, 2.1 per cent digestible protein, and 68.1 per cent of digestible carbohydrates and fat. The corresponding figures for raisins are 19 per cent water, 3.4 per cent digestible protein, and 65.2 per cent digestible carbohydrates and fat. On the basis of the amounts of digestible components in different fruits and in concentrates, we may assume, with Professor Jaffa, that 100 pounds of dry peaches have a similar feeding value as a 85 or 90 pounds of barley, that the feeding value of fresh peaches is equivalent to one-third this amount, and that raisins and barley may be considered of about similar value, ton for ton, for feeding farm animals.

Barley is worth $26 per ton at the present time, and wheat middlings about $36, at which prices the latter feed is more or less of a luxury and should be used in small amounts only, if at all, for the sake of introducing variety in the rations fed. The approximate cash value of peaches and raisins for hog feeding may be readily determined from the relative feeding values given above.]

TOMATOES FOR HOGS.

To the Editor: Is there any food value in tomatoes? If any, how much? Do they make good hog feed? —C. E., Elk Grove.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

[Tomatoes are doubtless fed occasally to hogs, but I know of no case where they have been fed in large amounts or for a considerable period of time. They contain about 95 per cent of water, or only one-half as much solid materials as skim milk or buttermilk. The dry matter of tomatoes consists largely of different kinds of sugar, with some protein substances, organic acids (mainly citric acid), and mineral matter. On account of the great dilution in which these feed materials occur in tomatoes, and their relatively high acidity content of these, they should only be fed sparingly, along with dry roughage and grain. Fed under such conditions, there is every reason to believe that they will prove valuable for feeding hogs and will add to the palatability and nutritive effects of the rations.]

M'ALISTER & SON, Chino, Cal.

175 HIGH CLASS REGISTERED HOLSTEIN FRIESIAN CATTLE
Tuberculin Tested.
State Fair Grounds, Sacramento, California,
October 6th and 7th

Never before in any sale in the world have such wonderful individuals of size, growth and conformation been offered to the public. Look as this list of offerings strictly from a standpoint of individuality!

KING SEGIS PONTIAC EMPEROR—not alone the greatest bred bull but one of the greatest individuals ever offered at public sale, having three times won 1st prize at the State Fair, including two Grand Championships; also ten of his best daughters, one of whom has won first prize for three consecutive years.

LORENA KORNDYKE—one of the World's greatest show bulls, having won for four consecutive years at the State Fair, including two Grand Championships; also ten of his daughters, several of whom have been prize-winners in the show ring.

Twenty daughters of **KING PONTIAC TOPSY,** one of the best sons of the King of the Pontiacs, that average in weight at 12 months of age, 895 lbs. and are superb individuals.

Five daughters of **DE KOL HENGERVELD BURKE**—a bull of wonderful constitution and conformation.

Four daughters of **KING KASTELEINTJE SEGIS,** whose six nearest sires and dams have all been first prize winners.

Other cows and helfers of individuality, size and conformation never equaled in any other sale anywhere.

BRED TO BULLS OF SURPASSING EXCELLENCE!

Including sons of **TILLY ALCARTRA, RIVERSIDE SADIE DE KOL BURKE, ARALIA DE KOL,** cows with not only World's Records, but of unsurpassed individuality, whose sons have inherited their strong qualities. Also a son of the greatest show cow the West has ever known, **DE KOL OF VALLEY MEAD,** and one of the best sons of the King of the Pontiacs and a prize-winner at the State Fair.

BULLS GOOD ENOUGH TO BREED TO THESE FEMALES! A strong statement but a true one! Included in the list of bulls are not only the great sire **KING SEGIS PONTIAC EMPEROR** and **LORENA KORNDYKE,** but also a son of De Kol of Valley Mead 2nd, a world's record cow and a first-prize winner. A son of the 1000 lb. butter cow, Miss Blaney, and a show bull in every respect. A son of a 31-lb. 4-year-old and other sons of great yearly record cows, sired by sons of World's Champions. And these are not all! About 20 more nice ones.

COL. BEN A. RHOADES, Los Angeles, Calif. Auctioneer.

The California Holstein Breeders Second Consignment Sale
175 REGISTERED HOLSTEINS 175
Tuberculin Tested
HANFORD, CALIF.
October 14th and 15th

DO YOU WANT PROOF? HERE IT IS.

About 25 A. R. O. cows with records as high as 29.90 lbs., made as a 4-year-old, including a cow with a 3-year-old record of 24.45 lbs. and others over 20 lbs.

About 30 daughters of great record cows, including a daughter of a 30-lb. cow, 2 daughters of the cow with the 29-lb. 4-year-old record. Daughters of the cow with the 24-lb. 3-year-old, daughter of a 24-lb. 4-year-old, 3 daughters of a 22.50 lb. cow and others from large record dams.

DAUGHTERS AND GRANDDAUGHTERS OF GREAT SIRES!—Including 15 daughters of **COLANTHA SIR PONTIAC AAGGIE,** the greatest bred son of **COLANTHA JOHANNA LAD,** nearly all from large record cows with records as high as 30 lbs. and daughters and granddaughters of such great sires as King of the Pontiacs, Pontiac Hengerveld Parthenia, Homestead Girl De Kol Sarcastic Lad, Sarcastic Lad, Juliana King of Riverside and others of equal note.

BRED TO SONS AND MOTHERS OF WORLD'S CHAMPIONS!

What will the calves of such great cows and sired by such bulls as Tilly Alcartha Son, Arcady Pontiac Wayne Hengerveld, Judge Hengerveld De Kol, both brothers of World's Champions, Prince Juliana De Kol Walker, son of former world's record heifer, Dechter Spofford Korndyke Lad, son of a 36-lb. cow, and King Segis Pontiac Emperor 3rd, out of a cow with a butter record of 870 lbs., be worth? Can you ever estimate their value?

A GREAT LOT OF BULLS! Including King Segis Pontiac Emperor 3rd, Sir Holland Gant, one of the greatest show bulls in the West. A son of a cow with a record of 772 lbs. butter in a year, a son of King Pontiac Topsy, out of a 28-lb. daughter of the $25,000 sire Johanna McKinley Segis, a son of a 28-lb. 4-year-old, sired by King Segis Pontiac Emperor 3rd, and others worthy to head your herd.

JAMES W. McALISTER, JR., Chino, Cal., Sales Manager. **COL. BEN A. RHOADES, Los Angeles, Cal. Auctioneer.**

TERMS: $500 and under, cash; over $500, one-third cash, balance in 3, 6 and 9 months with bankable note and 8% interest. 3% discount allowed for cash on time sums. Buyers from a distance must bring satisfactory bank references.

NOTE—Foot and mouth disease has again broken out in the East and Middle West. Your only opportunity to secure high-class Holsteins at your own price for many months will be at these two sales.

Catalogs ready about Sept. 10.. Write for one.

Ration Balanced for Egg Production.

[Written for Pacific Rural Press by Geo. H. Croley, President Federated Poultry Ass'n. of California.]

In the preceding issue we stated that in order to make laying hens pay a profit, it is necesary to feed them a ration balanced for egg production; we mentioned that at the Missouri Experimental Poultry Farm, it was discovered that one pound of digestible protein would produce 16⅔ whites and one pound of carbohydrates would produce 3⅓ yolks. We have carefully tabulated the digestible value of a number of California feeds that may be obtained in practically all parts of the State and give below a ration balanced for egg production on the basis of the Missouri scale.

			Whites	Yolks
100 lbs.	Mixed Wheat	make	147	237
70 "	Whole Barley	"	98	161
50 "	Whole Oats	"	73	98
50 "	Cracked Corn	"	65	111
100 "	Egyptian Corn	"	77	154
50 "	Kaffir Corn	"	43	79
50 "	Milo Maize	"	41	79

500 "	Fresh Growing Corn Stalks	"	99	211
500 "	Fresh Green Alfalfa (or 150 lbs. cut alfalfa hay or meal)	"	296	215
250 "	Oat Hay Cut in the Milk	"	197	337
250 "	Mangels	"	41	53
250 "	Pumpkins	"	42	55
2500 lbs.	Green Stuffs, containing about 85% water, equals about 500 lbs. dry feed		959	1130
	Summary.			
500 lbs.	Assorted Grains	make	590	975
540 "	Mash	"	1439	882
2500 "	Assorted Green Stuff, etc	"	959	1130
			2988	2987

In regard to the green stuff, etc., it is not necessary to feed this assortment constantly, but the list is grouped so that a good general idea of the feed values may be obtained. In the winter and early spring, cabbage, rape, and mixed grasses, etc., could be used; in summer, growing corn and alfalfa; and in the fall, cut oat hay with mangels and pumpkins or any assortment may be used that does not seriously throw the ration out of balance.

If any readers wish to ask further information in regard to this matter we will be glad to answer through these columns.

Hatch Chicks This Fall.

[Written for Pacific Rural Press by Geo. H. Croley.]

Apparently a very large number of California poultry keepers consider the fall hatching of chicks as a recently devised experiment that may or may not be practical. As a means of dispelling this false notion, we publish the following letter from T. R. Jacobs, one of the earliest of pioneers in poultry culture in California. Mr. Jacobs says: "This is an age of advancement, and the old fogyism of the past must be cast aside, to-wit: spring is the natural time for the hatching and rearing of chicks. When you create a new hatching period, you create a new laying period; the laws of nature remain the same and are not affected. It is only a matter of change in time. In drawing a comparison of fall and spring hatching: If a person will stop to think, he will very readily see the advantages of fall hatching. The fall hatched chick has the benefit of climatic conditions with cool weather which is inducive to scratch and work, developing muscle, making a fast growth, and larger frame. They have the benefit of the first rains that moisten the ground, bringing forth the grubs and worms which are necessary for their growth and development. Fall hatches give stronger fertility and less mortality. The male bird kept apart till wanted to use for fall eggs will be just as strong and active (if not more so) than in the spring. Having constructed the first incubator that was built in California 45 years ago, and with it hatching chicks every day in the week at the County Fair in Sonoma County held in September, I can enthusiastically endorse the fall hatching of chicks. I hatched 94 per cent of the fertile eggs and I never saw a stronger and more robust chick than those hatched at that time. Brother Poultrymen, try fall hatching and you will be convinced. Brother Croley, keep up the good work."

J. F. Ricketts of Fair Oaks thinks from his experience, that the following is a satisfactory prevention of crown gall: At planting the roots are soaked in a puddle containing mud, wood ashes, and blue stone. Trees planted several years ago after such treatment are still sound while others around them are affected.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

CAN THE MOLT BE CONTROLLED?

One of our subscribers writes to ask where he can get a book that will tell him how he can control the molt, and time of hatching, etc., saying he has mastered the A B C of poultry culture himself, but needs book learning along these points.

Now, I am not egotistic enough to think that I know it all, but do think that in "California Poultry Practice" can be found more "real" information regarding the molt in California than in any of the eastern books, some of which are written by men who would not know chicken from rabbit, even when it's put on their dinner plate.

Natural Molt.—A hen may go through a natural molt, or say a flock, when they are left strictly alone to forage their own living. They commence from August to December and get ready to lay about March. Any interference in the way of serving rations to help them along with the quick disposal of the old crop of feathers and putting on the new, may be termed "controlling the molt."

The fact that changing the food, moving chickens around, and a dozen other little things will sometimes start the molt is proof that nobody can lay claim to positive knowledge, or give positive information. Keeping hens on light rations of narrow ratio will start the molt, then it is up to the feeder to control the time it may last; he can feed so that the molt will be almost natural, or he can hurry matters up to suit himself, if his hens are healthy.

All poultrymen agree that conditions in California are quite different, owing perhaps to climatic conditions, than in the East. This being a fact, what good will it do any Californian to crowd himself with eastern lore about the molt?

Now, any method of feeding, caring for, and assisting this natural molt both in shortening the period and making it come at the best season for the fowls and their owner has been termed "controlling the molt." The late James Shackleton was the first man I know anything about who started the method of "forcing the molt." So we see that really everybody who feeds their poultry and gives them good care are controlling the molt. And still such a little thing will start it, and other things prolong it, that it is important for us to learn all we possibly can about it.

How to Control Molt.—The things most essential are the perfect health of the fowls, freedom from dirt and damp, and absence of lice. With these assets as a base to work on anyone can get hens through the molt in sixty days, provided they will supply the hens with material to work with. The Egyptians could not make bricks without straw, and hens cannot make feathers without mineral matter, for that is chiefly what feathers are composed of. So while the feed should be nutritive, it can be narrowed down to a low ratio composed of very little else but mineral and protein with very little carbohydrates.

What to Feed.—A mash containing beef scrap or meat meal 10 per cent and supplemented with green bone ½ ounce to a hen if it can be got, if not, any kind of good ground bone kept before the hens all the time. The mash should be mostly ground barley, oats, and shorts, not a great deal of bran, and oats for one meal a day, with plenty of green feed, grit, shell, and good fresh water. The less carbohydrates and fibre the hens are made to digest, the better they will use the mineral matter for feathers. In cold weather, they would naturally need more carbohydrates to keep up their fat and flesh and hold up bodily heat, but in summer they are hot enough without heat-producing feed.

How soon they can be got to laying will depend first on the health and condition of the hens and the amount of feed of the right kind being supplied. Hens that molt very early as these have done are liable to have another molt about December or January, but it will only be a partial molt and if extra mineral feed is supplied time enough the hens will not stop laying altogether; or if they do, it will be for a very short time. There is no way of preventing this partial molt. Nature seems to call a halt about that time and the only thing we can do is to keep the feeding and conditions of the fowls as regular and even as possible.

WITH THE LIVESTOCK MEN.

(Continued from page 207)

shipped by J. T. Ragsdale of Merced, to San Francisco, where they will be reshipped to Honolulu.

Beginning August 20, the Golden Gate Thoroughbred Breeding Association will put on 25 days of horse races at the Panama-Pacific Exposition grounds.

A consignment of registered Poland-China shoates were recently purchased from the Kansas State Agricultural College by Chas. Gatewood & Sons of Rolinda.

A report from East St. Louis, Ill., states that a representative of the Italian government is in that vicinity for the purpose of securing 12,000 horses for war uses.

Twenty-three head of mules were recently shipped from Merced to Roseville by W. G. Harris, who is purchasing these animals for the English and French armies.

Six prize saddle horses, a recent importation from Kentucky, were shipped by H. B. Thornberry of Stockton to the Panama-Pacific Exposition to be exhibited until November.

K. G. Chapman of Hartsville, S. C., purchased from the Winona Ranch at Grants Pass, Ore., the first purebred pig ever shipped by a Pacific Coast breeder to the South Atlantic states.

J. M. Bomberger of Modesto recently shipped to Wm. K. Notley of Pacivilo, Hamakua, Hawaiian Islands, two sows and one Berkshire boar. He also shipped to N. W. Kaufman, Crows Landing, a six-months-old boar pig that weighed 230 pounds net.

The Empire Rabbitry of Empire, Cal., have between two and three thousand fine animals. They report the sale of $2478 worth of rabbits between June 20, 1914, and June 20, 1915, besides numerous sales since the latter date.

THINGS TO FORGET.

If you see a big fellow ahead of the crowd,
A leader of men, marching fearless and proud,
And you know of a tale whose telling aloud
Would cause his proud head to in anguish be bowed,
It's a pretty good plan to forget it.

If you know of a skeleton hidden away
In a closet and guarded and kept from the day,
In the dark; and whose showing, whose sudden display
Would cause grief and sorrow and lifelong dismay,
It's a pretty good plan to forget it.

If you know of a spot in the life of a friend
(We all have such spots concealed world without end),
Whose touching his heart-strings would play on and rend,
Till the shame of its showing no grieving would mend,
It's a pretty good plan to forget it.

If you know of a thing that would darken the joy
Of a man or a woman, a girl or a boy,
That will wipe out a smile, or the least way annoy
A fellow, or cause any gladness to cloy,
It's a pretty good plan to forget it.

If you know of a thing, just the least little thing,
Whose telling would cork up the laugh or the grin
Of the man you don't like; for the Lord's sake keep it in.
Don't, don't be a knocker; right here stick a pin,
It's a pretty good plan to forget it.
—J. M. Lewis, in Pioneer.

TWO LITTLE SHOES.

Two little shoes were standing on the shelf in the shoe shop. They were very shiny, their lacings were uncrumpled, they were new shoes, they were boys' shoes!

They could look out of the window into the busy street. They could look down into the busy shop. They could see everything, yet the little shoes were not happy.

"I wonder why I feel so queer?" said the little shoes to a pair of men's shoes at his side. "Big shoes, tell me why? You are so much wiser than I am."

"But how do you feel, little friend?" said the big shoes, kindly.

"Oh,—empty, hungry," replied the little shoes in a very forlorn way.

"That is because you have no small, dancing feet laced up inside you. But do not lose heart. Some day your boy will come. He will run up and down all day long, and then you'll not be lonely, then you'll not feel hungry."

"Will he come today?" cried the little shoes, eagerly.

"No one knows. Just wait and see." So each day the little shoes waited hopefully. At last a sunny spring morning came and with it a pretty lady. Now the lady held by the hand a little boy who could not keep still one minute. He had bright goldy locks that went bibbety-bob. His cheeks were like two pink roses, and his mouth was made to kiss.

Little boy ran up and down the shop. He chased the solemn old dog from his warm corner by the fire. He tried to climb up on the backs of the chairs. At last the shop man caught hold of him and swung him up on the cushioned bench.

"Hi! Mister," he said. "When a fellow wants a pair of new shoes, he has to keep still just a minute."

The little shoes almost trembled when they saw the man come his way. Was that his boy? Was he really to be chosen at last?

The shop man reached up and took down the little shoes. "Here's just what you want, ma'am," he said. So the old shoes were taken off and the new ones slipped on. Oh, how warm and pleasant it was to feel those fat toes cuddling away inside! The shoes no longer felt empty and hungry.

"How do they feel, Bunny?" said the pretty lady, after the shoes had been laced.

"Just yovely," said the little boy. "Can't I wear 'em home, Mother?"

"Are you sure they are all right?" said Mother, doubtfully.

Little boy slid down from the seat and ran skipping to the other end of the shop, every yellow curl bobbing. "They're just yovely." he cried.

So the old shoes were left to be mended, and they all started for home.

"Good-bye, kind, big shoes!" cried the little shoes. "Good-bye, little friend," said the big shoes. "I'm glad your boy has come."

So the plump feet in the new shoes danced home. They went up and down and around the house and yard until bedtime, and then both shoes and boy were tired out.

The little shoes felt lonely and sad when the boys feet were taken out of them. They wondered if that was the end of all good things. But another day came, with its sunshine and the boy's sweet laugh.

"You must not go out of the yard, Bunny," said Mother.

"No, Mother, I'll not," promised little boy, dutifully. For a long time all went well, then the boy stood by the gate and peeped out.

"Oh, dear!" thought the little shoes. Boy opened the gate and at the same time looked up at the windows: no one was watching.

Then one foot slipped outside. "No! no!" cried the shoes. But the boy did not listen, and out went the other foot.

"Don't! don't! please don't," implored the little shoes. "Mother said, 'No! No!'" But still the boy did not listen. The feet began to run and the shoes had to run, too.

They went down to the river, and little boy picked up pebbles and threw them into the water. It was such fun, and he threw harder and harder. Suddenly his foot slipped, and over went boy and the new shoes into the water!

A man heard boy scream and pulled him out. He was not hurt, but, oh, so wet. The man was a kind man and carried him home. Mother was just coming out of the gate when they reached there.

"Oh, Bunny!" said Mother, sadly, when she had heard the man's story and thanked him.

"I couldn't help it! The shoes made me go! I didn't want to. I tried not to, but they just made me!"

"The new shoes?"

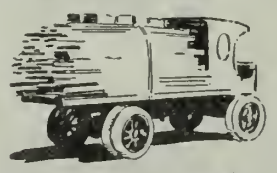
"Yes, Mother."

"Then they were very naughty! I think we must hang them." Oh, how unhappy the shoes were. Boy, his boy, had not been true to him!

Boy was stripped and popped into a warm bath. Then he was rubbed, rolled up in a blanket, and put to bed. Then mother took the shoes and hung them over the fire.

Sad, indeed, were the little shoes. The water rolled down their lacings and fell in drops to the floor. It truly looked as if the shoes were crying. Boy watched the drops with a strange, heavy feeling in his heart.

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG!
1915 Edition is FREE to you—Saves 20% to 40%



$15 to $18 Front Doors $10 Veneered Oak with Plate Glass
—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

Screen Doors 25% Off
—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

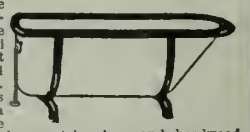
Style No. 8, $1.25
—This door usually sells for $1.65. Made of clear sugar pine and fitted with black screen wire, like picture, at our price..... $1.25

Style No. 9, $1.40
—Made of sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand lots of use; our price..... $1.40

Odd Doors $1 and $1.25
—Inside doors of best sugar pine, 5 panel Colonial and 5 panel O. G., varies a big lot of them, in all sizes.

Oregon Pine $10 to $15
—Good new rough Oregon Pine lumber, all sizes, at $10 to $15 per thousand.
—Oregon Pine lath, 4 ft., new, $2.50 per thousand.
—Best grade Slashed Grain Oregon Pine, sanded finish, $37.50 per thousand. This makes a beautiful interior finish.
—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

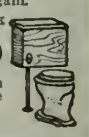
Paints $1.50 Gal.
—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities an dsell for the lowest prices.
—Standard House and Floor Paints, $1.50 per gal.
—Standard makes of varnishes at 25% off regular prices.
Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.
Dutch Kalsomine 4½c per lb.
Black Graphite Roof —per gal..... 50c
Standard Roof Paints—red, green, gray—per gal..... 85c
Shingle Stain, made from pure ground colors —per gal..... 50c



"Standard" Roofing Paper
—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.
1-ply, double-sanded, per roll of 108 square feet..... $1.15
2-ply, double-sanded, per roll of 108 square feet..... $1.40
3-ply, double-sanded, per roll of 108 square feet..... $1.65
1-ply, "Klug" smooth, per roll of 108 square feet..... $1.25
2-ply, "Klug" smooth, per roll of 108 square feet..... $1.50
3-ply, "Klug" smooth, per roll of 108 square feet..... $1.75
—Send for free asmple. Remember we ship direct to you.

SHOVELS!—At Wholesale Cost—SHOVELS!
—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.
—Every one in perfect working condition, all styles and sizes; note the prices:
Long Handle, Round Point Shovels, per doz. $4.85 or 50c each
Long Handle, Square Point Shovels, per doz. $4.85 or 50c each
D Handle, Round Point Shovels, per doz.....$4.15 or 50c each
D Handle, Square Point Shovels, per doz.....$4.15 or 50c each
Long Handle Spades, per dozen.....$3.75 or 40c each
D Handle Spades, per dozen.....$3.75 or 40c each
Long Handle Scoops, per dozen.....$3.75 or 40c each
D Handle Scoops, per dozen.....$3.50 or 40c each

Dana Freezers at Half
—A big lot of Dana freezers. Send in your order today. We've sold hundreds of them at these prices and have yet to hear a single complaint.
3-quart size, regular $2.25, now..... $1.00
4-quart size, regular $2.50, now..... $1.25



$30 Wallboard for $19
—The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.
—Cheaper and neater than plaster or lumber, and anyone can install it in one-quarter of the time. Per 1000 square feet..... $19.00

This Special Steel Enameled Bath Tub $8
—One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel. Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Priced only $8.

Singer Adv. L.A.

It got bigger and bigger and boy began to cry.

"What is it, Bunny?" said his Mother.

"Don't hang my new shoes! They didn't do it! See, they're crying!"

"Who did it, then?"

"I did! I ran out of the yard! The shoes didn't make me."

"Poor little shoes," said Mother, taking them down. "Bunny is sorry. You shall not be hung any more."

Oh, how happy the shoes were as they stood on a cricket by the fire and got nicely dried. His boy had been true to him after all.

Boy went to sleep, and the yellow kitty snored before the fire, too. By and by some one rubbed the shoes with oil and made them soft once more.

The next day little boy woke up laughing, and the happy time began all over again.

HINTS FOR UNTRAINED NURSES.

Any woman can do a certain kind of nursing at a time when it is impossible to have a trained nurse, or when a trained nurse is not necessary. Some practical suggestions, called "Sick-room Dont's," are given by Mary F. Scott in a recent number of The Nurse, to make the nursing easier and better:—

Don't allow the sheets to become wrinkled.

Don't jar the bed by leaning or sitting upon it.

Don't allow stale flowers to remain in the room.

Don't appear anxious. People who are ill are very sensitive.

Don't rattle papers. Nothing gets on a patient's nerves more than this.

Don't have a carpet in the sick-room if it can be avoided; use matting instead. It may be kept clean by throwing damp tea leaves over a part of the room at a time and quietly brushing them up with a hand broom.

Don't shut out light from the sick-room when the patient is able to tolerate it. Make the sick-room the most cheerful and best ventilated room in the house.

Don't let bad air remain in the sick-room. Pure air is imperative. Avoid air from the kitchen or clothes closets. Outside air is best, but when cool, there should be a fire in the room to take off the chill.

Don't neglect screens to shade the light from the eyes of the patient.

Don't forget a nursery lamp to heat water, beef tea, etc.

Don't neglect the means to tempt an invalid's apeptite. Dainty service and delicate china will often do this.

Don't forget to vary the seasoning of food, according to the condition of the patient.

Don't give the patient toast that has not been put in the oven first and then toasted. It improves the taste and digestibility.

Don't let the patient suffer for a cooling drink when one can be given safely. This is a good way to make one: Pour one cup of bran into water and boil it an hour, strain, and add sugar and lemon juice. It is good for the patient and leaves a pleasant taste in the mouth.

Don't always bring flowers to invalids. Try daintily prepared edibles. You will be repaid when you see how pleased the sick persons will be. Nourishing broths and soups, jellies, creamed chicken, or creamed oysters in a delicately tinted bowl will bring joy to their hearts and comfort to their stomachs.

Don't open the window at the bottom only; open at the top, too.—From the New York Evening Post.

PURIFYING DRINKING WATER.

For the destruction of all dangerous bacteria which may be in water nothing equals in efficiency and convenience ordinary chloride of lime. This may be obtained from almost any grocery store in 10-cent cans and the amount required is so small as to make the cost for the entire season almost negligible. It should be used in the following manner:

One tablespoonful of the chloride of lime is dissolved in ten quarts of water. This quantity is sufficient to treat 1000 gallons of water, and the operation is carried out by simply pouring the clear solution into the water to be treated, and stirring thoroughly. This solution is a powerful germicide and its action is very rapid—ten minutes or so being all the time required to carry out the purification. One quart of this solution is sufficient to treat effectively a tank containing 100 gallons of water and one pint of it stirred into the 50-gallon water barrel filled with water will destroy any dangerous germs and make water safe for drinking purposes. The solution should be prepared fresh each time as it loses strength on standing, and the can of chloride of lime should also be kept tightly closed until needed again.

One is cautioned against the use of too much of the chemical, not because it is dangerous at all, but because an undesirable odor or taste may be imparted to the water where too large amounts are used. The strength of solution indicated above used in the manner described will be found perfectly satisfactory. The qualities of the water will in no wise be impaired and no undesirable conditions will arise from its use. On the other hand dangerous water may be made safe and much sickness prevented.

WHERE SHE SPANKED.

A little boy had eaten too much underdone pie for his Christmas supper and was soon roaring lustily.

His mother's visitor was much disturbed.

"If he was my child," she said, "he'd get a good, sound spanking."

"He deserves it," the mother admitted, "but I dont believe in spanking him on a full stomach."

"Neither do I," said the visitor, "I'd turn him over."

An amateur photographer stopped one morning at a Kansas farmhouse and inquired for the farmer. "I want to trespass on your premises," he said, "long enough to take a picture of that cornfield. It's the most magnificent one I ever saw." "That's all right," responded the farmer. "But you'll have to take it instantaneous—it's growing so fast."

Little Dick: "Johnny Wheeler has a new bicycle." Father: "Another? What is he going to do with the old one?" Little Dick: "He's goin' to sell it to me as soon as you give me the money."

Prudent Wife: "What have you laid up for a rainy day, John?" Happy Jack: "A mackintosh, my dear."—The Christian Review.

"What's veal, Benny?" "Oh, it's the part of the cow we eat before she grows up."—Sacred Heart Review.

Wear-Proof

Tramp on it, throw live coals on it, let rain, snow, hail and sleet beat upon it; subject it to tests that ordinary roofing could never meet, and still

Pronounced "RU" as in RUBY
RU-BER-OID ROOFING
COSTS MORE - WEARS LONGER

will be unharmed, because it is made to resist the most severe usage. The long life of RU-BER-OID has brought it more than 300 imitators. The U. S. Court of Appeals enjoined imitators from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing.

RU-BER-OID Roofing cannot crack, warp or rot. Cheaper roofings resemble it in appearance, but not in *durability*. Look for the "Ru-ber-oid Man" (shown above) on every roll.

RU-BER-OID Roofing laid more than 20 years ago is still giving perfect service. It is almost repair proof. It is sold by the leading retailers in each community.

RU-BER-OID is made in attractive gray and in colors (Ka-lor-oid)—Tile Red and Copper Green.

California Garden-Flowers

SHRUBS, TREES AND VINES

Being Mainly Suggestions for Working Amateurs.

By Edward J. Wickson,
Hon. President, California State Floral Society.

FIRST EDITION—1915.
262 pages, 5½x7½ inches; illustrated; cloth bound; 12 full-page photo-plates and numerous text illustrations.

This book aims to tell the beginner in California, whether he be a scholar struggling with his school-garden, or a suburban gazing vacantly on his residence lot, or the farm-home maker, who is puzzled to translate his experience with teams, plows and pasture fields into troweis, pruning-shears and lawns, just what to do to make garden-soils, grow plants and surround his abode with beauty under the peculiar climatic conditions of California.

Price, $1.50 per copy, Postpaid.

The Markets.

Unless otherwise quoted f. o. b. San Francisco.

San Francisco, Aug. 25, 1915.

WHEAT.

New developments in the war situation have caused a noticeable weakenlng of the wheat market all over the country, though there is little quotable change locally. California and northern club have receded slightly from the advance of last week. Trading is very quiet.

Sonora	$1.77½ @1.82½
Cal. Club, ctl.	1.77½ @1.80
Forty-fold	1.80 @1.85
Northern Bluestem	1.95 @2.00
Northern Club	1.77½ @1.80
Northern Red	1.75 @1.90

BARLEY.

The scarcity of ships is retarding the export movement, but the shipping grain is steadily held. Feed, however, is easier, with large supplies coming in and no active demand.

Shipping	$1.32½ @1.35
Choice Feed, ctl.	1.20 @1.25

OATS.

The market on oats is considerably weaker than for some time past, but so far there has been no quotable decline in values, though lower prices are expected soon.

Red Feed	$1.35@1.45
White	1.50@1.55

CORN.

Prices remain stationary, and while there is a fair jobbing movement of feed corn, few important transactions arc under way.

California Yellow	$1.80@1.85
Eastern Yellow	1.85@1.90
Milo Maize	1.75@1.80
Manchurian	1.40@1.60
Kaffir	1.80@1.85

BEANS.

Blackeyes have been marked down sharply, and recent offerlngs of red kidney beans have falled to bring the previous quotations. In most other lines, however, the market is decidedly firm in tone, though no advances are reported. This ls due primarily to a heavy movement for export, which has greatly reduced the local surplus. Crops, also, are not looking quite as well as was expected; though the acreage in most varieties is large and the outlook is still for a large productlon. The llma crop in some sections, however, is said to be very llght.

Bayos, per ctl.	$3.75@3.85
Blackeyes	3.00@3.50
Cranberry Beans	3.50@3.75
Horse Beans	1.75@2.00
Small Whites	3.75@3.90
Large Whites	3.50@3.75
Plnk	3.00@3.20
Limas	4.15@4.25
Red Kldney	4.50@5.00
Mexican Reds	4.90@5.00

SEEDS.

There ls practically no movement in most lines, but some large advance contracts for alfalfa seed are reported in the country. New alfalfa will not be offered on the spot for some time.

(Wholesale prices, San Francisco.)

Alfalfa	17 @18 c
Brown Mustard, per lb	Nomlnal
Canary	10 @12½c
Hemp	3 @ 3½c
Millet	2½ @ 3 c
Timothy	7½ @ 8 c

HAY.

Arrivals for the last fortnight have dropped off greatly, and everything is cleaning up without difficulty. It does not look as if offerings would be larger from now on, and with a very firm tone to the market already an early advance is expected. The export movement continues, and has already taken a heavy tonnage, greatly strengthening the situation. Moreover, the alfalfa crop in the valley is sald to be below expectations, which will have a tendency to raise prices all along the line.

(On track, San Francisco.)

No. 1 Wheat, per ton	$11.50@12.50
do No. 2	8.50@10.00
Barley	8.00@10.00
Tame Oats	9.00@12.50
Wild Oats	7.00@ 9.00
Alfalfa	8.00@11.00
Stock Hay	5.00@ 5.50
Straw, per bale	.25@ .40

FEEDSTUFFS.

Rolled barley has been marked down slightly, in sympathy with the whole grain. Other lines are still steadily held, with about the usual demand for this season.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$20.00@21.00
Alfalfa Meal, ton	14.00@15.00
Alfalfa Molasses Meal per ton	18.00@19.00
Bran, per ton	28.00@29.50
Oilcake Meal	38.00@39.00
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	41.00@42.00
Middlings	35.00@37.00
Rolled Barley	26.50@27.50
Rolled Oats	33.00@34.00

VEGETABLES.

Prices show considerable fluctuation, some seasonable lines being plentiful and cheaper, while others are recovering from last week's decline. String and lima beans are both a little lower, and tomatoes are very cheap, with river stock selling as low as 25c. per lug. Green corn also is quite easy, with heavy offerings of only fair quality. Cucumbers show little change, while bell peppers are picking up a little, and summer squash and eggplant are higher.

(Wholesale prices, San Francisco.)

String Beans	1 @ 2 c
Lima Beans	2 @ 3 c
Peas, sack	.75@1.50
Peppers, bell, bx	.25 @40 c
Tomatoes, lug	.25 @65 c
Cucumbers, lug	.20 @35 c
Eggplant, lug	.35 @40 c
Summer Squash, lug	.25 @40 c
Green Corn, sack	.60@1.25
Okra, lug	.40 @70 c

POTATOES AND ONIONS.

The general tendency is downward, with heavy offerings of all lines. A few Salinas potatoes bring fair prices, but river stock is very cheap, and the same is true of onions. Some Bermudas are still in the market, and move very slowly. The most interesting feature is a heavy shipping movement of onions to Australia, though this has not yet stiffened the local market.

Delta Burbanks	.60 @80 c
Sweet potatoes, lb	2 @ 2¼c
Onions, ctl.	.50 @55 c
Garlic, per lb., new	5 @ 7 c

POULTRY.

The demand has been quite active, and while arrivals of both local and eastern stock are large, values in practically all lines are well maintained.

(Wholesale prices, San Francisco.)

Live Turkeys, lb	.15 @28 c
Broilers	.28 @30 c
Fryers	.22 @23 c
Hens, extra, per lb	.16 @17 c
Small Hens, per lb	.13 @15 c
Smooth Young Roosters per lb.	.23 @25 c
Squabs, per doz	$2.00@3.50
Geese, per pair	2.00@2.50
Ducks, young, lb	.13 @14 c
Old	.12 @13 c
Belgian Hares	7 @ 8 c

BUTTER.

The shipping movement to Australia has been interrupted, but there ls still a good deal going to other quarters, and while arrivals are heavy the market shows some improvement, extras being ½c. higher.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	27½	27½	28	28	28	28
Prime Firsts	26	26	26	26	26	26
Firsts	25	25	25	25	25	25

EGGS.

Shlpments, including a good many from distant points, have been arriving rather in excess of requirements, though the local movement is unusually large. Prices accordingly show considerable decline for both extras and pullets.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	31½	30	30½	30	30	30½
Sel. Pul.	27½	27	27	26½	26	25½

CHEESE.

The market seems to be picking up a little, both Y. A.'s and Monterey cheese being quoted higher. California cheddars are now quoted on the Exchange, and whlie offerlngs so far are limited, it is expected that this type will receive increasing attention.

(S. F. Dairy Exchange prices on flats and Y.A.'s.

DECIDUOUS FRUITS.

The movement in the local fresh fruit market continues heavy, and while offerings likewise are large, prlces are holding up very well, some lines showing an advance over last week. Huckleberries and blackberries are firmer, and a few raspberries have sold at stiff prices. Prunes are easier, while plums do a little better. A few fancy figs bring an advance, but ordinary lots are unchanged. Nectarines and peaches have been marked up a little. Fancy pears are easier and there is a good deal of trashy stock that is hardly worth quoting. Some lines of apples are doing a little better than last week, but the market in general shows no strength. Melons are about as before. Some large Persian cantaloupes are appearing, and find a fair market as quoted. Attractive lots of grapes in crates are steadily held.

Huckleberries, lb.	9 @11 c
Strawberries, chest	1.50 @3.00
Blackberries, chest	1.25 @2.00

Muscats	.60 @75 c

DRIED FRUITS.

The trade is still a little uncertain about values, but there is a stronger feeling in regard to the market in general than for some time, and quotations may be considered steady at the old range. Apples are still scarce, and new offerings find ready sale at the range quoted. The firmness in apricots seems to be pretty well established, and fancy moorparks in favorable locations would bring 8½c., though some poor stock is still being bought considerably below this figure. Figs are firm, with shipments from the Orient cut off and some likelihood of a demand from Europe. There has been further European buying of prunes, taking up most of the spot offerings in the east, and buying of the new crop is proceeding steadily at the former range. Prospects of an organization to market peaches have lead growers generally to hold back, and some are asking extreme prices, though there is so far no demand at any advance over the former quotations. Considerable interest has been taken in consuming markets in the new prices on seedless raisins, which are in good demand. Old crop raisins, also, are in active demand for Europe. The New York Journal of Commerce say:

"The spot market on old crop raisins maintains its strong tendency, and with no diminution of European inquiry, and the domestic demand being steadily held, prices have a very strong feeling and stocks are becoming very limited. European sources continue to buy here and shipments are made in fairly heavy quantities with great regularity, according to well posted operators in the market.

"All advices show that the future Prune market is still holding a steady feeling. There is no change made in the quotations being asked. The spot market is being well and buying continues to be restrict- cleaned up by the constant buying in small quantities, which has been in progress for the last month.

"Future Apricots are apparently having no difficulty in maintaining their firm tendency, and, though there is practically no buying reported, there seems to be no inclination tending toward a decline in prices."

lemons from the State continue lively, averaging over 30 cars of oranges and 20 cars of lemons daily. Prices for Valencias continue good and lemons are increasing. On the New York auction, Monday, Aug. 23d, valencias averaged from $3.60 to $5.40 per box and lemons averaged from $1.60 to $3.25. Other auction points paid about the same prices as New York.

The advance at shipping points has been followed by quite a sharp advance in Valencia oranges in the San Francisco market. Other lines are unchanged, lemons and grapefruit being in very good demand in this market.

(Wholesale Prices, San Francisco.)

NUTS.

The almond harvest is now well under way, but none are ready for shipment yet. The Exchange expects to name new prices within a few weeks. Meanwhile buyers are picking up what they can get at widely varying prices. It is reported that the new walnut crop is heavy, but spot prices are altogther nominal.

(Prices f. o. b. San Francisco.)

Southern, year's staple	15@18c
Six months	14@16c

HORSES.

The local market continues dull and uninteresting. A few horses have come in recently, but the offerings have received little attention, and it will apparently be some time before the city demand will call for large shipments. There is a very fair demand in the country, however, and prices are well maintained within the range quoted.

(Approximate values at San Francisco, based on auction sales.)

Heavy drafters, 1700 lbs. and up	$275@300
Light drafters, 1550 to 1650 lbs.	200@225

HOPS.

Picking is now well under way in the Sacramento Valley, where prospects are good. With reports of a shortage in Oregon and a light English crop, the market is strong, and numerous purchases have been made at the last quotation.

1915 crop, lb ..... 13@14c

SPECIAL DECIDUOUS FRUIT REPORT.

By J. L. Nagle.

Sacramento, Aug. 24, 1915.

Peach shipments from California will be light for the next ten days. After that, owing to the indisposition of the canners regarding Clings, it is likely that 300 cars or more of the late varieties will be packed in the regulation boxes and shipped East.

Plum shipments, with the exception of a few of the mountain districts, have practically stopped and this is true also of Bartlett Pears.

Owing to the sugar content of Grapes, both Malagas and Tokays, not equaling the amount specified by law, shipments are very light, consequently the demand is active and the markets strong

There is still an abundance of fruit in the East and the far eastern markets show no inclination whatever towards buying California Peaches.

On account of the great proportion of inferior Bartletts that have been shipped East this season, clean stock was welcomed and buyers paid fancy prices. This condition will continue to rule throughout the season on well colored stock.

Late Plums have not done as well as was expected, due in a great measure to the condition of their arrival, which has been affected either by the extreme heat or over irrigation.

Packers are showing considerable activity in the Tokay districts and we look for a firm, steady market all through the grape season. There seems to be an upper tendency towards the buying of wine grapes and already quotations are out for from $12 to $14 on zinfandels. It is hoped that packers will be extremely careful in putting up Tokays and Malagas this season, as any tendency towards over-crowding the market with inferior stock will surely bring disastrous results. As the situation faces us now, we anticipate a strong demand on the two varieties of grapes in which California is most interested.

The following have ruled for the week:

New York.—McDevitt Peaches, averaged $1.15; Albright, $1.35; Elberta, 40c.; Crawford Clg., 90c.; Duke Plums, $1.05; Kelsey, 90c.; Giant, 75c.; Diamond, 90c.; Bartlett Pears, $2.12; B. Hardy, $1.42; Tokay Grapes, $2.64.

Chicago.—Bartlett Pears, $1.64; Elberta Peaches, 56c.; Crawford, 40c.; Malaga Grapes, $1.49; Tokay, $1.74; Kelsey Plums, 99c.; Hungarian, 96c.; Duke, 97c.; Giant, 88c.; Gross, $1.00.

Boston.—Bartlett Pears, $2; Kelsey Plums, $1; Gross, 97c.; Grand Duke, $1.05; Giant, 80c.; Hungarian, 83c.; Elberta Peaches, 48c.; Crawford, 48c.; Malaga Grapes, $1.43.

Total shipments to date, 6863 cars. Total shipments to date, 6863 1914, 7698 cars.

CALIFORNIA ALMOND GROWERS' EXCHANGE

311 California Street, San Francisco, Cal.

Publisher's Dep't.

Reports come to us frequently of the fine results Rural Press advertising is bringing. During the past week, we have heard from two stock advertisers each of whom are represented in our liner department. E. C. Rand of Santa Rosa, a purebred Berkshire breeder, after trying out several mediums, has decided to use the Rural Press exclusively in the future. C. E. Barrows of Los Molinos reports receiving four inquiries through the Rural Press to one from other journals. He has sold over $600 worth of purebred hogs as a result of a liner costing $14. Every breeder of registered live stock in California should use either display space or the liner department in this paper.

In this department last week the printer made us say that the new "California Hog Book" would be sold at $1 per copy. The price should have read $2 per copy postpaid. Work on the book is progressing nicely and we anticipate issuing a handsome volume, chuck full of information to the hog breeder. Remember the price is $2 per copy.

W. J. Warnock of Ramona writes: "One copy of the Rural Press is oftentimes worth more than a whole year's cost to me."

One Nevada subscription solicitor sent us in forty-four new subscribers as the result of his work last week.

MEDICAL USE OF A SHEEP.

Battle Creek, Mich., boasts a scientific sheep—a sort of a b-a-chelor of science. His name is Sam and for a number of years he has been an important member of the scientific staff of a local sanitarium, giving much and exacting little, and always on the job whenever needed.

"Scientific Sam" serves in the capacity of an experiment station. He supplies blood by comparison with which, in a blood testing technique, the state of health of sanitarium patients is partially determined. By reason of these tests, Sam's blood has mingled freely with that of many blue-blooded health seekers who have gone there for treatment.
